By the way, is it not about time that some of our contemporaries dropped their silly girding at the *Gazette*? Comparisons are proverbially odious, and 'Mrs. Prig,' 'Mrs. Harris' or 'Mrs. Martha Brown' take up little more type in printing, than 'Mrs. Gamp.' Whatever may have been the standing and reputation of the *Gazette* in former times, it is undeniable that it is now—to say the least of it—as well edited, as well printed, as properly conducted, and as accurately informed, as any paper in China or Japan. It has certainly, during the last twelve months, initiated a number of improvements in its commercial, advertising, and general information columns, which its local contemporaries have been eager to imitate; and its leading columns have contained articles on subjects specially interesting to a mercantile community, which have been written with great power and have displayed thorough soundness of view. We have sincerely regretted, often, that we have not had them for our own columns. More than once lately, its proprietors have put themselves at the head of useful movements which would otherwise have languished, (what a boon they have conferred on Yokohama, for instance, by assisting the publication of this Review!) and their action now, in bestirring themselves to get the settlement out of the slough of municipal misgovernment should be greeted with acclamation, not received with a sneer. Of course, there will be a general snarl at this paragraph, intensified probably by a cartoon in *Punch*; but—*Fais ce que dois: advienne que pourra*—and we have a perfect and comfortable confidence that we shall be believed by all whose opinion is worth having, when we say that we should have written exactly as we have done, of any other paper equally deserving and as undeservedly maligned. We cannot see that—because we are under obligations to the *Gazette* which we can only repay by gratitude—we are to be debarred from saying a word in its behalf, when under its present management, it disdains to speak it for itself.

There has been a rather singular dearth of incidents of any kind this week. On Monday, the New Imperial Telegraph establishment was opened at Tokio: but we described what the ceremonial was going to be, in our last, and as that statement was correct, there is no object in repeating it now. We should have been happy to have given a more detailed account of it; had we received a invitation to attend, which we could accept; but the Japanese have yet to learn how to treat the Press with proper courtesy. It is to be regretted that all the other foreign newspapers did not treat the 'invitation' sent to them in the same way as ourselves.

On the same day a more interesting ceremony, a review of the Imperial Guard, was attended by the Mikado, followed by a parade of convalescents from the civil war of last year, who were personally thanked by his Majesty for their devotion, and congratulated on their recovery. The weather was most unfavourable, and the spectacle consequently lost much of its attraction; but the troops turned out in a very workmanlike way, and marched past in fair style. It is reported, by the way, that a change in the tactical system is to be adopted, that of Germany being substituted for the present drill, which is founded on that of the French Army under the Empire.

An advertisement has been staring us in the face during the week which recalls to memory a great disaster—the foundering of the *Nii* in March 1874. Her wreck and cargo, as they lie at the bottom of the sea off Cape Idzu, were sold on the 26th inst. to two separate purchasers, for \$760 altogether. Japanese divers have been long at work upon the wreck, however; a good deal of it has been blown up; and much of the cargo removed by them; so that probably the sum given is not very much under value.

A terrible calamity of a similar nature,—the loss of H. M. S.

training ship *Eurydice* with 400 men, in the West Indies,—is reported by telegraph. As we have no details, we are left entirely to conjecture as to the cause of the accident, but the locality of course suggests that she must have been caught in a tornado: One of her officers, the paymaster, Mr. Frank Pittman, was formerly in charge here of the Navy yard. The *Eurydice* was one of the finest ships ever turned out of an English dock yard, a real model, designed by Admiral Hall, of the *Inconstant* and *Phaeton* class, and we remember that experiments were made with her when she was first built, which went to prove that to capsize her was an impossibility—but some fatal alteration was evidently made in her masting, or ballasting, when she was recommissioned for this cruise, in 1877. The loss of her crew at the present juncture of affairs in Europe is most serious: they were all of the very blossom of the rising generation of British seamen, and this was their final training cruise before being drafted out to different ships in the Navy.

Last week we had a note about the Boat Club; and were glad to be able to congratulate its members on the flourishing condition of their Association: the weather has been favourable during the past week for laying down the landing stage, and we shall soon be able to chronicle the proceedings of the opening night, which is fixed for the 6th proxo. Meanwhile we are glad to see that the Cricket Club has inaugurated the season by holding its annual meeting, at which a return of five dollars per share was made to the scripholders and that a good balance remains in hand. A most sensible proposition was put and carried—introducing lawn-tennis apparatus, without a lawn tennis Club. It is awfully ungallant to say so, of course; but we have always held the belief that lawn-tennis with ladies is only a degree better than battledore and shuttlecock. Tennis proper is certainly—bar boxing—the most violent exercise going, and properly played, with well matched men, lawn-tennis is a remarkably good imitation of it. But to see men, as we have seen them here, pretending to play lawn-tennis without even taking off their coats, and affecting to like it, seems to us such absolutely transparent humbug, that the most remarkable part of the performance is the success with which the players keep countenance.

The few who remain of that fast-thinning band of brothers, the old residents of Yokohama, have welcomed back with cordial pleasure Mr. J. S. Barber, formerly the head of the firm of Ross, Barber and Co., who arrived in the *Glenartney* on the 27th instant, to take charge of the house of Malcolm, Wilcox and Co. Mr. Barber must see such changes in the town since he left it ten years ago, that he will hardly know it again; but he finds no change in the feelings with which he was always regarded by his friends. Does anyone, we wonder, remember a prologue to a theatrical performance in the very early days, in which the name of his firm was of great use in pointing a couplet:—

"And 'twould be heaping Pelion on Ossa,
If Ross and Barber shone in Barbarossa."

Ah! the good old times, when we listened to the chimes at midnight, had a mail once a month, and made money faster than we could spend it!

NOTES AND QUERIES.

QUERIES.

Qy. 2. Where can I find any account of the ceremonies in use on the occasion of birth, death, or marriage, among the Japanese? Do any of the French, Dutch or German works on Japan contain such? I fail to find any information on the subject in English books. A work like Sir John Davis' "The Chinese" is a great desideratum in Japan.

(In process of answer.) B. H.

Qy. 6. Can any of your readers inform me whether there are any, and if so, what books on Japanese surgery, or midwifery, as practised before the coming of the Dutch and Portuguese?

(Unanswered.) Z.

Qy. 8. Mr. Bramsen's interesting note on the relative values of coins in your issue of February 23th, leads me to think that he may possibly be good enough to clear up a few points which have frequently occurred to me:—

1.—Can he say when, and under what circumstances, paper money was first issued in Japan? "Shosei" in

your issue of March 9th gave a most interesting account of the *Han* paper money; and perhaps if there were a general issue before that, Mr. Bramsen may be able to do the same for it.

2.—Copper was first coined in Japan, I believe, in the Wadô period (708-715); does Mr. Bramsen know whether the nominal values of the coins made then, and also up to the time of Nobunaga, were restricted to the same denomination as afterward? The Tempô was of course named in the Tempô period (1830-1844).

3.—Can he give any account of the regulations (if any) which governed coining under the feudal system? For instance, under what circumstances was permission granted to certain individuals to strike coins? This seems to have been done at various parts of the country, thus we have Musashi Ichibu, Suruga Koban, &c., I trust that Mr. Bramsen will pardon the liberty I take in addressing myself to him; but if he should ever put a query in "Notes and Queries" which I can answer (which is doubtful), I promise him that I shall do so to the best of my ability.

It may interest coin collectors to know that a collection of copper coins, which consisted of eighty-six specimens; four of which were said to belong to the eighth century of the Christian era, six to the ninth, two to the tenth, two to the sixteenth, thirty-five to the seventeenth, and the remainder to the eighteenth and nineteenth centuries, was offered for sale a few months ago in Tokiô for twenty *yen*.

X.

Qr. 9. I want information as to the locality of the signature of the original Treaty with Japan by Commodore Perry. Treaty Point, a mile or so away from the town indicates the spot: but was the treaty signed there in the Temple at Homoko, near which the butcheries now stand; or was it under a group of trees which stood on the site of the present British Consulate? I have heard both places assigned as the scene of the transaction. B. A.

NOTES.

NOTE. [Comparative values of money in Japan at various periods.]

Dear Sir,

While acknowledging with many thanks the information kindly furnished, through the medium of your columns, in reply to my queries about the value of money 500 years ago, I must confess that I have been rather puzzled by a statement contained in one of your contributor's notes—viz—that *oban* and *koban* "were for the first time coined by Nobunaga in the period *Ten-shô* (1573 to 1591)."

Is not this contradicted by the following coins? The *Yei-ji koban* or *Hidehira koban*, coined A.D. 745 by Hidehira, Duke of Mutsu, and paid in tribute to the government—(of this piece there were several varieties).

The *Jiye koban*, coined between 1181 and 1183; The *Hori-kawa koban*, current during the reign of the Emperor Horikawa (1086 to 1105). (three varieties);

The numerous *kobans* coined at Odawara under the Hôjô rule;

The *Zen-kô koban* and *Yoshi-mame koban*, current under the Ashikaga rule;

The *Tai-hei koban* coined by Nikki Yoriaki A.D. 1367;

The *Sei-chô* or *Shô-chô koban* coined between 1427 and 1428;

The *Kiyo-raku koban* (1527 to 1530);

The *Yei-shikwan oban*, coined 1548 at Suruga by Imagawa Yoshimoto;

Besides a number of others, whose exact dates I do not know but which are said to have been in circulation before 1550 A.D. e.g. the *Kô-kin koban* and *Takeda bishi koban* (current in Koshû); the *Adzuma koban*; the *Chi-ba Ji-miyo koban* (of which some were marked with crescent moons and some with a number of circles touching internally); the *Koyasu koban* (the most highly ornamented of all the gold coins); the *To-zasa koban* &c. &c.

"X" was certainly misinformed about the date of the *Ken-ji koban*, but has Mr. Bramsen found quite reliable authority for his statement that during the 13th century (and a fortiori—before that era) copper cash only were in

use? If so the author of the 'Times of Taiko' is wrong when he represents Ishikawa (exiled from the Court of Horikawa) as carrying with him some "parcels of gold pieces."

Yours very truly

N. or M.

Yedo, 24th March.

THE TIMES OF TAIKO.

(FROM THE JAPANESE.)

BY F. BRINKLEY, CAPT. R. A.

ISHIKAWA GOYEMON.

Chapter XIII. THE MUSASHI KOBAN.

OF the nobles who were indebted to him, Hidetsugu selected only the most important. Several were absent in the provinces, and of the rest some were at Kiyoto and some at Fushimi, so that by the following evening it was only possible to assemble eight earls, an equal number of Barons and some thirty-four bannerets, nearly all feudatories of the Regent.

Such a meeting of noblemen had not taken place at the palace since the Imperial progress six years before. It was destined also to be the last gathering of the sort that should ever muster within those splendid precincts.

Night had long fallen before the last of the arrivals was announced; one of the summer nights when nature seems to be dreaming of her own beauty. The mysterious moonlight, peeping furtively under pines and among rockeries, shrank from the monstrous and awesome shapes its touch created, and nestling for a time, in its slow ascent, among the soft foliage of the bamboos, till each feathery tress glowed like the spray of a crystal cascade, crept at last over the bosom of the lake, where it lingered contentedly among the shadowy memories pictured in the water's placid depths. It was a time to make age melancholy or youth mirthful, and from the tea-houses on the banks of the distant river and the gondolas that floated down the stream, the notes of a hundred guitars and a thousand voices of song and laughter blended into one deep, joyous hum, that stole across the palace gardens and into the very presence of the solemn conclave within.

Hidetsugu had dismissed every officer of his household; not even a page remained at his side, and this, added to the lateness of the hour and the imposing nature of the meeting, filled those present with wonder and anxiety. None had even ventured to conjecture the purpose that had summoned him, and amid the profoundest silence, the Minister, his face pale and his voice tremulous, addressed the fifty nobles:—

"My Lords, I must apologize for the sudden and peremptory nature of my summons, and thank you for responding to it so promptly. And first let me ask you to forget that I am Taiko's adopted son and the Prime Minister to whose safeguard His Majesty the Emperor is committed. I wish for the moment to lay aside all this, and address you as a friend speaking to the friends that aided me to support the cares of government during the three years of my Regency. My Lords, the hopes I was taught to foster when I first became Minister have ceased to exist. If I seem to tell you this with any reluctance, I pray you to believe that it is caused by shame for those who have deceived me, rather than regret for myself who have been deceived. Since the birth of Hideyori, I have been so oppressed by the shadow of a harsh autocracy, so harassed by vexatious and humiliating inquisition, that finding myself still submissive, I begin to ask whether men call me base or patient. But the end has come, and it finds me neither able nor anxious to escape. For under the pretext of obtaining funds to defray the expenses of the Chinese embassy's reception, an official enquiry is about to be made into the state of this treasury. I need not remind you that a large deficit exists, nor explain to you the cause of its existence. Neither need I tell you that there are reserves at both Fushimi and Ozaka, from which money, were money really needed, could be easily and with propriety drawn. The Regent and his counsellors are not proceeding unadvisedly, and that their reasons do not lie on the surface of their actions is perhaps fortunate for the respect men owe them. This financial audit must inevitably lead to my disgrace, for I will never implicate you to justify myself. The money indeed was at my disposal, no less than this palace is

and to what better purpose could it have been applied than the relief of those who constitute the props and bulwarks of the Government? But I am prejudged. The Regent desires my overthrow for Hideyori's sake, and seeing this, my course would be clear if filial duty only were to be consulted. But my country too has its claims. Hideyori is still a baby. Could I reasonably hope that his majority might find Taiko still surviving, every wish would be satisfied; but this is impossible, and with bitter regrets I foresee a long interregnum of anarchy and bloodshed. To obey my father then, I must be a traitor to my country, or if true to my country, I must resist my father. In this dilemma, expedient, I confess, fails me, and filial instincts prevail. I am determined to make myself alone responsible for the deficit in the treasury, and then, returning to His Majesty the insignia of my office, I shall seek to forget injustice and the caprice of power in some monastic retreat. It was to explain this to you, whose good opinions I value, no less than to bid you a last farewell, that I summoned you here to-night."

Appealing to many sentiments, distinct yet inexplicit, gentle yet passionate, this speech found its audience fearful and left them faltering. These, filled with shame at the thought that a kindness done to themselves should induce another's ruin, revolved only some means of restoring the borrowed money; those, influenced in part by Hidetsugu's sophistry, in part by their own convenience, began to cast up the chances of substituting their benefactor for his persecutor, while not a few contrasted the unaffected nobility of this Minister with the vulgar self-assertion of the upstart Taiko.

But none of these opinions for the moment found expression. Each of the nobles sat with bowed head, expecting his neighbour to speak, and Hidetsugu, too proud to supplement his statement, awaited the earliest words of reply in such painful suspense that he could almost have chosen to prolong the silence, for instinct told him that the many currents of feeling his speech had excited, would certainly set towards the first outlet they found.

Among the fifty nobles however, there was one who deciphered the truth by the light of his own devotion to Taiko and his knowledge of Hidetsugu's dissipated life. H'totsz Yanagi, Earl of Saijo, turned and addressed the meeting with an assured distinctness that afforded a strong contrast to the Minister's nervous ambiguity.

"My Lords," he said, "our duty is, I think, very plain in this matter. If we owe any respect to His Highness the Regent or gratitude to His Excellency the Minister, we must save the one from being the dupe and the other the victim of false advisers, for I suppose that none of us will attribute this audit to the Regent's unbiased action. The danger is fortunately as easily averted as it is distinct. We have only to return the money His Excellency so kindly lent us, and which in such a crisis we shall certainly find means to collect."

Freed from all the glamour of sentiment and sophistry, the truth sounded so simple and strong, that when H'totsz Yanagi ceased speaking, every one of the assembled nobles gladly signified his acquiescence. Several indeed, declaring their desire to take steps for the collection of the money without a moment's delay, asked permission to retire at once, but Hidetsugu detained them. He was overwhelmed with disappointment and mortification. All the deeper import of his words had been tacitly put aside, all the carefully adjusted pathos of his appeal had not excited a single expression of sympathy or affection, and this discovery of the absolute nullity of his personal influence was perhaps bitterer to him than even the lapse of those hopes whose strength he now first appreciated.

"I thank you, my Lords," he said, "for the aid you offer, but you will oblige me more by not urging its acceptance. It can only bring a temporary relief, and would deprive me of a pleasant memory I desire if possible to preserve. I am, as I have said, prejudged, and I had rather my condemnation were based on a deed of benevolence, than on some imputation too cunningly devised to be completely rebutted. My object in lending was to help, not to embarrass by a demand of sudden repayment. Let things, therefore, I pray you remain as they are, since I am but one to suffer, while you, and those whom the collection of this money might distress, are many; and give me rather in return the assurance that after I have ceased to be your Minister, I shall still retain your esteem."

"Your Excellency asks for what you already possess," said Tautsu, Earl of Iga, "and at the same time would prohibit us the only means we have of in some sort proving our gratitude. The one right and honorable course has been pointed

out by the Earl of Saijo, and though your Excellency's generosity induces you to adopt a different view, I am persuaded that in the end you would little value the devotion of those who failed to follow H'totsz Yanagi's suggestion."

This speech was confirmed by universal acclaim. Hidetsugu scarcely found it possible to obtain a hearing for further protests, and seeing that the meeting had determined to give his denial the interpretation of mere generous reserve, he at last reluctantly held his peace and suffered the nobles to take their leave.

These were the men he had counted to see in the vanguard of his allies when the lists were marked for the final struggle. These were the men! He watched them one by one as they disappeared from his presence and his hopes, till their places were occupied by solitude and the pallid moonlight alone. He had tasted the bitter and the sweet, had looked in the face of pleasure and of pain, but never till that moment had he experienced or conceived the agony of utter loneliness. And yet the thick palpable darkness that, in this extinction of his hopes, seemed to flow in from all sides and blind him irremediably, was less terrible than the aspect of his haughty self-respect thrown down and writhing under the shame of mistaken confidence and abject failure; so that in the bitterness of his soul, he would gladly have exchanged all that remained to him in the world for the ability to overwhelm the memory of his humiliation in some loud and crashing catastrophe.

Such tumults do not pass away from the heart like the simple modulations of sorrow or joy. They leave behind a vibration that suddenly and at unlooked for moments swells out into harsh discord with the happy moods of life, changing sounds of pleasure and delight into echoes of remorse and misery. A mischief frequently of saddest sequel; for to sensitive minds this destruction of nature's rhythm is so intolerable, and get so beyond the help of reason, that instinct often creates, as remedy, some strange and shocking conception, some image of death and oblivion, which for the moment indeed steps in between sense and memory, but which, though in its early days a mere empty sound, a random note of fancy, recurs with more and more strength and frequency, until it grows at last into the monotone of the murderer's or the suicide's mania.

Shrinking from the reality of existence, Hidetsugu sat, hour after hour, motionless and apparently unconscious, till the shadow of the eaves had crept over half the silvery face of the lake, and the voices of life and joy, passing far into the distance, had made room for the silence of a summer night, a soft, dreamy silence, broken only by the boom of the beetle, or, at times, the weird bark of a fox.

Pages and chamberlains, coming in, watched their master with a feeling of awe and uneasiness, but no one ventured to disturb him, until at midnight, after a whispered conference with his fellows, one of the pages made his way to the ladies' apartments, and presently the sounds of a harp lightly touched reached Hidetsugu's ear. The result showed how well his servants understood the Minister's disposition, for almost the very first note roused him from his reverie, and half an hour later this capricious nobleman was dancing and singing as though life had no aim but happiness.

But the nobles, who, if they had availed themselves of Hidetsugu's complaisance at a moment of unusual financial embarrassment, caused by the war imposts, were yet for the most part in a condition to make speedy restitution, issued the necessary orders that very night to their comptrollers and agents, so that in a few days the deficit in the Treasury had diminished to a merely nominal sum.

Nor did this satisfy those—and they were not a few—whose friendship for the minister reached beyond the solution of his present difficulties. The Earls of Iga and Yetchiu visited the monitors, and describing the circumstances of the meeting, entreated them not to rest till they had dissipated the treasonable feelings Hidetsugu evidently harboured.

Kimura and Tajima therefore hastened to the palace, determined to offer a last protest, and one which should at least run no risk of failure from lack of force. Scarcely noticing Hidetsugu's pallor, and the traces of mental suffering his face showed, Sir Tajima reproached him in the plainest language for the policy he had adopted in his interview with the nobles. "We can no longer believe," he said, "that your Excellency's motives in making these loans was charitable, nor can we doubt that the ruling principle of your present conduct is treason. You occupy a position beyond which the ambition of man ought

not to reach, and yet by your own want of judgment you assist those who seek to deprive you of that position, and obstruct those whose aim is to preserve it to you. Which does your Excellency consider the more culpable—subjecting the nobles to the slight inconvenience of returning what they have borrowed, or exciting them to rebellion against their master and your father? If your Excellency finds any difficulty in determining, it has not been so with the nobles, of whom some are hastening to discharge their obligations lest they should be involved in your disloyalty, and the rest, because pity for your errors has been added to their friendship. Be advised then by their example, and for your children's if not for your own sake. There is still time, there is always time, to turn back from the path of evil, and many have won more praise by repentance than by a blameless life."

"Tajima," replied Hidetsugu, "if I do not adopt your advice, it is because I know you misinterpret my motives. So far from bearing, the Regent ill-will, I would gladly give him my life to-morrow if he required it. It is true that he allows himself to be misled by false reports and slanders: it is true that, impelled by a love of ostentation and a thirst for fame, ill becoming his old age and his humble origin, he has sacrificed the lives and squandered the treasures of thousands of his countrymen in a useless war beyond the seas, instead of seeking to secure for the empire the peace and rest it so much needed after years of internal trouble. But all this is as nothing compared to the infatuation which prevents him from foreseeing the anarchy and confusion that must accompany Hideyori's minority if I am removed. These dangers alone disquiet me, and if any reliable plan of averting them can be found, I will be the first to adopt it, even should it involve my own resignation. With this object I sought to induce the nobles, not to revolt, as you say, but to make some representation by which the Regent might be convinced of his errors. 'These are my true sentiments,' continued Hidetsugu solemnly, taking a sword from the alcove and placing it with its hilt towards Sir Tajima, "and if you still doubt my loyalty, with this blade deprive me, I entreat you, of the power to injure the Regent or my country; but if you believe, help me in my good purpose, instead of obstructing me by suspicion and accusation."

"If after this statement of your Excellency's views the monitors still refuse to support your patriotic aims, they must not be surprised though men mistake their so-called devotion to the Regent for selfish timidity," said Kumagaya, the vice-comptroller, who since his mission to the palace two months before had been a constant visitor of the Minister's.

"Kumagaya," replied Sir Kimura sternly, "we are content to incur greater risks than that. A thousand fair words are to one true deed as the snapping to the joining of a hair. When the Minister has purified his private life, we will believe in the sincerity of his patriotism. How can he hope to command men's esteem or obtain their confidence if in spite of duty and promise he has not the moral strength to part with one woman amongst a score. The action he has taken about Tarao's daughter is not unknown to us and it has banished our last hope of saving him."

"Be it so," said Hidetsugu. "I accept the challenge whatever be the cost. Let the result prove my truth and your loyalty." And with these words he dismissed the monitors, little knowing that it was the last time these faithful men should ever unite their voices in his behalf.

These events—the assembly of the nobles, Hidetsugu's attempted treason and the subsequent repayment of the loans—remained entirely unknown at the Regent's Court, and Ishida, never doubting that a large deficit still existed in the Treasury, devoted all his energies to accelerating the despatch of the Commission of Examination. At the last moment, however, he saw himself threatened with a complete failure, for Taiko chose as Commissioner, at his own request, the Chief Marshal, Nagamasa Earl of Seta, who was not only a friend of the Minister, but also a prudent, peace-loving old officer, very capable of conducting the investigation in such a way as to avoid exposure or complication under every circumstance.

Immeasurably mortified by a check that repulsed all his influence and resources, Ishida was fain to content himself with an attempt to neutralize Nagamasa's action by attaching to him one Fukuhara in the capacity of teller for the sum to be transferred to Fushimi—a remedy more sanguine than certain, for though Fukuhara was furnished with the most stringent injunctions to be present at the examination

of the Treasury, the possibility of his obedience must depend entirely on Nagamasa's complaisance.

The appointed day arrived and the Commission set out a little after sunrise. The duty to be performed was of a very tedious nature: first, the verification of the whole reserve fund, and then the counting and withdrawal of the three hundred thousand riyos required. But even while foreseeing the delay all this must involve, Ishida resolved to await the result at the Regent's castle, in obedience partly to his own keen anxiety, partly to his principle of entrusting to others no portion of his enterprises but their history.

Nagamasa must either report the whole deficit or conceal it altogether. He could not adopt any medium course. In the latter case the end might be still long deferred, but in the former, Hidetsugu's downfall was immediately certain. Neither policy nor partiality could save him, and at this thought Ishida passed from the pain of suspense to the ecstasy of anticipation. But what would be the fashion of his fall? Degradation and banishment, or a traitor's death? A traitor's death involving the execution of all his household and therefore of—. Impossible! Whence had this frightful conception suddenly sprung up? Had not such a contingency always existed, and had it not been contemplated and provided for? Surely it had, and yet from some cause it presented itself now with a persistency and power that divested it of all hypothesis. Could it be that, like some senseless insect weaving webs which imprison itself while entangling its enemies, his plots, too sure and comprehensive, would at the last defy their author, and rob him of the jewel whose lustre he had pursued, till, becoming the one and only light of his life, all around and beyond it was darkness and gloom? Pshaw! A mere chimera; a device of fancy to make the result sweeter! There could be no real difficulty in saving Chika, whatever was her master's fate. She was but one amongst forty: a unit insignificant and unnoted. "Unnoted," he repeated to himself, "yes, surely unnoted, but"—and a sudden fire blazed up into his brain, for in an instant the phantom his instinct had felt approaching stood before him, palpable and appalling.

Chika's name had been officially mentioned to the Regent and Hidetsugu's excesses ascribed in great part to her influence. Her fate was therefore inseparably bound up with his, and if he died, she must die too.

Oh! miserable end of a life-long effort and hope; bitter beginning of deathless remorse and regret! Strange and incredible, he had kept his gaze so firmly fixed on the goal, that this abyss in the way had utterly escaped his notice. He could not frame any scheme to avoid it, for always when he seemed to be approaching some expedient, the terrible alternative that failure involved would burst in upon his thoughts and scatter them in confusion and horror. So, devising and despairing, struggling and succumbing, he passed the long hours of a day that was destined to find many a parallel in the sequel of his life.

About two hours after sunset, the tramp of horses' feet and the monotonous cadence of coolies' voices heralded the return of the commission. Ishida, veiling his excitement as best he could, uncertain what issue he now desired, but always cursing his own want of providence, moved to the vestibule, and saw by the glare of numerous pine torches that illumined the court-yard, a band of men in the act of depositing six large cases carefully fastened and distinguished by a government flag attached to each of their bearing-poles. The treasure then had come, but what of the deficit?

Preceded by two lamp-bearers, a man separated himself from the crowd and approached the vestibule. It was the Earl of Seta; moving so calmly and with such vexatious deliberation. Detaching his sword from his girdle, he handed it to a servant and approached Sir Ishida.

"You have had a fatiguing day, I fear," said the Baron with a bow.

"Yes," replied Nagamasa. "I had almost thought of deferring my report till to-morrow, but the Regent may be anxious. Do you know whether I can see him at once?"

"I should think so," answered Ishida, not trusting himself to ask any questions, but conjecturing much from the Earl's composure. "If you allow me, I will accompany you," and the two noblemen took their way to the Regent's room.

Taiko was sitting reading. He looked very old and insignificant, for with his head bowed over his book, the one feature that redeemed his vulgar, ill-favoured face was concealed. But what a change when he closed his book and looked up at his visitors! An eye so luminous with genius

and resolution that of those who met it, some were dazzled and the rest fascinated. One saw no more the large mouth and heavy jaw; the short, flat nose and high cheek-bones; the undignified head and diminutive stumpy figure; but only the fearless general and arrogant dictator, the meteor that had flashed suddenly from the veriest depths of obscure serfdom into the zenith of rule and renown.

He acknowledged his visitors' obeisance and waited in silence to hear Nagamasa's report. Ishida remarked that his face, unusually pallid and care-worn exhibited less interest than lassitude as he turned it towards the Commissioner.

"In pursuance of your Highness' orders," said Nagamasa, "I have to-day performed the examination of the Treasury at the Palace of Pleasure. The amount I was instructed to transfer to your Highness' private chest, namely three hundred thousand riyos, being deducted, there remains in the coffers at Kiyoto,"—here Nagamasa, untying a silk wrapper he carried in his hand, took from it a paper which he proceeded to unfold and examine with a leisurely formality that inflamed Ishida's impatience almost beyond endurance—"there remains in the coffers at Kiyoto," he repeated, "the sum of two hundred and eighty five thousand five hundred and twenty riyos."

With all his self-possession, Ishida could not restrain a start so violent that it elicited from the Regent a glance of astonishment, and from Nagamasa a smile half amused, half derisive.

"So that," said Taiko "the total sum you found in the Treasury amounts to—?"

"Five hundred and eighty five thousand five hundred and twenty riyos," replied Nagamasa, presenting the paper he carried to the Regent.

"Is that correct, Sir Ishida?" demanded Taiko.

"Perfectly correct, your Highness. It is the exact sum the Treasury contained at the time the palace was handed over to His Excellency, the Minister," replied Ishida with a feeling of relief that astonished himself. Almost unconsciously he had so associated Chika's fate with this report, that for the moment entirely oblivious of the defeat his schemes had sustained, and the discredit his false representations must entail, he only saw himself acquitted of his love's murder.

Taiko remained for a short time buried in thought, and then suddenly asked:—

"In what form is the money you have brought, Nagamasa?"

"In gold coins, large and small, your Highness," replied the Earl with astonishment.

"I should like to see some of the smaller parcels," said Taiko. "Will you be so good as to have a few brought in. And if possible," he added as Nagamasa was leaving the room, "select those that look newest."

In a few moments two men entered carrying a tray, upon which were spread some half score rouleaux carefully sealed and stamped. Taiko chose a packet at random, and cutting it open, examined the contents minutely. Apparently not finding what he sought, he subjected another and yet another to a similar scrutiny, selecting at last from the third a piece which he handed to Ishida, saying:—

"What do you make out this coin to be, Ishida?"

"A Musashi Koban," replied Ishida, who saw at once by the stamp that the piece was one of a number struck four years before.

"With that coin in your hand then," continued the Regent, "you might be disposed to supplement the report Nagamasa brings."

"Your Highness," said Ishida, and though he spoke in a low reluctant tone, each of his words sounded strangely sonorous and explicit to his own ears, "I should feel obliged to add that the reserve fund was lodged in the palace Treasury seven months before the issue of this coin."

(To be continued in our next)

EXTRACTS.

THE HONGKONG RACES Feb. 28th, March 1st—3rd.

[We give the following brief record of these races, for convenience of future reference and comparison by our Yokohama sportsmen.]

First Day, Feb. 28th.

1. THE WONG-NEI-CHONG STAKES. Six starters.

Temptation, 11st. 1lb. 1. *Mr. Toots*, 10st. 12lbs. 2. *Sambroco*, 10st. 12lb. 3.

Half-a-mile. 1 min. 6½ sec.

2. THE COLONIAL STAKES. Three started *Warlock* pulled up. *Boomerang*, 10st. 7lbs. 1. *Dynamite*, 10st. 7lbs. 2. One mile. 3 min. 14 sec.

3. THE ASHLEY CUP. Five started.

Scylla, 10st. 2lbs. 1. *Black Satin*, 11st. 1lb. 2. *Scud*, 10st. 9lbs. 3. One mile. 2 min. 22½ sec.

4. THE HONGKONG DERBY. Seven started.

White Velvet, 10st. 7lbs. 1. *Spurs*, 10st. 7lbs. 2. *White Lily*, 10st. 7lbs. 3. *Bay Rum*, 10st. 7lbs. 4. One mile-and-a-half. 3 min. 41 sec.

5. THE FOCHOW CUP. Four started.

Egmont, 11st. 11lbs. 1. *Jamboree*, 10st. 9lbs. 2. *Cassacou*, 11st. 4lbs. 3. *Smike*, 11st. 1lb. 4. Two miles. 5 min. 3½ sec.

6. THE GARRISON CUP. Three started.

Claymore, 10st. 6lbs. 1. *The Nob*, 10st. 6lbs. 2. *Boomerang*, 10st. 6lbs. 3. One mile and a half. 3 min 15. 4.5 sec.

7. THE VALLEY STAKES. Twelve started.

Martingale, 10st. 9lbs. 1. *Black Velvet*, 11st. 1lb. 2. *Ariel*, 10st. 12lbs. 3. One mile. 2 min 25. 4. 5 sec.

8. THE SLASHERS CUP. Seven started.

Bay Rum, 10st. 12lbs. 1. *Fiasco*, 11st. 3lbs. 2. *Whipcord*, 11st. 1lb. 3. One mile and a quarter. 3 min. 2½ sec.

9. THE CANTON CUP. Eleven started.

Allendale, 11st. 1lb. 1. *Twinkle*, 10st. 12lbs. 2. *White Velvet*, 11st. 4lbs. 3.

Three quarters of a mile. 1 min. 44½ secs.

Second day. March 1st.

1. THE SCURRY STAKES. Six started.

Allendale, 11st. 1lb. 1. *Cockchafer*, 11st. 1lb. 2. *Quicksilver*, 11st. 4lbs. 4. Three quarters of a mile. 1 min. 41 sec.

2. THE GERMAN CUP. Seven started.

Scylla, 10st. 12lbs. 1. *Suavita*, 11st. 1lb. 2. *Jamboree*, 10st. 9lb. 3. Two miles. 4 min 46. 4.5 sec.

3. THE NAVY PLATE. Four started.

Whipcord, 11st. 1lb. 1. *White Velvet*, 11st. 4lbs. 2. *White Lily*, 10st. 9lbs. 3. *Allendale*, 11st. 1lb. 4. One mile. 2 min. 19 sec.

4. THE PARSEE CUP. Three started.

The Nob, 10st. 6lbs. 1. *The Babe*, 10st. 13lbs. 2. *Boomerang*, 10st. 10lbs. 3. One mile and a half. 3 min. 10 sec.

5. THE BANKER'S PLATE. Six started.

Temptation, 11st. 1lb. 1. *Scylla*, 10st. 12lbs. 2. *Black Satin*, 11st. 1lb. 3. One mile. 2 min. 15 sec.

6. THE BROKER'S CUP. Eight started.

Ariel, 10st. 12lbs. 1. *Deron*, 10st. 10lbs. 2. *Black Velvet*, 11st. 1lb. 3. One mile and a quarter. 2 min. 59 sec.

7. THE STAND PLATE. Three started.

Claymore, 11st. 10lbs. 1. *The Nob*, 11st. 0lb. 2. *Newstead*, 11st. 10lbs. 3. From the two mile post, once round and in. 2 min. 14. 2. 5 sec.

8. THE TOWN PLATE

Bay Rum, 11st. 5lbs. 1. *Suavita*, 11st. 1lb. 2. *Fiasco*, 10st. 12lbs. 3. One mile and a half. 3 min. 35 sec.

Third day. March 2nd.

1. THE SUBSCRIPTION CHALLENGE CUP. Six started.

Fiasco, 10st. 12lbs. 1. *Spurs*, 11st. 1lb. 2. *The Doctor*, 11st. 1lb. 3. Two miles. 4 min. 46½ sec.

2. THE ST LEGER CUP. Six started.

Black Satin, 10st. 8lbs. 1. *Spuray*, 10st. 12lbs. 2. *Scud*, 10st. 10lbs. 3. One mile. 2 min. 15 sec.

3. THE HANDICAP PLATE. Two started.

Claymore, 12st. 0lb. 1. *The Nob*, 10st. 7lbs. 2. One mile and a quarter.

4. THE LADIES' PURSE. Eleven started.

Ariel, 10st. 8lbs. 1. *Patience*, Catch 2. *Sambroco*, 10st. 11lbs. 3. Once round. Two min. 3 sec.

5. THE KEECHONG CUP. Four started.

Egmont, 11st. 1lb. 1. *Suavita*, 11st. 1lb. 2. *Cassacou*, 11st. 4lbs. 3. *Fiasco*, 10st. 12lbs. 4. Twice round and in. 5 min. 36½ sec.

6. THE VICTORIA PLATE.

Warlock, 11st. 2lbs. 1. *Newstead*, 11st. 0lb. 2. *The Babe*, 10st. 7lbs. 3. One mile.

7. THE CONSOLATION STAKES. Twelve started.

Spurs, 1. Sunbeam, 2. Spray, 3.

Catch weights. Once round. 1 min. 59 sec.

8. THE CHAMPION STAKES. Five started.

Scylla, 10st. 12lbs. Temptation, 11st. 11lb. Bay Rum, 10st. 11lb.

One mile and a half. 3 min. 30½ sec.

Fourth day. March 3rd.

1. THE SCYLLA CUP. Four started.

Spray, 11st. 2lbs. 1. Scul, 10st. 13lbs. 2. Bravo 10st. 12lbs. 3. Presto, 10st. 12lbs. 0.

One mile. Two min. 22½ sec.

2. THE VISITORS' CUP. Five started.

Black Velvet, 11st. 4lbs. 1. Devon, 11st. 2. Paunce, 11st. 3.

One mile. 2 min. 27½ sec.

3. THE TEMPTATION CUP. Five started.

Jambaree, 10st. 9lbs. 1. Casseco, 10st. 4lbs. 2. Sunbeam, 10st. 9lbs. 3.

Mile and a half. 3 min. 44 sec.

4. THE WHITE VELVET CUP. Three started.

White Lily, 11st. 7lbs. 1. Cockshuf, 10st. 10lbs. 2. Quicksilver, 11st. 3.

Mile and a half. 3 min. 53 sec.

5. A NATIVE SCRAMBLE. WINNERS ONLY. Five started.

Scylla, 1. Temptation, 2. Allendale, 3

Catch weights. Once round.

6. A NATIVE SCRAMBLE. BEATEN PONIES. Seven started.

Scul, 1. Spray, 2. Beauty, 3.

Catch weights. Once round.

DULCISSIMA! DILECTISSIMA!

A PASSAGE IN THE LIFE OF AN ANTIQUARY.

(From Macmillan's Magazine.)

"Come, my dears," said I, looking in upon the room where my children were engaged in their various avocations; "come and see what a very interesting acquisition I have got to my collection of antiquities. It is the remains of a little Roman girl just discovered close to the place where the foundations of the Roman villa were turned up last summer; and it seems very probable that this little girl was a daughter of the house. Here is the glass jar—a more elegant and beautiful one than I have ever before seen used for the purpose—which contains her ashes; here is the lamp to light her on her last dark journey; here are the little ornaments she used to wear—mark especially this exquisitely enamelled fibula; here are her little shoes all quaintly studded with brass nails."

"O what funny shoes!" exclaimed one; "there must have been very bad roads in those days, when even little girls wore shoes studded with nails like that."

"On the contrary," said I, "the Romans were the first road-makers in the world; but never mind that now, here is the stone tablet which records her history, and a very interesting one it is."

D M

LVC. METELLAE

FILIOI. DVLCISS. DILECTISS.

VIX. ANN. VI.

"The letters D M at the top stand for *Dis Manibus*, something like," said I, with a free translation suited to family comprehension, "our 'Sacred to the Memory of.' The inscription then reads thus: 'Sacred to the memory of Lucia Metella, a little daughter most sweet, most tenderly beloved. She lived six years.' Observe that the Romans always, as Dr. Bruce remarks, avoided the mention of death; they tell us how long a person lived, never when he died. But is it not interesting," I went on, "to find more than a thousand years ago, and among a stern and warlike people like the Romans, these little touches of family tenderness and love?"

"O how very interesting! What a charming acquisition! How excited Dr. Harris (Dr. Harris was the antiquary of the district next in repute to myself) will be when he sees it!" were the various parting remarks made by my auditors, as they scampered back to their ordinary employments.

All but one. My Lily, my youngest, the apple of my eye, still stood, her fair head resting on her slender arms, gazing in silence, her lips slightly parted, a tear trembling in each soft blue eye, upon the relics of the little Roman girl. At last she spoke—

"Papa," she said, "this little girl was just the same age that I am."

"Yes, my darling," I said, "that is so; and moreover," I added, as a playful diversion to the child's gloom, "both your names began with L—another coincidence."

But the thought that was in the child's heart was too deep for playfulness. After a pause she spoke again in pleading tones—

"Dear papa," she said, "it seems so pitiful for this poor little girl to lie here among all these queer things."

"My darling," said I, "these queer things, as you call them, are Roman things, such as this little girl was accustomed to see around her every day during her lifetime. Indeed, many of them came from the villa of which it seems very probable that she was the daughter."

"But dear papa," she said, "You would not like me, when I am gone, to be laid out like a curiosity, and have strangers come and

examine the little things I used to be fond of, and remark what funny shoes I had."

"Well—but, my dear child," said I, "what would you do with her?"

"I would bury her," she said, with childish seriousness, "in the garden, beneath the weeping ash, where good old Cato and my dear little dicky and Willy's white rabbit are buried. And—and," she added, in a lower voice, "I would add upon the stone, if there is room, 'Suffer little children to come unto me.'"

"My darling," I said, "I think all that would be a little incongruous; but I'll tell you what we might do," I went on, as a device occurred to me, which I thought might soothe the feelings of the child, "you shall gather from time to time fresh flowers to lay upon her as she lies, and then, if her poor little spirit can look down upon this world, she will see that, though a thousand years have passed, one dear little English girl still watches over her with tenderness and love."

"O yes," she said, brightening at the idea, "I think she would like that. I will gather fresh snowdrops for her now, and then when summer comes again I will change them for violets."

"When summer comes again!" A sudden pang of foreboding shot through my heart as the dear child spoke. She too was most sweet—she too was most tenderly beloved. But we were not without our fears on her account, and anxious whispers had passed between my wife and myself respecting her. But I cast aside the fears, as presently she returned, eager in her little work of love, with the snowdrops she had gathered, and, sitting down by my side as I was engaged in making out the maker's name upon the vase, she wove them with deft fingers into a pretty wreath, which done, she reverently laid it in its place, and hand-in-hand we left the room together.

The next morning after breakfast I had a considerable amount of congenial work to do. In the first place there was a full and detailed account of these interesting discoveries for the County Society of which I was President, then a more condensed report for the Society of Antiquaries, of which I was a Fellow, various questions of detail had to be examined and elucidated, and in the course of the morning an artist was to come up to take photographs of all these rare and beautiful objects. While I was thus engaged, my wife entered the room with a troubled countenance.

"I am very uneasy," she said, "about dear Lily; she talks in such a strange way about a little girl in white that appeared to her last night. Of course it's all imagination, but I am afraid it looks as if there was something not quite right with her."

"We must have it looked to immediately," I replied, gravely; "perhaps we ought to have had some better advice before. I will send off at once to London for Dr. S—, and as the distance is not great, we may have him with us this evening. In the meantime, will you send Lily to me, and let me hear what she has to say?"

"Now, my darling," I said, as Lily entered the room, "come and tell papa all about it."

She climbed upon my knee, threw her arms about my neck, and hiding her face against my breast, as is sometimes the wont of children when they have something grave to relate, she went on—

"I fell asleep, you know, papa dear, with my thoughts full of this poor little girl. I awoke in the night with a trouble, I could scarcely tell what, up in my mind. When I looked up, I saw standing by my bedside a little girl dressed all in white, and pale—oh! so pale. She held in her hand a wreath of snowdrops like the one that I had made, and looking at me with a mournful expression, but still very kindly, she stretched forth her hand as if to hand me back the wreath. When I looked again, she had disappeared."

I reasoned for some time with the child, trying to persuade her that what she fancied she had seen was only the result of her own excited imagination; but I could clearly see that though her deference to me prevented her from disputing anything I said, her belief in the reality of what she had seen remained unshaken. I saw how deeply she felt pained that the loved daughter of a thousand years ago should be treated so differently to our loved ones of to-day, and I resolved that, great as the sacrifice was, it should not stand in the way of the happiness, and perhaps the health, of my beloved child.

So at last I said to her, "Well now, my darling, just tell me what you think should be done, and what this little girl would like if she could tell us."

She burst into tears, flung her arms round my neck, and sobbed out—

"O! dear papa, I know you are so fond of it."

"My darling," I said, "all the antiquities in the world are as nothing—nothing compared to my dear little girl's peace of mind."

"O, dear papa," she said, through her tears, "how can I ever, ever love you enough!"

"My darling," said I, "I know you love me as I love you. But now, what is it you think this little girl would like?"

"I think that what she wants is to be laid in her grave in peace."

"And so it shall be," I replied; "and it shall be done at once."

So we dug a grave in the corner of the garden where all the departed pets of the family were laid, and had it carefully lined with flat stones like a miniature vault, and therein we two—the puzzled gardener looking on—reverently laid the young Roman girl, with all her little treasures disposed around her, filled in the earth, and set up the stone tablet at the head.

We had scarcely finished our task when a well-known form was seen stalking up the avenue, and Lily, touching my hand in a little tremor, whispered—

"O papa! Doctor Harris!"

Dr. Harris was the vice-president of the society of which I was president, an ardent antiquary, and in the main a very good fellow. But he was one of those men whose excessive vitality sometimes gives an appearance of roughness to their manner. I knew full well that the sensitive nature of my little girl made her rather shrink from his somewhat boisterous advances; and I had a pretty shrewd guess that poor Dr. Harris, glaring over the remains with his portentous spectacles, was in the mind's eye of the child when she made her appeal on Lucia's behalf. He was, moreover, a man utterly destitute of sentiment, and in fact the last person we should have liked to come upon us in our present employment. I advanced to meet him, intending to explain it to him privately. But as he approached, he hallooed out with all the force of his lungs—"Lucky dog! I've heard of your discovery. Everything comes to you. Why does not some little Roman girl fling herself into my arms?"

And as he spoke he stretched out his arms, either in indication of his readiness to receive such a visitor, or as a salutation to my little girl, who had sheltered herself behind me. I took him aside to explain to him the state of the case.

"The fact is," said I, "that my dear little girl, whose health you know is rather delicate, took it so much to heart, that for her sake I have buried all the relics again."

"I see," he said, "and when the fit's over you'll dig them up again."

"Not so," said I, for some of my little girl's earnestness had imparted itself to me; "she shall lie in her grave for me till God comes to judge the world."

"Well, but, I say," he went on, "suppose I come up some morning with a brand new doll, promise me you won't stand in the way of business."

"My dear friend," said I, "when you have a little girl like my Lily—I recommend you to take the preliminary steps," (the Doctor was a bachelor)—"you will get to know something of what such little minds are capable."

"Ah!" he said; "ah! Now let me in my turn give you a little bit of advice. In case a couple of doctors come up some morning to interview you, if they should try to lead the conversation to this subject, be on your guard, lest it should turn out to be a case of *de lunatico inquirendo*."

So saying, all in perfect good humour, "it was," as people said, "his way," he took his departure, leaving me for once not sorry to get rid of him.

By and by the photographer came up, and instead of the relics he was sent for to depict, we found him some work to do in the shape of sundry little groups of merry and happy children.

And towards evening the great physician from London made his appearance. He was one of those few men who, in addition to skill born of natural sagacity and vast experience, are indued with something of that subtle intuitiveness which is a gift not to be acquired. And moreover, he had that winning charm of manner which makes even the most sensitive of patients yield up their inmost secrets. He listened with much attention and interest to the story we had to tell him, and had a long interview with Lily by herself, before he came to us in the study where we were anxiously waiting for his opinion.

"Well!" he said, "there is no great harm done as yet, but your little girl will require great care—very great care." And he then went into various details, which it is not necessary here to recapitulate. Before taking his departure, however, he said—

"Just one word more. Let me tell you, my friend, you never did a wiser thing than when you yielded to your little girl's whim I don't like to call it, for it seems more of a sacred feeling—about the Roman girl. I know well what a sacrifice it must have been, but I frankly own to you that I would not have liked to be responsible for the case of this child—so sensitive as she seems to be to certain deep impressions—with such a burthen on her pure, unselfish little mind."

"I cannot tell you, doctor," said I, "how thankful I am to you for that opinion, for now, thus fortified, I can set down my foot on all cavillers and scoffers. But does there not seem to be something not easy to understand in all this?" I went on. "My little girl retired to rest so perfectly satisfied with what I proposed, that it is difficult to conceive how anything could have arisen out of her own inner consciousness to produce such a remarkable impression upon her mind."

"I think it may be accounted for on natural principles," he replied. "Your little girl's own idea was a genuine one. She felt pained that the remains of a beloved daughter should be exposed to the vulgar gaze like, to use her own words, 'a curiosity.' Your alternative proposal, intended for the purpose of soothing her mind and at the same time keeping your treasures, was, however well-intentioned, something of a sham. Her deference to you, and perhaps a specious show of sentiment in the proposal, reconciled her to it in the first instance. But in the stillness of the night her little mind, brooding over it, waking or sleeping, came at last to see it in its true light, and produced on her, unduly excited as she probably was, this remarkable impression. This seems to me a fair way of accounting for it, but nevertheless I would not say that there is no other. Much as I despise the opinions of those who would have us believe that the spirits of the loved departed come back to twitch our hair and to play tricks upon tables, I dare not say that between two loving and kindred spirits circumstances may not arise to create a mysterious bond of sympathy for which it is beyond our philosophy to account."

"Something of that sort," said I, "seems to have been the belief of the Romans, who held that the *manes*, or spirits of the departed attached themselves as guardian angels to kindred spirits yet on earth."

"Well, however it be," said he, rising to take his leave, "there is no doubt that the best cure for all such mental disturbances is a perfect state of bodily health. And I trust that with the return of warm summer weather, your dear little girl may regain all her wonted health and spirits."

"Amen!" said I. "Doctor, amen!"

Summer had come again. The golden sunlight shed a glory on our stately elms, and cast their flickering shadows on the grass; the birds—we all loved and cherished them—sang their blithe carols on every side; all nature around seemed awakened to new life and loveliness. Within, all was darkness and desolation; for the edict had gone forth that Lily was to die, and not to live.

I had prayed, as I had never prayed before, that God would spare me this one ewe lamb, but it was not to be. In spite of all that skill and tenderness could do, the disease had of late so rapidly gained ground, that now even love could no longer hope. She had seen, she told us, the little Roman girl once more, bright and glorious as an angel, with outstretched arms and loving smiles, waiting to welcome her; and too well we knew what that sign meant.

I stole to her bedside for the few minutes during which, in her now weak state, I was allowed to be with her. I found her propped with pillows so that she could get a view of the loved garden corner where, among the childish graves, the sunlight flecked with gold the grey memorial-stone of Lucia. Her fair hair, soft and glossy as floss-silk, hung round her in tangled waves, that told of the restlessness of weariness and pain. Her sweet face was drawn in by hard, cruel lines, till the blue eyes stood out unnaturally large and bright; her poor little wasted arms trembled as she stretched them out to me. The wan little face lighted up with smiles as I approached, and, taking her hand in mine, bent over her to listen to her accents, now scarcely above a whisper.

"Oh! dear papa!" she said, "how I have longed for your coming. It is of you I have been thinking all this morning. How good you have been to me always—always—and especially that one time when you gave me up Lucia. She will be the first to meet me, for she will run before the rest, and I will take her by the hand, and lead her up to dear Aunt Mary and grandmamma; and I will take her aside and tell her all, and she shall love you—Oh! how she shall love you! And then, oh, dearest—dearest papa!—when you—come—we—" The lips still moved with loving words, but the feeble voice was choked.

Yet three days more, and I stood again by her bedside—to kiss for the last time the dear lips that should never smile a welcome to me more—to press for the last time the little hand that should never twine itself in mine again. All trace of weariness and pain had passed away; she lay, her long silky lashes veiling her drooped eyes, as in the slumber of innocence and peace. And on her breast—laid by an unseen hand—was a cluster of summer violets.

They sleep together in God's acre—the loved ones of a thousand years apart. It was Lily's last request that the little Roman girl should rest by her side under the shadow of the text, "Suffer little children to come unto me."

O, Dulcissima! Dilectissima!

YOKOHAMA MARKET REPORT.

FRIDAY, MARCH 29th, 1878.

The gloomy news from Europe and the continued depressed state of native currency continue to keep markets generally dull, and the ingenuity of our reporters is much exercised in finding a sufficiency of different phrases to indicate that business is dull and that there are no transactions to report. Yet we cannot say that the markets are in an unhealthy state: there can be nothing doing at this season in silk and tea and no dollars are consequently forthcoming for the purchase of goods; but there is every evidence of elasticity in the trade and it would at once respond to any turn of political or financial affairs in its favour.

IMPORTS:—The speculative demand for cotton yarn still continues, and we have over 2,000 bales reported again as 'sold to arrive.' It is much to be feared that this business will turn out disastrously for the foreign merchant: no bargain money is obtained on the great majority, if on any, of these sales; they are all made for periods which will bring the whole of the goods here nearly together: the native merchants are perfectly capable of combining, when the goods arrive simultaneously, to refuse to take delivery at all:—as they have done before,—and then, in a glutted market, to obtain the stuff at their own prices. And the native Courts will give no redress.

We have ascertained that our views recently expressed respecting the reflux of currency from Kiushiu are correct, and that there really is a good demand in the interior, and if the value of the currency approached a little nearer to par, good and brisk *bond fide* business would be done. As it is, the scarcity of dollars among the natives, which must necessarily last until the new season opens in our produce markets, of course prevents any but sales to arrive, except of a trifling character. Prices for most goods show a slight decline, for particulars we refer to next page.

EXPORTS:—**SILK.** Our market is almost exhausted of silk of purchasable quality, and the very depressing character of political and commercial advices from Europe almost entirely stops business. To such an extent has this depression been felt since our last report, that we have to leave our quotations entirely unchanged, and they must be considered quite nominal. The French mail took away 371 bales, making the export for the season 20,364. Stocks from 1,000 to 1,500 native bales.

EXCHANGE:—In consequence of the very limited business doing at the period of the year in produce, transactions in private paper since our last issue have been of a trifling nature, without change in rates.

For six months' sight Bank drafts, the demand at 3/11½ has been moderate, but an advance of an eighth offered this afternoon may induce further business for the English mail leaving 2nd proxo.

In local exchanges business has been inconsiderable at former figures, one New York and San Francisco there is no business to report.

We quote:—London Bank, 6 months' sight 4s. 0d. sight 3s. 11d., Credits 6 months' sight 4s. 0½d. Documents, 6 months' sight 4s. 0½d. Documents continental, 4s. 0½d. Paris Bank, 6 months' sight 4.90 sight 5.00. Documents, 6 months' sight 5.05. Shanghai Bank Bills, sight 1½d. Private, 10 days' sight 1½. Hongkong Bank Bills, sight 73½ o/o disct. Private, 10 days' sight 72½ o/o disct. San Francisco Bank sight 94½ nom. New York Bank, sight 94 nom. BULLION. Gold Yen 391, Kinsatsu 411.

[**LATEST INTELLIGENCE:**—Saturday 30th March. Noon. As we go to press we hear that the Japanese Government have received information from their ambassador at St. Petersburg, that the declaration of War is on the point of being made. Private telegrams received by foreign Banks report great excitement and the position 'most critical.')

SHIPPING INTELLIGENCE.—Inwards.

THE JAPAN TIMES

A WEEKLY REVIEW OF
JAPANESE COMMERCE, POLITICS, LITERATURE, AND ART.

NEW SERIES. VOL. 1. NO. 14.]

April 6, 1878.

[\$24 PER ANNUM.]

THE DRAIN OF BULLION.

IT has often occurred to us that the difficulties which the Japanese mind appears to experience in digesting the principles of Plutonomy as they are applied to commerce, and now universally acknowledged by western nations, may arise from the fact that the whole of the foreign trade is conducted by aliens; while the domestic trade is rigidly confined to natives of the soil. The antagonism thus naturally created between two classes, which in other countries merge together, has doubtless given rise to the popular conception of a foreign merchant as being a sort of rapacious adventurer, who, having by the help of his fleets and armies gained admission to the country, has succeeded in introducing a vitiated taste for his trumpery wares, in return for which he will accept nothing but coin. Indeed, if we may accept the leading articles of many of even the best of the native journals as reflecting the opinion of the masses, the unappreciated, misunderstood foreign merchant must be regarded by the people among whom his unhappy lot is cast with the same disgust and aversion with which the West Indian thinks of the vampire bat, which battens on the life blood of which it depletes its victim, while with its fatal, insidious caress it lulls him to repose. And while an honest foreign historian has to confess that—in the early days of our trade with Japan—too much ground of justification was given for such a comparison, he has to labour under another disadvantage. For of the influence of foreign commerce upon the wealth, industry and civilization of a country, the Japanese can of necessity have had as yet little or no experience, and without that experience, it is but natural that they should feel that what foreigners advance upon the subject is too strongly tinged by self-interest to be worthy of serious consideration. This is most lamentable: for Credit is the life of Commerce, and credit must be born of mutual confidence and common advantage, and until this fundamental truth can be driven into the mind of the native merchant, the labour of the publicist is spent in vain. But still, like the sower in the parable, he must go on, sowing the good seed. Though much falls on stony places and by the way-side, where it fails to germinate, yet some may fall on good ground, and the time may be yet to come when he who went out oppressed with doubt and discouragement, may return in joy, bringing his sheaves with him.

That the middle and lower classes of Japanese society possess the true mercantile spirit, there can be no doubt. The ambition of every domestic servant is to open a shop, or become a trader, as soon as he has saved a few *ries*; and foreign merchants are pestered with applications from aspirants who, for small wages, or for none at all, seek to enter their service with a view to availing themselves of the knowledge they thus hope to acquire. The first feature that strikes every traveller in the interior is the disproportion between the number of shops in the towns,

and the population which has apparently to furnish customers for them. If it be only a heap of unripe oranges, a few slices of odoriferous *daikon*, or a cent's worth of undesirable sweetmeats, house after house on either side of the street, offers its merchandise to the notice of the public. This national idiosyncrasy is possibly only another phase of a serious defect in the character of the middle and lower classes, which betrays itself also in an inordinate love for the *hibatchi*, and a predilection for such phrases as *mudaukashii* and *nochi-hodo*, but it also undoubtedly contains the germs of an enterprising spirit which, if properly educated, may at no distant date make Japan one of the wealthiest countries in existence. But before this useful disposition of her people can be profitably turned to account, it is necessary that Japan should give her adherence to those great principles which have long since been adopted by the leading commercial countries of the world. She must admit with them, that foreign commerce is of absolute necessity to her wealth and progress, and that in proportion to the encouragement given to foreign trade (or rather to the absence of interference with it) will be the position she is destined to occupy amongst civilized nations. Her merchants, her journalists, her statesmen must study, till they assimilate them, the leading principles of the Science of Wealth; must learn that money is not wealth, but only its representative; that a drain of gold from a country is less to be dreaded than a drain of food, or emigration of labour; that the readiest measure of a country's riches and vitality is the amount of its imports, &c. &c. Japan's foreign trade will never flourish, to the advantage of native and foreigner alike, until these and other elementary truths of Plutonomy sink deep into the national mind, and in setting forth what to our own countrymen are platitudes, we must be forgiven—and shall deserve to be thanked—if we can get our doctrines translated and adopted by the native press.

That the value of the imports into any country is the true test of the extent of its foreign trade, and consequently of its wealth, has been abundantly demonstrated. In the primitive community, he who was most expert and worked the hardest, was able to barter his surplus produce for other articles which were of more value to him, and consequently experienced the most enjoyment. Although the man who made two blades of grass to grow where only one grew, before is dignified with the title of a benefactor to the human race, self-interest alone prompted him to the exertion. If he had previously found one blade of grass sufficient for his own wants in this direction, it was manifestly waste of labour, and consequent shortening of his life, to grow the other one. But when he discovered that he could procure some other commodity, a pair of breeches for example, at less labour to himself by growing the extra blade of grass, than if he had set work to make them, he laid the foundation of that splendid edifice which, under the name of Commerce, has since astonished and delighted

the civilized world. Whilst buttoning the breeches, he would naturally remark 'Ha! my blade of grass has developed into a pair of breeches,' and the breeches-maker would rejoin—'Ho! my pair of breeches has produced a blade of grass.' The latter would have as much right to the title of a benefactor to the human race as the former, as without the stimulus of his breeches, the additional blade of grass would never have been raised. But neither farmer nor tailor would have assessed his labor at any other value than that of the article he received in exchange for it, as neither would think of spending his time in making breeches, or in raising grass, for which he had no purchaser. And although the progress of civilization and the exigencies of society have introduced a medium of exchange, a division of labour, and many other conveniences which now render the rude system of barter no longer necessary, a little reflection shows that the principle remains unchanged.

Every one therefore, whether he be a student of plutonomy or not, must admit that the test of wealth, as applied either to an individual or to a nation, is the *purchasing* power it confers. The mere possession of coin, *per se*, does not constitute riches, as poor Robinson Crusoe discovered when, with thousands of pieces of eight in his cave, he was forced to go about barefooted. In fact, were it possible to accumulate all the money of the universe into the hands of one man, in twelve hours' time he would be in danger of starvation, unless he had previously learnt some profession or trade, the produce of which he could exchange against necessary food. While on the other hand, his fellow-men would be merely put to the temporary inconvenience of supplying their wants by barter, until some other form of circulating medium was devised. To use the words of a well known writer on this subject:—"If gold and silver should at any time fall short in a country which has wherewithal to purchase them, there are more expedients for supplying their place than that of almost any other commodity. If the materials of manufacture are wanted, industry must stop. If provisions are wanted, the people must starve. But if money is wanted, barter will supply its place, though with a good deal of inconveniency." (Smith's Wealth of Nations.)

We have been led into making these remarks, for the triteness of which we have already apologised to our well-informed foreign readers, through noticing the uneasiness with which the increasing development of the Import trade is regarded by the native press (and we believe by the Government) as resulting in a considerable export of bullion, to the impoverishment of the country. As has been abundantly manifested by our translations from the native press, some of the leading journals of the capital, whose circulation must, we are informed, be reckoned by thousands, are almost demoniacally possessed by this error, and no one can confer a greater benefit on both native and foreign commerce than he who shall succeed in exorcising the evil spirit. That such fears are utterly groundless has been abundantly shown by every writer on Plutonomy for the past fifty years, and we could fill our present issue with quotations in proof of the assertion. McCulloch says "it would be worse than useless to take up the reader's time by proving what is now universally admitted—that gold and silver form only a very small portion of the wealth of every civilized country, and that it is in no respect necessary to take any extraordinary measures to force their importation, or to retain them at home after they have been imported." Not only is the common theory with respect to the balance of trade erroneous, but the very reverse of it is true. In the *first* place, the value of the commodities imported by all countries which carry on an advantageous commerce (and no other will be prosecuted for any considerable period) invariably exceeds the value of those which they export. Unless such were the case, there would plainly be no fund whence the merchants, and others engaged in foreign trade, could desire either a profit on their capital, or a return for their outlay and

"trouble. And, in the *second* place, whether the balance of debt be for or against a country, that balance will neither be paid nor received in bullion, unless bullion be at the time the commodity, by the exportation or importation of which the account may be most profitably settled."

Let the Japanese take this condensed into the axiom:—that the excess of imports over exports represents the profit on their export trade;—and when therefore they see a large export of bullion from the country, they may be assured that they are giving in exchange for their purchases that which it costs them least to give. If the course of trade, for instance, necessitates an export of some commodity to the value of \$1,000,000 to pay for imports, or for a loan &c., and it is possible to procure for \$900,000 a quantity of silk, the sale of which would realize \$1,000,000, silk is the most profitable form in which the payment can be made. If on the other hand, silk is of greater value in Japan than in the country to which the debt is due (making allowance of course for expenses of transit) and the quantity necessary to liquidate the obligation would cost \$1,100,000, Japan undoubtedly loses \$100,000 by exporting silk, and had better export bullion. The money shipment shows that the native grower or producer has found a more profitable market for his produce in Japan, and so far from its being a loss to the country, it is actually evidence that the foreigner is getting the worst of the bargain. To elucidate this point fully would occupy more space than we can at present devote to it, but we may mention one fact in illustration. Sterling exchange, or the value of drafts upon London, fluctuates in accordance with demand and supply, or in other words follows the universal law of commerce. When the quantity of produce exported greatly exceeds that of the goods imported, there is naturally more money required by the purchaser of produce than is available from the sale of goods; whilst if but little produce is being exported and many imports sold, a surplus of money comes into importers' hands. If no other disturbing causes obtain, in the former case exchange rises, in the latter case it falls. The foreigner therefore, who has imported goods at the time when exports have fallen short, finds himself obliged to remit at unfavorable rates, and his venture proves unprofitable, for no other reason than that the money which he has received in exchange for his wares is not worth so much to him as he expected.

It was our intention to have offered some remarks respecting the details of the trade of Japan during 1877, but our article has already exceeded its allotted space, and we doubt not that our mercantile readers will be well pleased with us for sparing them our speculations as to the causes of the increased consumption of cotton yarn, and our expression of surprise that so large a proportion of the imports sold in Yokohama should be for the Osaka market. If any of them have any special views upon these abstruse questions we shall be glad to see them ventilated in our Correspondence columns. This is, besides, an elementary chapter of our Primer of Plutonomy, and as such more fitly addressed to Japanese readers. We should be fully rewarded for our work if we could think that perusal of it would convince Government, Press, and people that they have no cause to fear either the export of bullion, or the import of foreign goods; that though both are indications that new wants have been created, both are also evidence that the gratification of these wants, and consequently the extension of the people's happiness, are paid for by increase in the value of the country's products, and development of her purchasing power.

H. M. S. "EURYDICE."

THE loss of H. M. S. *Eurydice*, with her crew of four hundred men, must have taken all England by surprise, as the vessel was well known to have abundant

stability, and good sea-going qualities. We fear that all on board at the time of the accident were drowned, and that the exact cause of the turn-over will for ever remain a mystery. The capsizing of H. M. S. *Captain* in 1870 was easily accounted for, after the fact; indeed Mr. Reed asserts that he prognosticated the loss before the vessel went to sea. The iron-clad was too heavily weighted, her coal stock had been exhausted, the centre of gravity was in consequence raised unduly, and the vessel, with her low freeboard and general instability, was not in a fit condition to support a heavy press of canvas in squally weather. The loss of H. M. S. *Eurydice* is not so easily accounted for. She had no engines or coal bunkers to derange her stability, her masting was, not excessive, and the only difference to her designed condition which occurs to us is, that her eighteen 32 cwt. guns were removed from the main deck, and that the only armament carried on her last cruise, was four 3½ ton (64 pounder) guns which were placed on the upper or spar deck. The removal of about 45 tons weight from the main deck would undoubtedly make a considerable difference to the little frigate when under sail, unless counteracted by compensatory ballasting. And if, as is possible, no compensations had been made for the changed weights, the loss of the vessel will be explained, under conditions of weather frequently occurring in the West Indies, and indicated in our note of last week, when first mentioning the catastrophe.

Our readers may be interested if we add a few remarks on vessels which, owing to the changed conditions of warfare, have become obsolete. The *Eurydice*, of 921 tons and 26 guns, was one of the most perfect sailing frigates ever built. She was designed by Admiral Hayes, to compete with H. M. S. *Vestal* and *Carysfort*, which were built on the draughts of Sir Wm. Symonds. The designs of Admiral Hayes were not entirely original, as he took for his model the immersed sections of the famous Spanish frigate *Santa Margarita*, a vessel of incomparable speed in her day, built in Havana over eighty years ago. Other nations, in those days, had paid more attention to ships' forms than ourselves and had certainly produced better models; and up to the year 1830, our best men-of-war were built upon the lines of captured vessels, such as the *Santa Margarita*, the *Hirondelle*, *Canopus*, *San Josef* and others. The modifications made by Admiral Hayes were, contrary to the usual course, not detrimental, and the *Eurydice*, from her first commission to the day she went down, was one of the fastest and best sailing vessels in Europe, and her speed when beating to windward was extraordinary. Her success on all points was so great, that Admiral Hayes was ordered to build a vessel 500 tons larger than the *Eurydice*; and he produced the *Inconstant*, of 1,400 tons and 36 guns, to compete with the *Castor* of Sir R. Seppings and the *Pique* and *Cambrian* of Sir W. Symonds. The *Inconstant* had the same form, immersed and emerged, as the *Eurydice*, and, like her, was by far the best vessel of her class; beautiful, swift, perfectly manageable, with good stowage and fighting quarters, and in all respects an admirable and even perfect cruiser. It is certain that no navy possessed more beautiful ships than the English navy had from 1838 to 1848: the French ships were too crowded with guns and, as a rule, were crank, and carried their main-deck batteries too low, and although the United States had some very heavy frigates, armed with Paixhan shell guns, their speed under canvas was, generally, inferior to that of the British frigates. When, at a later time, it became necessary to carry heavier shell guns, and in consequence to increase the size of the sailing vessels, no improvement was made in form or stability, speed or sea-going qualities; in these the vessels built between 1838 and 1848 were never surpassed, and to Admiral Hayes belongs the pre-eminence of merit. He did not live to design a larger class of vessels than his two famous ships; his drawing

for 50 gun frigates and two-deck ships of 80 or 90 guns being uncompleted when he died. The *Emerald* of 50 guns, laid down for a sailing frigate, but afterwards lengthened and converted into a screw steamer, was built on lines, always similar and in part identical with the *Eurydice* model, but was not a success, as her immersed body was not suited to carry the weights of engines and coals. But had Admiral Hayes lived, we believe he would have maintained his superiority in the experimental squadrons of 1848, 1849 and 1852, when the superb frigates of Edye (*Indefatigable*) Blake (*Phæbe*) Fincham (*Raleigh*) White (*Phaeton*) Lang (*Nankin*) and Symonds (*Arethusa* and *Constance*) competed for mastery. Of these magnificent vessels, the *Nankin* was the best of all, though the *Phaeton* was fastest in light winds, and the *Arethusa* had the advantage in heavy weather. The *Nankin* also had the superiority of emerged form and was unquestionably not only the most beautiful frigate of her own class, but also probably the most exquisitely shaped sailing vessel ever built in England. At this time, England possessed a noble fleet of sailing frigates, and the art of seamanship was brought to a perfection we shall never see again, as for want of practice, deterioration must occur. There is now no room for the talent of Keppel, Seymour, Elliot, and others of the old school, as the oblong, rectangular boxes of the present epoch are managed, when under canvas, with difficulty, and their progress depends mainly upon the stoker.

Many of the larger sailing frigates were lengthened and fitted with engines, but not successfully, as the midship sections were unsuitable. Then followed a series of fine vessels, specially designed for screw propulsion, mostly draughted by Mr. Isaac Watts, one of the best English naval architects, and the different types, *Imperieuse*, *Tribune*, *Faun*, *Pearl*, *Shannon*, *Doris*, *Mersey*, *Ariadne*, *Perseus*, &c. maintained his great reputation.

But few of our noble wooden sailing ships now survive even as hulks, and in a few years more, even these must disappear, and their fine models become obsolete relics of the past. In these waters we have had some good specimens of the old wooden fleet. The *Rodney*, designed by Sir R. Seppings, the *Conqueror*, by Sir W. Rule, and the *Princess Royal*, by Sir W. Symonds, were stately ships possessing fine qualities, and of perfect carpentry and construction. These three ships were originally designed as sailing vessels, but at the time of the Crimean war of 1854 were lengthened by the stern, and converted into screw steamers. As such, they did good service for a time, until large rifled guns made all high wooden-built ships dangerous, and noble and swift two and three-decked ships like the *Agamemnon*, *Duncan*, *Howe*, *Victoria*, the master pieces of Watts and Lang, and a score or more of others, were relegated to peaceful duties, and are now coal hulks or school ships. For war they are useless.

The cruising ship of the future will be like the Russian *General Admiral*, or the English *Shannon*, *Nelson* and *Northampton*; full rigged ships, essentially built of iron, with numerous "cloisons" or compartments, with armoured athwart-ships bulkheads, to keep the battery free from raking attack, and to cover the guns for fore and aft fire. The vertical sides of the batteries are wholly unarmoured, and the only protection to the men who serve the broad-side guns, will be a steel screen or traverse at each side and at rear of the gun. But the lower, or orlop, deck is armoured horizontally with three inches of plating, and the shell room, magazines, torpedo apparatus, engines, boilers and steering machines are protected by a vertical belt of armour 180 feet long, about 12 feet wide, and on the average 9 inches thick. The vessels are armed with strong spurs, and are either coppered, or sheathed with zinc, and as they carry 18 ton, (400 pounder) guns, for end-on fire and 12½ ton (300 pounder) guns for the broad-sides, will be, even against heavy iron-clads, fully effec-

tive antagonists. These iron ships will have good coal stowage and a speed of $14\frac{1}{2}$ knots, and are in all respects steam vessels, as the sails are hoisted, anchors raised, the guns trained and loaded, small boats propelled and steering effected by steam power. Even the cooking is done by steam, as no fire is allowed in the galleys, roasting, boiling, stewing, &c., being done by the heat of high pressure steam. What a difference between the new ships and the class just replaced, like the *Immortalité* or *Galatée*, with their ten or eleven knot speed, small battery of four 115 pounder and twenty-four 64 pounder guns, and on which all work except propulsion of the vessel was done by the strong arms of 500 sturdy seamen!

The new teak-sheathed iron frigates *Shah*, *Inconstant*, and the corvettes of the *Active*, *Rover*, and smaller classes will be useful for a time as cruisers, by reason of their speed and strong construction. But they cannot endure the fire of heavy shell guns, are ineffective against even thinly plated ships, and their coal stowage is too small. And even the *General Admiral*, *Nelson*, and *Northampton*, considered as cruisers, do not attain finality and must ere long become as obsolete as their discarded predecessors, if the powers of carbonic acid gas can be safely applied to a rotatory or disc engine, which can give direct and not transmitted motion to the shafting. The present style of marine engines has become intolerable, on account of the great space required for coal, the room taken up by cumbrous machinery, and their excessive complications of reciprocating parts, tubes, valves, &c. In fact, the sooner we can give up steam, the better. On account of the excessive loss by radiation, coal fuel does not do even one tenth of its proper (theoretical) duty, and we trust soon to have an efficient motor in a gas of great expansive power. We see that one of Mr. Reed's last iron-clads has cylinders of 127 inches, and wants over 260 tons of coal for twenty-four hours' full speed!

War has now become scientific and murderous, but though its conditions have changed from the times of our Nelsons, Hoods and Cochranes, we may still rely on their successors, the Hornbys, Hewetts, and Seymours, and the scores of other British leaders of men, to sustain the glorious traditions of the Empire at this anxious time, when the nation is again called upon to maintain the cause of the peoples against the assaults of autocracy.

THE FORESTRY LAWS.

WE gladly welcomed the issue by the Naimusho, last week, of the Forestry Notification, and as the main principles which we have been advocating so strongly have been so promptly and frankly accepted by the Government, we have little doubt that they will receive in good part the criticism to which we have now to subject their Regulations. Criticism is a necessary duty, for the Regulations are full of serious errors.

The most important, and primary, fault is the lack of any attempt to establish the distinctions which are absolutely necessary in any Imperial system of Forestry:—the division of woods into Government, Communal, and Private. In every country where disafforestation has been going on for any time, or where for any reason, afforestation is desirable, there are vast tracts of mountainous and waste land which only a Government can attempt to clothe with wood, and which it is quite out of the power of any private individual to utilize. Governments can borrow money at a rate of interest below that at which private speculators can obtain it, and therefore the cost of the capital required for such works is greatly increased to the latter; Governments—trustees for the peoples—may properly invest capital in public works which will give no direct money return, will give but a small return, or will give a return only after a long period of expenditure; but

private investment in such enterprises as these cannot be expected: and in many instances, what are known abroad as Government Forests come under one or other of these categories. For, besides the woods, in which are grown the timber required by the various naval or military departments for building ships, gun-carriages, transport wagons, &c., it is most proper that Governments should plant forests on mountain ridges, whence spring, from rain or melting snow, the sources of rivers; to protect the streams in their infancy, to husband and equalize their water supply, to prevent the destruction of their beds by landslips or crumbling rocks. Governments may fitly spend more money along the courses of the streams, in planting loose alluvial banks with alders, willows, or other trees which will bind and strengthen them, and so helping to confine the rivers within their beds, that they may not overflow and devastate the land. In course of time, as we pointed out last week in 'Rivers Rebuilt,' wise expenditure like this, aided by other necessary works, will improve the lower courses of the streams and open up from the sea freer channels for navigation. And thus land becomes more valuable, the commerce of towns grows, the productive and purchasing power of the whole country is increased and thus is made, for the direct expenditure, the indirect return. But no private individual can be expected to undertake works like these. Again—it may be the duty of a government to plant woods on sterile plains, on drained marshes, on reclaimed wastes bordering some 'ruined river;' with the view that, hereafter, when the forests have done their work of recreating the *humus*, or soil, they may, by some succeeding generation, be cleared again and converted into arable land. Or, woods may be planted simply to attract rain in a dry country, and so improve the climate. Or, again, there are what may be called medicinal plantations, the latest outcome of the Science of Forestry—plantations of trees whose subtle perfume drives away malarious fevers. But all these which we have enumerated, and others, are works of afforestation which cannot possibly be undertaken by private enterprise, which cannot live on indirect profits, and which is entitled to ask for a rapid, as well as a direct, re-imbursement of capital. Therefore they must be undertaken by Governments, must be paid for out of the public purse, and must only be required to make returns in the indirect methods which we have pointed out. It is a most grave omission in the Naimusho's Regulations, that no provision whatever is made for this part of the work of afforesting the waste places of Japan.

'Communal' woods form the next important division into which forests are separated, in countries where the science of forestry is understood and practised. These are woods on subordinate tracts of land adjunct to 'communes,' townships or districts, whereon timber is raised for the benefit and use, and at the expense of separate communities, acting under their local officers. These are mainly tended with a view to immediate and local utilization, supplying building materials for houses—or for ships, near a coast port—wood for various local manufactures; such as furniture, tubs, barrels, agricultural implements, carriages &c. according to the district, climate, or condition of soil which may best suit any particular class of wood. In the event of a village or town being devastated by fire, or in case of a typhoon, always a local atmospheric convulsion, destroying fishing boats or junks, if a communal reserve of timber were at hand to be indented on for the materials of reparation, how rapidly and cheaply might such damage be repaired. Surely forethought in this direction is worthy of the attention of a paternal government. And pre-eminently and continuously, where coal does not exist, a perennial provision of fuel would be secured. This is a most important use of communal forests, fuel being indispensable, bulky, and costly to transport; and

again the Japanese Government will find, on enquiry, that this necessity of the people is carefully provided for in well-governed countries. And here we must digress so far as to commend the action of the central Government in giving considerable latitude of authority to the *kencho*, or local governments, in the matter of granting of leases, &c. to private individuals. The time has not, apparently, arrived for entrusting provincial bureaus with the expenditure of the public funds;—and the example of China must necessarily make the Mikado's government excessively cautious in this respect—but with railways and telegraphs traversing the country and facilitating communication, we hope soon to see something like the healthy municipal system of England springing up in Japan; and then, among other useful ways of spending provincial funds, will be seen to be this, of tending communal forests. Until this happier consummation is reached, the more costly and tedious method will have to be used of supplying provincial treasuries with funds for this purpose, from the Capital.

We now arrive at the consideration of the management of the third division into which forests are divided—private woodlands; and here we have to find fault with the Government and its Notification, for excess of supervision and interference, as much as for neglect of the other two more important departments. For really, private forests, when Government and Communal forests are properly administered, may be successfully left very much to the care of private persons, who may be generally trusted to look after their own interests, and should only be controlled by Governments, when their pursuit of their private ends threatens to conflict with the public good. What private forestry especially requires, in a disafforested country, at the hands of Governments, is encouragement; and considering that the investment of capital in tree-planting and forest culture must always be large, while the returns, though ultimately certain and crescent, are always at first meagre, governmental encouragement should be very liberal; and we regret to say that in the Regulations under review, we do not find as much of this liberality as we should wish to see, while there is more than enough of interference and control. Not that we deprecate 'control,' which, as we have said, when writing on the subject before, is essentially necessary to counteract the stupid greed of the peasant. But the control should not be brought into play until the forest is planted: when this has been done, it should be regarded as a banker regards a fixed deposit of money, and treated as such: the depositor being controlled to his own advantage. But criticism of these faults in the document before us we are compelled to postpone until next week; for it is one of the disadvantages under which labour journals like the *Japan Times*, when treating of such important questions as this, that the work of the writer must be interrupted, and the attention of his readers suspended, in obedience to the mechanical exigencies of the press. Proper division of the heads of his lay sermons is, therefore, what the journalist has chiefly to aim at; and thus, having noted the errors of omission in the Forestry Regulations, we must be content to leave those of commission for examination next week.

MR. RUSSELL ROBERTSON.

THE English Mail of the 10th. inst. will take away from Society in Yokohama a prominent and familiar figure, for H. B. M. Consul goes home on long leave, after a lengthened term of service. Mr. Russell Brooke Robertson entered the service in 1860, and has had nothing to complain of with respect to the steady and rapid promotion to which his industry and ability have entitled him. After passing through the grades from Student-Interpreter to

First Assistant, he was fortunate in being at hand during the troublous times of 1868-69, during which he was Acting Vice-Consul at Osaka, and First Assistant at Hiogo. Early in 1879—after a few months' tenure of the acting appointment, he was made Vice-Consul at Yedo, and in the following year was promoted to the full Consular dignity, and appointed to this post, where he has since occupied the curule chair. Until relieved to a great extent of his judicial duties, by the establishment of a Branch of the Supreme Court, Mr. Robertson discharged them with that efficiency which is best guaranteed, in the case of an amateur judge, by his taking the clear light of common sense as his guide and avoiding the delusive leading of legal arguments, the fallacies and sophistry of which neither education nor experience have fitted his mind to detect. That he succeeded in satisfying, at least, the suitors who came before him, is best shown by the fact that his decisions were seldom challenged by appeal. Since he has been relieved of the heavier part of his judicial functions, he has ably performed the laborious duties of police magistrate and judge of the Small Cause Court. But it is on his Annual Reports on the trade of Yokohama and Japan generally that Mr. Robertson may chiefly rest his claim to the community's respect and thanks, and to his official chiefs' appreciation of him as an industrious, able and valuable public servant. These documents are useful and thoroughly reliable records; they evidence great care and no small amount of labour in their compilation, and appear to have served as models for the Consular Reports from the less important *emporia* of trade in Japan. Merchants in the East are generally familiar with the way in which, as a rule, Consular Reports are got up. A Consul has to ask for assistance from experts on particular subjects, in precisely the same way as an editor of the newspaper solicits contributions for his columns; and it is therefore in the 'editing,' so to speak, of the various monographs with which his commercial friends supply him, that he must show his own knowledge of the trade of the port. But this 'editing' may be very badly, or very well done. A Consul totally ignorant of business matters, or to whom the subject is distasteful, may manufacture a Report by getting a number of specialists to write for him sections of the document; but if, as not unfrequently occurs, his contributors overstep their special provinces, and walk into those of their neighbours, he may publish most ludicrously contradictory views of the prospects of the same article of Import or Export; as we have, not unfrequently, seen done. At the best, his paper will very much resemble that of the sub-editor of the *Estatesville Gazette* on Chinese metaphysics, after he had crammed for twenty-four hours from the *Encyclopaedia Britannica*,—reading for China under the letter C, and for Metaphysics under M, and then combining his information. Mr. Robertson's Reports are of a different character: they show signs of careful editing, and also that he has possessed sufficient knowledge of his own of the trade, to prevent any of his contributors from making use of his official Report for the ventilation of their own private views: a vice of other than Consular Reports, and notably of those published by Chambers of Commerce. His statistics, too, have always been ample in their range and satisfactory in point of accuracy. But it is to his own monographs, on special subjects, that Mr. Robertson's annual reports have owed their chief value. Whether the insertion of these extremely interesting chapters into the rather dry and monotonous yearly Blue-books is due to an order from the Foreign Office, or to a suggestion from H.B.M. Minister, we are not aware,—but we think the idea came from Downing St. Be this as it may, their interest is undeniable, and Mr. Robertson's have been among the best of their class. Passing over his first in the 1870 Report, on Currency, which we should certainly be surprised to hear was written by himself, and that on the

Lighthouse Department, in 1871, acknowledged to have been received from Mr. Brunton; we find him giving us, in 1873, a most admirable series of monographs, on Silk, Silkworm-egg cards, Tea, Tobacco, Wax, Hemp and Rice;—all crowded into one year's Report, but which, properly husbanded, would have floated as many successive Reports as he treated subjects. For, in the preparation of these, he consulted a variety of Japanese authorities, living and dead, and the results of his labours were a complete series of papers, which left very little more to be said upon the subjects of which he treated, and which ought to be transferred to the pages of some such standard work of reference as a Cyclopædia, instead of being interred in the pages of Blue books. And by no means the least interesting were the paragraphs with which he closed his Report, of the year mentioned, in which he more rapidly sketched the effect upon foreign intercourse and trade, upon the purchasing power of money upon wages, and upon the social economy of the people of the district with whom we were brought in contact. As a whole, this Report for 1873 is a perfect mine of information, and if Mr. Robertson had done no more, he might fairly rest upon it a claim to a high place among the authors who have written on Japan. But in 1874, he gave us an equally interesting paper on the growth of the lacquer varnish tree, the *urushi*, whose fruit produces vegetable wax, and its congeners, the *yama urushi* and the *tsuta urushi*; on the preparation of their sap into varnish and on the subsequent manufacture of the lacquer ware for which the country is so famous. Peripatetic pilgrims of pleasure who visit our ports in their scamper round the globe, and who spend so much money in the curio-shops, to get so small a return, would spare their purses and improve their collections by preliminary perusal of this paper before perfecting their purchases. In 1875 he took Mushrooms, Sugar and Cotton as his texts, and in 1876, having no more worlds to conquer on the main land, contented himself with writing an exhaustive review of the year's general trade. But he contributed to the Asiatic Society's library a monograph upon the Bonin Islands, which he had to visit officially in the spring of the year, and so literally exhausted the subject, that he left nothing to be said by a steamer-full of *savans* who paid another visit to them a few weeks ago. The liberal policy of the British Minister has given these Reports to the people most interested in them,—the mercantile communities of Japan—immediately after their transmission to him, instead of sending them only to the Foreign office, to return to us, some eighteen months too late, in the shape of Blue books, and we have therefore, another Report to receive, almost immediately, from Mr. Robertson's pen,—that on the Trade of 1877.

The leading columns of a publication like this Review should be only exceptionally used for personal sketches such as this. We are not of those who admire the *World's* 'Celebrities at Home,' which appear to us to be the very flower of rank vulgarity. A literary friend of ours, who used to write obituary notices for the *Illustrated News*, was induced to divert his talents into other channels, by the remonstrance that his *epitaphia* 'added a new terror to Death;' and if every prominent resident, as his departure from the port approached, had to dread a valedictory article in a weekly paper, the 'homeward smile' would fade from his face and the joys of his holiday be much curtailed. But it appears to us by no means unfitting that the *Japan Times*, which dedicates so much of its space to the discussion of purely commercial subjects, should take the opportunity of acknowledging the obligations under which commerce is laid by any author, and the accident of his holding an official position need act as no deterrent. Mr. Robertson, with singular good taste, has deprecated the expression of his friends' goodwill being manifested to him in a concrete form; but his

published Annual Reports of Trade are public property, and he may not complain at having to suffer one of the 'Calamities of Authors' in having his works reviewed. We will conclude by wishing him a pleasant vacation, and by tendering the hint that if he would employ some of his leisure hours in collecting and expanding his Notes on the Trade of Japan, so that we might have them in a more easily accessible form than they exist at present, he would confer a benefit on commerce and establish on a more permanent basis his reputation as an authority on Japan trade.

EDITORIAL NOTES.

IN the *Choya Shimbun*, last week, appeared an article supporting our arguments against disafforestation, and urging the Government to take our advice respecting the establishment of Forestry regulations:—the writer, in a postscript to his article, congratulating the country upon the fact—which he had heard while writing—that his recommendation had already been carried into effect. He gives us a few additional authorities and facts worth putting on record. Quoting Mencius, who wrote 'Axes must enter the forests only in limited times,' he rightly attributes to that sage, foreknowledge of the evils to come from disafforestation; and he also gives us the following forcible extract from a Japanese work by one Kumasawa Riyokai, respecting the calamities resulting from forest clearances:—

"The fact that there is lately a diminution in the evening showers on the west side of Harima is caused by the trees having been cut down. And when there is a refreshing shower occasionally in the summer evenings, if we watch the place where the cloud comes from, it is always from the thickly forested summits of the mountains in Awajishima."

The writer goes on to tell us that, when the Government commuted the pensions of the *Shizoku*, they gave away to them large grants of Government forest lands, rich in fine old timber, which has since been cut down for sale, without any discrimination or any attempt to replace what has been taken away; and he very properly urges that this ought to be stopped, and the thinning of woods, even private property, only permitted under proper inspection. Adducing the example of the China famine, as used by ourselves as a warning to this nation, and referring also to the effects upon rivers and riparian country, detailed in our essays, he sums up the evils of disafforestation under the following five heads. 1o., he says, good timber will gradually become scarce, and Japan will have to import from foreign countries house and ship-building materials; 2o., there will be less morning and evening showers of rain, (we fancy he means dew); 3o., the land will become dry, and the sources of rivers get empty; 4o., mud and sand will float down the rivers, and so choke their beds; and 5o., a valuable means of purifying the air will be lost, and the general temperature of the climate will be raised.

IT is very gratifying to see intelligent native journalists thus assisting foreign efforts to benefit Japan. A single article in such a paper as the *Choya Shimbun* has infinitely more effect than a dozen in our own columns. It has been a source of great regret to us that the native Government should have resisted the establishment of native papers conducted by foreigners, and that our own Minister should have endorsed their action. We can fully appreciate the motives which influenced both at the time; when the native press had recently so misbehaved itself as to have required repression, and when the Government's position as regards the whole population was more precarious than at present. But the evil that foreign-conducted native journals might, even then, have wrought, would have been overbalanced by the good they would have done; and foreign libel laws would have been amply sufficient restraint, particularly on Englishmen, living under an Order in Council and virtually unprotected by juries; and we think the arbitrary exercise of power then displayed was uncalled-for and harmful. Now, that the Government has been so confirmed in its seat by the suppression of the South-Western rebellion, that it is fully as stable as

that of almost any European State, surely some relaxation of the press-laws and particularly the abrogation of the regulation forbidding foreigners to contribute to the native journals, might be fitly and wisely permitted. The faster the native press grows, and the greater hold it acquires over the minds of the people, the greater becomes the need that it should be properly conducted. It is lamentable to note what false ideas on foreign commerce, especially, are being instilled, day by day, into their readers' minds, by the ill-informed and half-educated—frequently bigoted writers in the leading papers of the capital. For instance, hardly one of them can free his mind from the heresies that an import trade impoverishes a country, and that the precious metals are gauges of a nation's wealth. Who is to disabuse the people of these errors, so long as foreigners are debarred from writing in the native papers? The Government may—in all probability do—fear the inculcation of more liberal notions respecting politics than would be compatible with the security of the existing Venetian system. But the rulers of Japan should reflect that the forces which they dread, acquire strength very rapidly when repressed, and it would be far safer for them to permit their free expression. All foreign writers are not Radicals or Revolutionists, with a people's Charter, vote by Ballot, Triennial Parliaments, paid representatives, and Universal Suffrage as their *panacea* for all human ills. There are plenty of men who have studied history to better purpose; who would encourage the freedom of the Press, but restrain it from license, by precept and example; who lament the late extensions of franchise in England as dangerous errors, and foresee that universal suffrage must make shipwreck of the great American Republic; and who hate vote by Ballot as a means of demoralizing a people,—as an invention of the devil to tempt poor, honest men to fraud; and if the press in Japan were free, and foreigners allowed to contribute to it, we are sure that the country would greatly benefit, while Government men and Government measures would find no lack of competent foreign defenders when unjustly attacked. But we are exceeding the limits and extending the province of the 'editorial note,' and must change the subject.

FROM politics to earthquakes is not much of a transition. We intended to have published to day a translation of a list of the works consulted by Dr. Naumann during the preparation of his paper on earthquakes, part of which we printed last week, but unfortunately certain mechanical difficulties have occurred, which compel us to defer printing it until next week. This list is accompanied by notes explaining the contents of each work, and in some cases the period and locality with which it deals. These notes will be found of great use for future students, as the titles of Japanese books not unfrequently give no hint, or but a very vague one, as to their contents. It is with much regret that we find ourselves unable to publish the whole of Dr. Naumann's elaborate and scientific paper; but our readers can gather from this list of books what pains he has taken to collect and collate all the authorities obtainable on the subject. The part which we are compelled to omit consists of translations from these works—and gives a complete chronological list of all the earthquakes that have ever been noted in Japan by native observers: so that those whom the subject interests sufficiently, have only to get these books and translate them for themselves, to have their curiosity most amply satisfied. With the exception of manuscript works (which are very numerous among the Japanese) Dr. Naumann's may probably be regarded as a fairly complete catalogue of the native literature on volcanoes and earthquakes.

That it is no easy task to get together such a mass of literature on the subject may be gathered from the list of books used by Mr. Hattori, which is added to the interesting paper on the "Destructive Earthquakes of Japan," lately read before the English Asiatic Society. Nearly half the books named on this list are historical works, of general literature, which contain references to certain earthquakes; some few are also ordinary chronologies which are absolutely necessary, in order to render dates from the Japanese into the European Calendar; only the remainder, amounting to some thirteen or fourteen, can be properly included in a list purporting to give Japanese Earthquake literature. All the books in Dr. Naumann's list, with the

exception of the last three, which he calls "Auxiliary books," belong to that category.

We should be sorry, however, to be understood to criticize Mr. Hattori's paper in a carping or unfriendly spirit. We think that papers from native scholars, more especially when they are as valuable as his, should receive the heartiest welcome. We merely desire to point out a very striking difference between the two papers; a difference which would hardly be anticipated, and which certainly cannot deduct from the interest of Mr. Hattori's paper, although it speaks volumes for Dr. Naumann's energy and perseverance. Perhaps it is hardly fair to expect, in the volatile Japanese, the solid qualities of German philosophers.

WHEN writing, in other columns, on the Import Trade and the Drain of Bullion, our attention was chiefly directed to the latter subject. But the import of foreign goods seems to be as great a bugbear to the Japanese press; and we therefore recommend to the notice of those of our native friends who are alarmed at the growing taste of their countrymen for articles of foreign luxury, disclosed by a close examination of the trade returns, the following extract from Paley's Moral Philosophy:—

"It signifies nothing as to the main purposes of trade, how superfluous the articles which it furnish are—whether the want of them be real or imaginary—whether it be founded in nature, or in opinion, in fashion, habit or emulation; it is enough that they be actually desired and sought after. Flourishing cities are raised and supported by trading in tobacco; populous towns subsist by the manufactory of ribands. A watch may be a very unnecessary appendage to the dress of a peasant, yet if the peasant will till the ground in order to obtain a watch, the true design of trade is answered; and the watchmaker, while he polishes the case, or files the wheel of his machine, is contributing to the production of corn as effectually, though not so directly, as if he handled the spade or held the plough. Tobacco is an acknowledged superfluity, and affords a remarkable instance of the caprice of human appetite, yet if the fisherman will ply his net, or the mariner fetch rice from foreign countries, in order to procure to himself this indulgence, the market is supplied with two important articles of provision, by the instrumentality of a merchandise which has no other apparent use than the gratification of a vitiated palate."

M. CONIL Agent of the *Messageries Maritimes* S.S. Company, has been good enough to furnish us with a copy of the letter, (of which we give a translation) addressed to Captain Gulland of the *Glenartney*, on her arrival in Yokohama harbour; and of Captain Gulland's reply. The letter runs thus:—

Yokohama, 30th March, 1878.

To Captain Gulland,

the Officers, and crew of the *Glenartney*, Yokohama.

"GENTLEMEN:—The undersigned, members of the community of Yokohama, constitute it an honour as they deem it a duty, to testify to you their feeling of sincere gratitude for your noble and generous conduct towards the shipwrecked people of the *Meikong*, of the *Messageries Maritimes* Company, on the occasion of the loss of that vessel in the neighbourhood of Cape Guardafui.

"They are pleased that your arrival in Japan gives them the opportunity of becoming the exponents of the public gratitude; and, in now offering you their thanks and congratulations, they desire to assure you that the colony of Yokohama, which had many of its members among the passengers you succoured with such devotion and kindness, will always bear the *Glenartney* and the succour afforded by your aid, in constant and affectionate remembrance.

H. PIERRET. Consul du France.
A. Conil. Agent ppal des M. M.
H. de Girard Cap'ne du *Tigre*
A. Rolland Cap'ne du *Volga*.
&c., &c., &c.

This letter was signed by M. Pierret the French Consul, Mr. Conil, the officers of the *M. M. Tigre and Volga*, the other Foreign Consuls and all the principal firms and leading

citizens of Yokohama. Captain Gulland made the following modest and suitable reply:—

Glenartney S. S.

Yokohama, April 3rd, 1878.

A. CONIL Esq.,

Principal Agent of the
Messageries Maritimes.

"DEAR SIR:—I beg to thank you and the community of Yokohama for the address presented by you on the 1st instant to myself, officers and crew, and I can assure you that we all thoroughly appreciate your kindness.

"In rescuing the crew and passengers of the *Meikong* we only performed a duty which one man owes to another; and it gives us pleasure to think we have been the means of rendering assistance to our fellow creatures in time of trouble.

"I feel confident, that had we been placed in similar circumstances to the wrecked vessel, we should have received the same generous assistance and kindness from others."

I am Sir,

Your obedient Servant,

(Sd.) W. A. GULLAND.

WE ARE again compelled to hold over the publication of No. 11. of our Law Reports: there is not yet sufficient matter to make up a number. On Wednesday, April 3rd. judgment was at last given in 'The Great Road Case,' as *Punch* calls it. The defendant pointed out that, as fifteen out of the sixteen questions had been answered by the jury in his favour, he thought this was sufficient in itself to secure judgment for him; especially as the portion of ground which the jury found did not belong to the original lot No. 95 was not the same piece as that claimed by the plaintiff Government. The plaintiff's counsel admitted that he could not obtain a judgment for the whole of his claim but contended that though he could not get a great road, there was still enough to make a little way towards it. In fact, though he had asked for an ell, he didn't mind taking an inch. He asked for judgment in favour of the plaintiffs for that part found by the jury to have been annexed to the lot since the first lease of it was made. The authorities cited by his Honour, in his charge to the jury, were—he argued—inapplicable to the present case: 1° because the equities which restrict the conveyances of property, as between individuals, do not bind the Crown; and 2° that these decisions were given in cases in which the transfer of freehold estates was in question:—that in Yokohama, land was leasehold, and as between the Government and the foreigner, the law of Landlord and Tenant must apply.

His Honour gave judgment for the defendants on the finding of the jury. He declined to deal with the question whether the lot was freehold or leasehold, as that was unnecessary to the decision of the present case.

The fact is, that the Supreme Court, in China and Japan, has always regarded the holdings in the settlements, here and in China, as leasehold property; and though the question has not been free from doubt, the Court has treated land as personal property for the purpose of attaching probate duty thereto. Now, fresh doubt seems to be thrown upon the question; and we cannot look for a final settlement of the matter until the executors of some departed land-holder come into collision with the heir, as to their respective rights. It remains for each and all of us to pray that it will not be our own particular 'hopeful' whom we shall leave—for his fellowmen's good—'heir to a chancery suit, and messuages and lands,' the value of which become, year by year, 'small by degrees, and beautifully less.'

REFERRING to our remarks last week upon the changes likely to be made in charges for international telegraph messages, we have to record the following Notification from the Kobusho (Public Works Department.)

NOTIFICATION No. 7.

(4th day, 4th month, 11th year of Meiji.)

"It is hereby notified that the existing rate of charges for International telegrams will be abandoned on and after the 1st day of the 5th month. (May 1st.) and that a charge of 20 cents (Mexican) per word for such

"messages, forwarded from or destined to any place what-ever in the Empire, will be adopted from the same date."

This refers of course to the charge for use of the Japanese lines, over and above that for use of the foreign wires; though the fact is not clearly stated. Twenty cents is a higher charge than we expected, and, it appears to us, higher than necessary: ten or twelve would have been fairer.

WE HAVE to acknowledge with thanks, the favour granted to us by the *Japan Gazette*, of allowing us to extract from its columns the useful Monthly Trade Reports made up from the Customs' official returns, which we publish to-day. We have slightly re-modelled them, to suit our own columns, but the *Gazette* must be credited with the laborious compilation. This fresh proof of the activity and public spirit of its enterprising proprietors will, we trust, be properly appreciated by the mercantile community.

We put this table, this week, in place of our usual Market Report and quotations of prices. When, week after week, the only difficulty in writing on the trade of the place is to find new synonyms for 'dull' and 'depressed,' 'no sales' and 'nominal,' omission of remark at all comes with a certain smack of novelty. In Exchange, there was more than an average business done on Hongkong, a lac and a half having changed hands between the Banks at 1½ to 2 per cent discount, but this is the only transaction of the week which deserves report.

A LETTER from the Dutch Engineers employed by the Japanese Government on the works for the improvement of the Osaka river, objecting to our criticism of their labours, has reached us, unfortunately too late for publication in the current number of this Review. It will receive prominent publication next week.

THE *Hongkong Daily Press* of the 25th ulto. contains the following detailed notice of tree-planting going on there, which we are sure will be read here at present with interest:—

"We understand that, under the auspices of His Excellency the Governor, who has taken an active personal interest in the matter, the work of preparation of tree nurseries for future plantations on the hillsides of the island and Kowloon has just been brought to a satisfactory close, after three months of arduous labour and in spite of a somewhat unpropitious season. The seeds are principally those of the ordinary China fir (*pinus sinensis*), swamp oak (*casuarina equisetifolia*) cocoanut palms, coffee, Morecambe Bay chestnut, cryptomeria japonica, and various other hardy species in minor quantities. Nine nurseries have been established in the localities given in the following table, which also gives the quantity of seed sown and the estimated number of plants expected to be reared, due allowance being made for losses by failure of seed, bad weather, birds, insects, etc, but not by typhoon.

LOCALITY OF NURSERY.	AREA.		SEED		ESTIMATED
	ACRES.		BOWN.		
Kowloon Peninsula.....	8	400	pints.....	6,400,000
Bowrington	2½	122	"	2,100,000
Sookumpoo	3½	220	"	3,500,000
Mt. Shadwell Valley	1½	120	"	2,100,000
New Government Gardens.	2½	41	"	700,000
Albany	0½	82	"	1,400,000
Old Cemetery	2	120	"	2,100,000
Pokfulum	2	118	"	2,050,000
Aberdeen	3½	40	"	700,000
Totals	26½	1,253	"	21,050,000

"These nurseries are designed as centres of supply to the mountain districts in their neighbourhoods, but it is not intended to transfer the young seedlings to the hillsides until they are two years old or at least eighteen inches high.

"In addition to the foregoing, a belt of four thousand young cocoanut palms obtained from Manila will be shortly planted along the northern shore of Stonecutters' Island, and as an experiment, some bushels of fir seed have been scattered broad cast on the slopes of the hills above the Pokfulum Road along the line of the new conduit.

"The whole of the interesting work has, we understand, been ably carried out under the personal supervision of Mr. J. J. Cerneau, a French gardener and forester of considerable attainments lately in the service of the French Legation in Peking, and whose temporary and provisional services the Government were fortunate enough to be able to secure some months ago, pending the arrival of Mr. Ford, who returns to the colony in June next. The bulk of the fir cones were picked from the trees in the Island and from the scanty forests in the neighbouring islands; the latter, with the approval of the Viceroy at Canton, who was addressed through Sir Brooke Robertson and who issued orders to all the local mandarins to give the Hongkong foresters every assistance in their power in the collection of seed.

"We are glad to learn that the outlay of seed-gathering and rearing the young plants has turned out so much less than originally estimated by the Surveyor-General that the Government contemplates extending the scale of its operations very considerably next year, so that the long talked of wooding of the island bids fair to become a reality sooner than was expected.

"The estimated number of trees reared and planted out in past years has been about fifteen thousand per annum as against twenty-one millions this year, a somewhat startling jump, and one which will not be long in producing its effect; and in respect of variety, too, we think a marked improvement has been made in the extensive adoption of the beautiful cryptomeria of Japan and the graceful and feathery casuarina."

THE JAPAN TIMES.

'FAIS CE QUE DOIS; ADVIENNE QUE POURRA.'

NOTICE TO CORRESPONDENTS.

No notice will be taken of anonymous correspondence. Whatever is intended for insertion in the JAPAN TIMES must be authenticated by the name and address of the writer, not for publication, but as a guarantee of good faith.

Manuscripts found unsuitable for our columns will be carefully returned to the writers.

YOKOHAMA: SATURDAY, APRIL 6, 1878.

NOTES OF THE WEEK.

FRIDAY EVENING, APRIL 5th.

THE *Malacca* with the English mail of the 15th of February arrived in harbour this morning, one day ahead of time from England, but a day late from Hongkong. The *China* is expected hourly from San Francisco, having left there on the 4th ulto. and there are two more mail steamers from the same port en route for this, the *Oceanic*, which left on the 19th ulto. due here about the 11th inst., and the *City of Peking*, which sailed on the 1st inst. and is due here about the 23rd. The *Sunda* with the homeward English mail left on Tuesday morning last, due in London the 20th of May, and the *City of Tokio* is advertised to sail to-morrow morning at daylight for San Francisco. For the movements of coasting and China mail steamers we refer our readers to our Shipping Intelligence. We would remind them that in consequence of the change in the monsoon, there will be an alteration next week in the departures of the French and English mail steamers, the French leaving on the 9th and the English on the 10th. Afterwards the French and English mail will leave on alternate Wednesdays.

Again an uneventful week affords us scanty matter wherewith to fill this column. So far greater a degree of interest is felt respecting affairs in Europe than in any other part of the world, that, after glancing at the spot where some later telegram than that we have all seen a few hours previously, and generally finding none, we throw down the evening journal with—"as usual, nothing in the papers." Some excitement was caused late on Thursday afternoon, by the statement that news had been received in Yedo of a declaration of War by Austria alone, against Russia; but this was so utterly improbable, that hardly any one was deceived by the rumour, for which there seems to have been literally no foundation. It is an anxious time, indeed, for all of us, and the news of a declaration of War would be received with almost as much satisfaction, as relieving our suspense, as would be the news that peace had been patched up. A dilapidated, irksome sort of peace it would be, anyway, and our own conviction, we confess, is that war now would be better than such a mere truce, with inevitable war looming in a near future. But of this question, as of the changes in the English Cabinet and other matters of European politics, each little knot of our readers has its own ideas, aspirations and convictions, and all think they know more than they can be told; a frame of mind not precisely calculated to induce a journalist to take the trouble to expound his own special views. We therefore turn to subjects nearer home.

The streets of Yokohama do not present actually any signs of depopulation, but what a number of gaps we all note in our respective social circles. We have referred to Mr. Russell Robertson's approaching departure in another column, when reviewing his literary work: he will be much missed at many a dinner-table, as well as from the Consular Bench: Dr. Birnie Hill's numerous friends are entertaining him with the usual painful series of farewell dinners, and felicitating him on his promotion; and Yokohama will soon know no more Captain Buller of the *Modeste*. In the stirring times approaching, apparently, for the British fleet, so distinguished an officer is not likely to be allowed to remain long

ashore; but until he gets his flag, we suppose, we are not likely to greet him in these waters again. He, too, carries with him many a kindly wish, as he leaves behind the memory of many a kindly deed. The successors to both these officers arrived this morning by the English mail.

The English Admiral left Hongkong on the 3rd inst. in the *Audacious* and is to come hither direct. This will considerably strengthen the British squadron in this waters. On the other hand, we hear that two more Russians are lying at, or cruising near Kagoshima: but this rumour is untraceable to any reliable source. The native papers, by the way, are much exercised about the probable consequences to Japan trade, should war unhappily prove unavoidable: thinking apparently that a dozen Russian frigates can stop British commerce. There is not much cause for alarm on this score, but we shall say a few words on the subject next week.

The arrival of the *Glenarney* last week, gave this community the opportunity of discharging the pleasing duty of thanking Captain Gulland, his officers and crew, for the assistance rendered to the wrecked passengers of the *Meikong* last year, several of whom started from this port. We give a prominent place in our columns to the letter addressed to him and to his reply. It is all very well for Captain Gulland to deprecate our thanking him for doing his duty—but it is not always that duty is done so thoroughly, so unselfishly and so successfully, as when he checked his ship in her own race home, on a dangerous coast, to give the help he did; and he deserves all the praise and all the thanks that can be given to him.

An alarm of fire, of very curious origin, startled the church-going part of the community on Sunday while in the middle of their devotions. The *Gazette* gives the best account of it, and we will therefore take the liberty of transferring that paper's report to our own columns:—

"In a corner of the ground formerly occupied as a British Camp, close to the inhabited house on Lot No. 103 Bluff, stands a closed wooden shed over which still stands the inscription "Blacksmiths' Shop." Close to this, again, is a long open shed, easily accessible, in the present decrepit state of the fencing, from the road. Quite near to these two sheds, and at an angle between them, is the stump of an enormous tree, a *kusu-no-ki*, the circumference of which at the butt is from fifty to sixty feet. Possibly this tree is nearly half as old as the dynasty of the Mikado. From various parts of its ruins spring offshoots, many of them as big as good sized saplings. In the middle of the old mass are various hollows, of various size, eaten out by age and decay, and forming very convenient natural fireplaces. This is the purpose to which they have evidently been put, with the result that might have been anticipated: the first strong wind blew the smouldering fire into a blaze, which was certainly not dangerous in itself, but from its proximity to the above mentioned sheds in the same compound, and the back of the outhouses and the house itself, on No. 103, might have cleared the Bluff of houses thence as far as the British Legation. Fortunately it was discovered in good time, and firemen and police arriving in force, soon succeeded in mastering it. None too soon, however, for it might almost as well have started in a match factory. The buildings around it are as dry as tinder, and the open shed, and the space between it and the tree, were filled with a drift of rubbish and dry leaves."

We fully endorse all the deductions respecting the dangers to which police and municipal mismanagement expose us which our contemporary draws from this accident: and we earnestly trust that it will not slacken in the effort to procure reform which it has initiated and to which we alluded last week. We suppose, as soon as we have got rid of the mails next week, Messrs. Thorn and Darwin, the Choral Society's performance and all the farewell dinners and tiffins to departing friends, we shall hear something more of the proposed public meeting.

The state of the streets of Yokohama is become really a matter that our natural guardians, the Consuls, ought to take up. The trottoirs covered with heaps of building and road materials, the roads mended with such rubbish that the next shower of rain leaves them worse than before they were touched, not a single water-cart to lay the dust by day, not a lantern to indicate danger by night. With our old familiar *choching*, it was possible to find one's way home in those dark hours when only cats and compositors are abroad, but when bereaved of that companion we are indeed bereaved. As happened one wet night last week. Returning from enjoying Mr. Thorn's mystifications, to the *sanctum* where the midnight kerosine is burnt for the benefit of an unappreciative public, the *girikishia* man who conveyed him thither, preferred a petition to the writer (after he had been paid for his work, mark ye) that he would lend him his *choching*, his own candle having been burnt out, and he fearing the police if he went home without a light. His request was reasonable, his manner plausible and polite, and he promised faithfully to bring the lantern back next morning. The carter's reply to *Gadshill* in *Henry IV.* naturally suggested itself at the instant—"Ay, when? Canst tell?—Lend me thy lantern, quotha? Marry, I'll see thee

hanged first:—but then, according to recent writers on Japan the poor man might be a *daimio* who had commuted his pension, or at least a *karo* in reduced circumstances, so that the lantern was lent.

Never has that impecunious aristocrat reappeared with that *choking*, and our faith in the chivalry of Nippon is extinguished for ever.

Mr. Thorn is very clever, and we are extremely pleased to hear that he has found here audiences so appreciative of his talents, that he has decided to prolong his stay. His confidential little anecdote at the Gaiety Theatre on Tuesday night about the Shah of Persia, the Prince of Wales, and the silver ring trick seemed to hit the public; and doubtless, when he performs in Teheran, a similar reminiscence from the Court of the Mikado will be equally effective. Now, if our readers expect us to tell them how Mr. Thorn deceives them, they are much deceived themselves: people who go to see such a performance as his, go to be mystified and pay their money for that purpose. They are mystified:—with that let them be content. If all the tricks were explained to them—as they could easily be explained—for, really, as in any other art, a very few leading principles are the foundation of all mystifications of the *prestidigitateur*; what advantage would they gain? Their admiration of Mr. Thorn's performances would be greatly lessened, and the next wizard who attempted to amuse them would fail in his object. But though Mr. Thorn shows us nothing absolutely new, the grace and perfect finish of his handling have a charm of their own, which afford an all-sufficient pleasure. Even while he affects to show how a card is 'passed'—doing it slowly before one's very eyes, the king of diamonds seems positively to melt into the deuce of clubs, instead of being replaced by it; and that he has conquered the *ars celare artem*, and made the faculty a thoroughly obedient slave is best shown by the few card tricks which he exhibits, *en famille*, as it were, to the first row of the stalls. Next to his card tricks, Mr. Thorn's extraordinary facial contortions are the most remarkable part of his entertainment. With nothing but a tight fitting skull-cap, and adjustment of his own hair; without paint, wig or padding, he gives four living, breathing portraits of as many different types of misers, ending with that of the happy miser who has just found a shilling. Were this the only thing this very clever young gentleman does, it would be well worth going to see, for the manner in which at last, he makes his face into a dissolving view of all four faces in succession in plain sight of his audience is as ludicrous as it is uncommon. We wish Messrs. Thorn and Darwin a thoroughly successful season here and in Tokio: assuredly no one should miss seeing them before they finally take their departure.

Mr. Wirgman has favoured us with another number of *Punch*, and a very successful one. This artist, in his caricatures, is equally happy with Sydney Smith in his epigrams: his wit tickles, but never wounds; if he wrote his own text as well as drew his own pictures—or had he a *collaborateur* endowed with as much tact as is his own happy property, his periodical would be perfection in its way. As it is, his colleague is generally stupid, and always spiteful. '*Sed non curis*'—the quotation is something musty.

The Choral Society's performance, for the benefit of the China Famine Fund, is officially announced, and set for next Wednesday. As might be imagined, the seats in the house are already almost all taken; and the ladies and gentlemen who are taking so much trouble in getting up 'Trial by Jury' and 'Atchee' will have a large and appreciative audience. From all we hear, it appears certain that Yokohama will have such an evening's entertainment as it has never yet enjoyed.

An odd example of what we may call 'natural magic' has been brought to our notice this week. A short time ago a letter appeared in one of the daily papers from a correspondent, who said he had seen smoke issuing from the summit of Fujiyama. This was answered by another, who stated that it was not smoke, but snow drift from the sides of the mountain, carried into space by strong wind and thus giving the appearance of smoke. We are informed by a pedestrian who was close under the Hakone range on Sunday last, the atmosphere being intensely clear and brilliant, that these snow drifts would mislead any one unacquainted with the fact that the old volcano had ceased to be active: in fact our informant seemed inclined to be almost sceptical on the subject himself; the light airy clouds seeming to come out of the very crater both voluminous and continuous for some hours, corresponding in colour to the real smoke seen issuing from Vries, which was clearly visible to the left. Dr. Naumann notices how, for some months last year, the inhabitants of the country round the matchless mountain were alarmed by noises below ground and appearance of smoke from the sides of the peak. The smoke seems to be easily accounted for, may not its appearance have induced the people to imagine the noises?

As these notes of the week are being set up, the bell of the Roman Catholic Church gives notice of a fire, Ha! soon and happily over. It broke out at No. 10 on the bund, occupied by M. J. J. Fourcade, originating, as is so often the case, in the cook-house; the front door being broken open, willing hands soon carried a large quantity of furniture and stores to a place of safety, but it was not until the flames had got a good hold of the building, that inmates were discovered in a room in rear of the building, burning rafters already falling into the room whence they were conducted out by one of the volunteer firemen. At the outbreak of the fire, the premises were supposed to be untenanted. Two steam and several hand engines soon got the mastery, but before the engines began to play, the large block of buildings to the left was in considerable danger.

Spring comes very late this year. We had a day or two's rain and a day's sun, which brought out all the tender young shoots of vegetation with a rush; but now follow two or three days apparently cut out of February, as if 1878 had suddenly been deluded into the notion that he was a leap-year, and had omitted to take his privileges at the proper time: the burgeoning of the foliage is checked, the dicky-birds seem disheartened, skies and sea turn from sapphire to slate-colour, and deluded mankind, having left off its flannel waistcoats, goes about as if everybody was engaged in 'Atchee' and was constantly rehearsing his part. Which is unreasonable.

As we go to press, we hear with regret of the total loss of the British barque *Fire Queen* of Cape Ishinomake, Sendai, on her way to Hakodate with a large general cargo. Happily the crew were all saved.

NOTES AND QUERIES.

QUERIES.

Qy. 2. Where can I find any account of the ceremonies in use on the occasion of birth, death, or marriage, among the Japanese? Do any of the French, Dutch or German works on Japan contain such? I fail to find any information on the subject in English books. A work like Sir John Davis' "The Chinese" is a great desideratum in Japan.

(In process of answer.) B. H.

Qy. 6. Can any of your readers inform me whether there are any, and if so, what books on Japanese surgery, or midwifery, as practised before the coming of the Dutch and Portuguese?

(Unanswered.) Z.

Qy. 8. Mr. Bramsen's interesting note on the relative values of coins in your issue of February 23th, leads me to think that he may possibly be good enough to clear up a few points which have frequently occurred to me:—

1.—Can he say when, and under what circumstances, paper money was first issued in Japan? "Shosei" in your issue of March 9th gave a most interesting account of the *Han* paper money; and perhaps if there were a general issue before that, Mr. Bramsen may be able to do the same for it.

2.—Copper was first coined in Japan, I believe, in the Wadô period (708-715); does Mr. Bramsen know whether the nominal values of the coins made then, and also up to the time of Nobunaga, were restricted to the same denomination as afterward? The Tempô was of course named in the Tempô period (1830-1844).

3.—Can he give any account of the regulations (if any) which governed coining under the feudal system? For instance, under what circumstances was permission granted to certain individuals to strike coins? This seems to have been done at various parts of the country, thus we have Musashi Ichibu, Suruga Koban, &c., I trust that Mr. Bramsen will pardon the liberty I take in addressing myself to him; but if he should ever put a query in "Notes and Queries" which I can answer (which is doubtful), I promise him that I shall do so to the best of my ability.

It may interest coin collectors to know that a collection of copper coins, which consisted of eighty-six specimens; four of which were said to belong to the eighth century of the Christian era, six to the ninth, two to the tenth, two

to the sixteenth, thirty-five to the seventeenth, and the remainder to the eighteenth and nineteenth centuries, was offered for sale a few months ago in Tokiō for twenty yen.

X.

Qr. 9. I want information as to the locality of the signature of the original Treaty with Japan by Commodore Perry. Treaty Point, a mile or so away from the town indicates the spot: but was the treaty signed there in the Temple at Homoko, near which the butcheries now stand; or was it under a group of trees which stood on the site of the present British Consulate? I have heard both places assigned as the scene of the transaction.

B. A.

NOTES.

NOTE TO QUERY 8. (Copper coins of Japan). While unable at present to answer Nos. 1 and 3 of the questions addressed to me by "X," I may give him some information on the subject of his query No. 2.

Copper was probably coined in Japan somewhat before the period *Wa dō* (708—715). Already in *Haku hō*, 12th year (683) copper money is mentioned in a Government notification, ordering "that silver cash must be discontinued, and henceforth only copper cash used." At that time, however, no find of copper in Japan is yet mentioned, so it is reasonable to surmise, either that the copper cash then used were imported from abroad, or that they were coined in Japan from metal brought there from Corea, whence copper and other metals are repeatedly said to have been received, both before and after the period in question.

In the second year of the period *Bun mu* (698) copper was discovered in Japan, in *Inaba* and *Suwō*, and in the following year the *Chiu sen shi* (Coining office) was established. As certain old works give a drawing of a copper coin said to have been in use about that time, there can hardly be any doubt, that we have here a coin issued by the said "*Chiu sen shi*" some time before the period *Wadō*. The coin in question bears no characters, but merely four ornaments (flowers?) round the hole in the centre, and owing to this absence of inscription it is called *Mu mon dō sen*.

I subjoin a list of all the copper coins known to have been issued by the government:—

NAME.	TIME OF ISSUE.		NOMINAL VALUE.
	JAPANESE ERA.	A. D.	
<i>Mu mon dō sen</i>	Between <i>Haku hō</i> and <i>Wadō</i> ; probably in <i>Bun mu</i> 3rd year.	Between 672 & 708 probably in 699	1 mon.
<i>Wa dō kai chin...</i>	<i>Wa dō</i> 1st year	708	1 "
<i>Ban nen tsū hō...</i>	<i>Tem piyō Hō</i> 4th year	760	1 "
<i>Jin gō kai hō ...</i>	<i>Tem piyō Jin gō</i> 1st	765	1 "
<i>Riu hei yei hō ...</i>	<i>Yen reki</i> 15th year...	796	1 "
<i>Fu ju jin pō.....</i>	<i>Kō nin</i> 9th " ...	818	1 "
<i>Shō wa shō hō...</i>	<i>Shō wa</i> 2nd " ...	835	1 "
<i>Chō nen tai hō...</i>	<i>Ka shō</i> 1st " ...	848	1 "
<i>Niō yeki jin pō...</i>	<i>Jo guwan</i> 1st " ...	859	1 "
<i>Jo guan yei hō...</i>	<i>Do.</i> 12th " ...	870	1 "
<i>Kuwam pei dai hō</i>	<i>Kwam pei</i> 1st " ...	889	1 "
<i>Yen gi tsū hō ...</i>	<i>Yen gi</i> 7th " ...	907	1 "
<i>Ken gen dai hō...</i>	<i>Ten toku</i> 2nd " ...	958	1 "
<i>Ken kon tsū hō(1)</i>	<i>Kem bu</i> 1st " ...	1334	1 "
<i>Ten shō tsū hō...</i>	<i>Ten shō</i> 15th " ...	1587	1 "
<i>Bun roku tsū hō...</i>	<i>Bun roku</i> 1st " ...	1592	1 "
<i>Kei chō tsū hō...</i>	<i>Kei chō</i> 11th " ...	1606	1 "
<i>Gen wa tsū hō...</i>	<i>Gen wa</i> 3rd " ...	1617	1 "
<i>Kwan yei tsū hō...</i>	<i>Kwan yei</i> 13th " ...	1636	1 "
<i>Chō kio tsū hō...</i>	<i>Chō kio</i> 1st " ...	1684	1 "
<i>Hō yei tsū hō (2)</i>	<i>Hō yei</i> 5th " ...	1708	10 "
<i>Kio hō tsū hō ...</i>	<i>Kio hō</i> 1st " ...	1716	1 "
<i>Kwan yei tsū hō(3)</i>	<i>Mei wa</i> 5th " ...	1768	4 "
<i>Tem pō tsū hō (4)</i>	<i>Tem pō</i> 6th " ...	1835	100 "
<i>Bun kiu hei hō...</i>	<i>Bun kiu</i> 3rd " ...	1863	4 "

[N.B.—Not having the necessary accented letters at hand in this type, we have been compelled to supply their places by O and U. The appearance of the table is spoilt, but Japanese students will probably prefer these letters to unaccented ones. Ed. J. T.]

The above list does not contain 1st Provincial coins—as those of Sendai and Akita; 2nd Coins issued by private

(1) Now unknown.

(2) Also called *Tai sen*.

(3) Brass. Also called *Nami sen*.

(4) Also called *To hiyaku*.

individuals, as the *Gin tai tsū hō* (1703); 3rd Copper coins of which specimens were cast, without, however, being put into circulation, as the *Gen roku kai chin* (1693); and 4th, the numerous re-coinages of the *Kwan yei Ichi mon sen*.

"X" will see from this table, that until the beginning of the 18th century all copper coins were of the denomination of 1 Mon, while after that time coins of 4, 10 and 100 Mon were issued.

I may here mention that up to the *Ken kon tsū hō* the four characters which are found on one side of the coins, read in the following order 上; while those on the coins from the *Ten shō* and later periods are arranged thus 下.

The copper cash now in use are:—

<i>Kwan yei tsū hō</i>	Originally 1 Mon, now	10 Mon.
<i>Bun kiu hei hō</i>	" 4 " "	15 "
<i>Kwan yei nami sen</i> —(Brass.) ..	" 4 " "	20 "
<i>Tem pō tō hiyaku</i>	" 100 " "	80 "

Your correspondent "N. or M." takes exception to two statements made by me; 1st, that *Oban* and *Koban* were for the first time coined in the period *Tenshō* (1573-1591); and 2nd, that during the *Kenji* period (1275-1278) the only coins in use were copper cash. "N. or M." also enumerates a quantity of coins, all supposed to have been issued prior to the *Tenshō* period. The dates of the issue of these coins are, however, not so certain as "N. or M." seems to think: the "*Kin gin zu roku*," until quite lately the only work on the subject,—and from which I believe "N. or M." quotes the coins he mentions—has nothing definite to say about the majority of them. Thus the author says it is doubtful whether the "*Hidehira Koban*" was coined by *Hidehira*; the *Yeshikuan Oban*, though reported to have been coined by *Imagawa Yoshimoto*, was probably issued by a different person and in a later period; the *Sei chō* or *Shō chō koban* is by some people believed to date from the period of the same name, merely because the two characters 正長 are found on it, while others think it was coined at a more recent date by a person called *Masa-naga*, this being another pronunciation of the same two characters. (By the bye, is "N. or M." not mistaken in styling the *Koyasu koban* "the most highly ornamented of all the gold coins," for it is an extremely plain one, merely bearing the two characters "*Ko yasū*." Does he not mean the *Kodachi koban*, also called *Tsuchiura Kodachi koban*, which was very much valued on account of its beauty and finish?)

Whatever may be the dates, of issue of the gold coins enumerated, my statement was nothing but a quotation from the *Kin gin zu roku*, whose author in Vol. 1, on the first page after the introduction, says: "It is my opinion that gold *oban* and *koban* were first coined in *Ten-shō*." By this he probably means that in the said period *oban* and *koban* were first coined as currency; and while I will acknowledge that some of the coins mentioned by "N. or M." existed before *Tenshō*, I am convinced they were not current as a commercial medium. In proof of this, as well as of my second assertion, viz: that in the period *Kenji* only copper cash were used, I will quote the "*Dai Nippon Kuwa-hei shi*," a work in 26 vols, recently published by the *Okurashō*. Its author, Mr. Yoshida Kensuke, whom "N. or M." will of course acknowledge to be "a reliable authority," says in Part I, Vol. 3, page 18-20:

"In the third year of the period *Ken-ji* (1277) the Emperor *Go-uta* sent a merchant to China with Gold (i.e. uncoined gold), therewith to buy Copper cash."

"After that, the Shōgun *Ashikaga Yoshimitsu**, *Ashikaga Yoshinori* and *Ashikaga Yoshimasa*† likewise sent gold to China wherewith to purchase copper money."

"This shows that large quantities of gold were exported from Japan. Gold and Silver were, however, then not used as money in the shape of coins, but taken by weight in irregular pieces. Even if gold coins did exist, they must have been very scarce, and the use of precious metals was limited to ornaments on armour, saddles, swords etc. At times gold was given to prominent persons as a mark of distinction, and sometimes it was sent as a present to foreign governments. But the general circulating medium was only copper cash, which were quite adequate to the requirements of the time. Later,

* In the latter part of the 14th century.—W.B.

† Both in the earlier part of the 15th century.—W.B.

"however, it was found convenient to use gold and silver as currency; and about the period *Tenshō* some of the greater Daimiōs issued gold and silver coins in their dominions; and when the Government, from *Tenshō* up to *Kwanyei*, permitted foreign ships to trade in Japan and native vessels to go abroad, the importance of a gold and silver currency became still more manifest."

WILLIAM BRAMSEN.

THE TIMES OF TAIKO.

(FROM THE JAPANESE.)

BY F. BRINKLEY, CAPT. R. A.

ISHIKAWA GOYEMON.

Chapter XIV. THE LAPWING CENSER.

TWO things were certain: the first, that though the total of the sum in the palace Treasury remained the same, the units composing it had been changed; the second, that the history of this change was known to the Regent.

Of the latter fact Ishida was made cognizant by certain expressions Taiko let fall during an interview with Sir Tajima, the monitor, who, sick at heart and physically broken down, came a few days after the examination of the Treasury and asked permission to resign his post. He did not utter a word that accused the Minister, but when Taiko, finding him unnecessarily hopeless of his own recovery and persistent in his entreaties for the appointment of a substitute, told him that if the nobles repaid and the monitors resigned, Hidetsugu would in the end find himself without either allies or advisers; Sir Tajima replied significantly:—"Your Highness' adopted son is independent of everything but his father's favour."

Either, however, through reluctance born of affection, or because action would have involved processes too minute to be dignified, this knowledge of the Regent's remained without apparent fruit. Ishida therefore, recovering from the momentary paralysis of dread, began to be quickened by his old desires, and set himself to consummate a scheme contrived so as to reach no further than Hidetsugu's banishment; for the Minister's household might follow him to death but not into exile.

But every day added to the Regent's life multiplied the Lady Yodo's impatience. A woman's intuition disclosed to her Sir Ishida's irresolution; a mother's solicitude determined her to stimulate it.

The Baron had not visited her for three days, nor had he, they said, been at court: an absence which, if further prolonged, would become remarkable. Tomorrow no doubt must bring him to Fushimi, and with this hope she was fain to be content.

But the morrow rose wet and gloomy: a summer rain hurrying down busy and impetuous, as though conscious of the parched eagerness that awaited its advent.

The ladies of the court sat, some reading, some listlessly watching the crystal drops as they crept into the hollows of the lotus leaves, or the sparrows as with querulous twitter they shook the rain from their ruffled feathers. A few, with scissors and paint-brush, were busily engaged in constructing a paper effigy to recall the sunshine, and five or six of the youngest were examining a picture, which they passed from one to the other, and about which each was expressing her opinion so excitedly that their animation attracted Lady Yodo's attention.

"You seem to have something very interesting there, Matsū," said she addressing one of the fair disputants, who was pointing with her hairpin to a figure in the picture, and speaking with all the volubility of a woman when she dreads interruption.

"Your Ladyship," cried another of the girls, "Matsū maintains that this picture represents a scene from the life of 'the three days' King,' just as if all the world would have suddenly become excited about such a matter."

"Is all the world excited about it then?" asked Lady Yodo.

"So it would seem, your Ladyship. The person who gave me the picture said that nearly everyone in Kiyoto has a copy of it."

"And who may the person be, Miss Yuki?" enquired Lady Yodo, smiling:—

"Sir Ishida's head agent, of course, your Ladyship," cried two or three of the girls in the same breath, clapping their

hands with delight at the blushing confusion their words caused poor Yuki.

"Sir Ishida is then at court today," thought Lady Yodo, as she took the picture and began to examine it.

Two scenes were represented. On the right, surrounded by some thirty or forty ladies, a nobleman, evidently of the highest rank, sat beside a lovely girl of sixteen or seventeen, who was in the act of handing him a wine-cup, and underneath was written this verse:

"In woman's lot, unequal fate,

"Thy partial laws are shown,

"Her joy she gives to glad her mate,

"Her grief is all her own."

On the left, a middle-aged woman of graceful mien and beautiful features, kneeled before a shrine, holding in her hand a votive tablet, on which the painter, with great skill, had reproduced the young cup-bearer of the opposite group. Here was subscribed the following couplet:

"Human or brute shall he be styled

"That makes the mother curse her child?"

All this was as enigmatical to Lady Yodo as to her attendants, but it inspired her with more curiosity, for in the nobleman's face she fancied that the recognised Hidetsugu's likeness. While she was busied with conjectures, Sir Ishida entered.

He denied all knowledge of the picture when it was first showed to him, but seeing that he had answered almost without reading the verses, Lady Yodo understood that his denial was dictated by expediency. She therefore desired her attendants to withdraw, and as soon as she found herself alone with Sir Ishida, repeated her question.

"Madame," he said, "the story this picture represents is almost too disgraceful to be credible. The wife of a gentleman banished from court some time ago, subsequently entered the household of a certain nobleman at Kiyoto. The woman had a daughter Miya, aged sixteen, and seeing herself comfortably settled, her thoughts naturally reverted to her child. Miya was sent for, and came to live with her mother. But her beauty, which was very great, attracted the nobleman's attention, and he made her also his concubine, giving the two separate apartments, indeed, but not the ability to forget they were human beings. The daughter was in the spring of life, the mother in the autumn, and their master's affections soon began to be so unequally distributed, that the mother became her daughter's suppliant for a share of the heart she had once possessed entirely herself. Her prayers were answered with contempt and disdain, so that in the end, to the loss of her child and her lover, she added that of her reason, and invoked the curses of the gods on her own daughter's head. Her's is the figure on the left kneeling at the shrine, while the group on the right represents the daughter, the nobleman and the other ladies of his household."

"Can it be possible that such inhumanity exists among human beings?" said Lady Yodo, horrified.

"Your Ladyship's reflection is the same that dictated the shorter of these couplets," replied Ishida, pointing to the writing on the left of the picture.

"But surely the story can contain but a very small grain of verity?"

"Things are not less true because they are repulsive, Lady Yodo. The picture not only represents a reality, but a reality in the life of the Prime Minister himself."

Yodo had anticipated this announcement, but not the storm of jealous rancour into which it stirred her woman's nature. "Oh! that we women were freed," she cried, "from the conventionality that relegates our nobler impulses to the region of gossip and inaction! Better be blind and senseless than thus, with open eyes and beating hearts, be obliged to respect those who tolerate such a disgrace to their manhood and their nation. Has the Regent no longer a counsellor, Sir Ishida, nor justice an ally?"

"Madame," replied the Baron, quite unmoved by this vehement appeal, "the graver the crime, the clearer must be the proof and the more deliberate the judgment. It often happens, that in trying to precipitate justice, we disable it completely."

"Is not this picture ample proof?" demanded Lady Yodo, for Ishida's judicious reserve had driven her to the extreme of credulity. "Who could conceive or dare to promulgate such a story, were it false? And even if it be a falsehood, is there not all the more reason for immediate investigation? But enough," she continued, folding up the picture and

putting it in her girdle. "If your pale prudence cannot be warmed into action by either loyalty or affection, I will take my own measures. Taiko perhaps will be less delicately scrupulous."

So spake Lady Yodo, flushed with indignant purpose, and little knowing that Ishida himself had caused this picture to be painted and distributed. But he, divided between amusement and surprise at the ardour that swept its own author into oblivion, like the foam surging over and hiding the rock that causes it, instead of attempting to convince Lady Yodo of his sympathy, found himself contrasting these rich overflowing emotions, this exuberance of womanhood, with the tender grace of the image his heart worshipped. For Yodo, handsome, blooming, and nobly proportioned, had gathered from nature and experience a wealth of passion and pathos, that in repose surrounded her with a soft, voluptuous lustre, but in times of excitement, glowed and flashed into the most ardent vitality.

"The picture would amply justify a remonstrance from your Ladyship," he said, "but it would scarcely warrant an official representation from us. Should the Regent question us, indeed, we may find means of confirming any opinion your Ladyship has already suggested."

Nevertheless when Taiko, at a secret meeting of his Council the next day, sought some information about the picture, Ishida was one of those who professed complete ignorance. He was now acting a part to which the rôle of intercessor might not be inaptly added hereafter.

The Councillor Nagatsuka alone replied to the Regent's questions; nor did he mention any names, but merely explaining the mutual relation of the various figures in the painting, added that men who were versed in such matters, regarded this picture as the forerunner of some national catastrophe to be induced by the inhuman crimes it depicted.

"These creations of rumour," said Ishida, are only magnified by observation, while on the other hand they contain in themselves the germ of confirmation or contradiction. I should counsel Your Highness to make no enquiries, but let the truth develop itself."

But Taiko, already taught by Lady Yodo, gathered assurance from this very reticence, and now for the first time began openly to discuss the advisability of removing Hidetsugu.

As soon as Ishida had satisfied himself of this mood of the Regent's, he sent Seta Kamon again to the Palace of Pleasure.

Received as before in the Tea Pavilion, Seta congratulated the Minister on the happy termination of the Treasury examination, and then, presenting him with a copy of the fatal picture, described the effect it had produced at court. The Regent, he said, was so exasperated, that he refused to make any official enquiry, declaring that he did not choose to run the risk of evoking another perjury. A father least of all should suffer such crimes in his son, and despite the courtiers' entreaties, he had resolved to take the most extreme measures. Seta therefore counselled Hidetsugu to anticipate this catastrophe by sending his monitors at once with a distinct denial of the imputation.

But unfortunately the imputation was true, and Seta Kamon's intelligence only confirmed a resolution that had long been maturing in the Minister's mind. He dismissed his visitor with a courteous expression of thanks, and not the slightest evidence of consternation or concern; so that Seta, on his return, could only describe his own astonishment to Sir Ishida.

"Such composure conceals a purpose" remarked Ishida. "We may leave the rest to the Minister himself." And he was right.

His day's duty completed, Fuwa Bansaku left the palace but a few moments before Seta Kamon. On his way home he alighted from his horse to greet Ishikawa Goyemon, whom he met in the street after a separation of many months. "Our evil fate was abroad, and brought us all together on that day," said the comptroller in after times, and with much show of reason.

The two men had separated, and Bansaku was about to remount his horse, when a messenger arrived recalling him to the palace. He obeyed, but not without misgivings, for in those days Hidetsugu's most devoted vassals lived in a state of apprehension that everything extraordinary quickened.

The memory of a half-uttered treason revisited him with painful distinctness, when he found himself, in his master's presence. All the circumstances of his interview two months before found their counterpart to-day. A warmer breeze in-

deed, a louder hum of insects, the mimosa blooming in the cherry's stead and the iris in the azalea's, but for the rest, the gloaming, the Tea Pavilion, the solitude and the Minister's troubled aspect: every component of a scene that sorrow had preserved unfading, and superstition shuddered to see renewed.

Yet one difference there was, and Bansaku detected it almost immediately. Hidetsugu's vacillation had disappeared. Beckoning the comptroller to his side, he showed him the picture, and repeated Seta Kamon's story briefly and in a tone that forbade comment. Then, looking full in his vassal's face, he said:—

"To-day decides my fate: whether I shall conquer and live, or submit and die. Bansaku, which shall it be?"

"Your Excellency, spare me the pain of a question that proves how little you trust me," replied Bansaku, raising his head, and nerving himself to meet the crisis he felt approaching.

"You told me once," continued Hidetsugu with the same set, unflinching accent, "that I might command your life. I have never until this moment conceived any circumstances that could persuade me to accept your offer, but I do so now."

It was impossible to misconstrue the expression of the comptroller's face at that moment. To leave the world with the thanks of his benefactor sounding in his ears, and the hope of preventing a disgrace he now regarded as almost inevitable: what prospect could be pleasanter to this man of inimitable faith and fearlessness? If Hidetsugu's purpose wavered a moment, it was surely when that look of generous joy sharpened the sorrow of sacrificing so much that was noble and chivalrous.

"If I succeed in my design," he resumed, "success will justify my conduct to the world, but to myself, not the certain loss of my rank and life, and scarcely the consequent calamity of the nation seems a sufficient warrant. Yet since history finds nothing but praise, for Taiko who shot his brother, and Takeda who exiled his father, to help the people in their peril, and since this is certainly a crisis of no less moment, I too have chosen between my father and my country."

Here for the first time Hidetsugu seemed to find himself embarrassed. He turned his head away and continued with painful effort:—

"Bansaku, a single deed, easily and quickly accomplished, will constitute you the benefactor of the people, the Regent and myself. You have but to make your way into Taiko's room to-night, and shortening his life by, it may be a year, it may be a few months, prevent him from achieving a mistake that would not only recall the anarchy and bloodshed of past years, but tarnish the fame of his own greatness. You have an art that makes this possible, and I firmly believe that fate taught it you for this end. (Can I count on your devotion, or will you too desert me in the hour of peril?)"

But Bansaku, trembling with horror, had hidden his face and for a long time made no attempt to reply. When at last he spoke—in a low broken voice so changed that Hidetsugu started and looked round in astonishment—it seemed as though his words were less a reply to the Minister than an appeal to his own waning faith.

"It was spoken without reflection," he muttered, "Surely without reflection and in the confusion of the spell their sorceries have wrought. The highest office a subject can attain, the guardianship of the Emperor himself; all this the gift of Taiko, and all this to end in ingratitude and murder!" Then suddenly flashing into a fervour of instance and expostulation, he cried:—"Have I no strength to turn your Excellency from this purpose? Will you not rather bid me strike those that stand between your father and yourself; those whose plots and slanders have for a moment estranged the affection that adopted you and made you what you are? Will the Regent's death rid you of these, your real enemies? The Gods will not bless you, the people will not reverence you, and peace will never visit you after such an act."

"All these reflections have been powerless to prevent my resolution as they are now to shake it," replied Hidetsugu. "But you, you have effected what no argument or consideration could have achieved. For I tell you that, deserted by the one friend in whom I trusted; abandoned by the one servant whom I believed for ever bound to me by ties of gratitude and fealty, I have no more strength to struggle against my fate; no heart to prolong this bitter existence."

Bansaku, with his head bowed upon the ground, writhed at these words like a man in agony, but did not speak or look

up. During the silence that ensued he was conscious of some movement beside him, and presently he heard his master's voice saying:—

"You have refused my last request, Bansaku. I now call on you to obey my last order. You will perhaps remember hereafter that the final act of my life was destined to save you from the consequences of my disgrace." *

Bansaku sprang up, terrified by these solemn accents. Hidetsugu, his features contracted with anguish and resolution, his eyes bloodshot, and a ghastly pallor deepening on his face, had bared his breast and holding a naked poniard in his right hand, pushed a sword towards the comptroller with his left.

"Come Bansaku," he whispered hoarsely, "the stroke will cost you little effort and gain you many thanks," and so saying, he raised the sword so that its hilt touched the comptroller's fingers.

But Bansaku, shrinking from the contact as though it scorched him, fell rather than prostrated himself before his master.

"Forgive me," he said, "if I hesitated a moment. Your Excellency knows well that neither in life nor in death will I ever desert you. If it must be so; if indeed there is no other remedy, command me for good on for evil. The Regent was once my master," he continued with a groan of inexpressible anguish, "and the just gods will bear me witness hereafter, that not to save everything I love in the world from torture and death would I have stretched out a hand of menace towards him. But my curse is that I must choose between your Excellency and him, and I swear that the everlasting punishment of this unfilial and unfaithful deed shall not deter me if you will it otherwise."

The grievous pain this avowal caused Bansaku did not escape Hidetsugu. He laid his hand with much show of affection on his vassal's arm, and said earnestly:—

"Your devotion has given me what I well know the whole world could not have purchased. Be assured that you have my fullest appreciation and gratitude for the gift, though I could almost wish fate had never made us master and vassal, when I see the sorrow this relation has brought you: But our resolution is taken. Let us waste no more time in these reflections. The more speedy the execution, the more certain the success."

"Success! Your Excellency," replied Bansaku. "I have little, very little hope of success in this matter. I can, I believe, make my way safely through the sentries and bodyguards, but beyond all these there is a difficulty that seems insurmountable."

"The phantom of ill-fame, that stands between superstition and enterprise, I suppose," said Hidetsugu half-sneeringly.

"Your Excellency, he that engages himself to commit a crime, adds but little to his guilt by perpetration. I have promised; and though I can no longer claim the credit due to an honourable man, I could at least have hoped that my want of confidence might not now be attributed to reluctance."

"Pardon me, Bansaku," said the Minister. My words were not suggested by doubt, but simply by the memory of our former conversation. What then is this difficulty you dread?"

"Has your Excellency never heard of the 'Lapwing censor'?" demanded Bansaku in surprise.

"Yes," replied Hidetsugu, "I have heard it described by Lady Yodo, if I remember rightly."

"Then your Excellency is no doubt acquainted with its properties?"

"I cannot say that I am," Hidetsugu answered. "Though your question reminds me of some story they tell about a Lapwing's cry heard at times in the castle by night. But these fables that assign vitality and animation to the artist's creations are a very old method of paying tribute to genius."

"If that were all, your Excellency," objected Bansaku, shaking his head incredulously, "why should the Regent cause the censor to be placed by his bedside every night, as he has done for the last four years?"

"Simply because utility is the offspring of use," answered Hidetsugu, seeking to impart a tone of confidence to his words, for he saw that the comptroller's conviction was deep-rooted. "Men avoid a snake if they believe it to be poisonous, though they would crush it under foot if they knew it harmless. And so, too, Taiko's censor probably owes its efficacy to a superstition fostered by the Regent himself."

* Suicide at this period would probably have secured the Minister's vassals against being involved in his punishment.

"No, no, your Excellency," replied Bansaku, quietly putting aside this explanation. "There is evidence that proves the censor's properties beyond a doubt. So surely as a foot crosses the threshold of His Highness' room after night-fall, so surely the Lapwing's warning cry is heard."

It mattered little whether this story was true or false, so long as Bansaku believed it, and Hidetsugu not only acknowledged this, but felt his own scepticism violently shaken by the comptroller's assurance. He had heard much about this Lapwing censor, very much more indeed than he cared to confess at that moment, and though he scoffed at the idea of anything miraculous, it was, after all, easier to conceive that the censor concealed some subtle mechanism, than to attribute its history entirely to imagination. At any rate, though Bansaku's faith in such a supernatural guardian might not deter, it would certainly deprive him of the most vital auxiliary in all enterprise, confidence.

"There must be no possibility of failure, Bansaku, or at least we must omit nothing that may help to obviate such a possibility," said the Minister earnestly, for at that moment fancy conjured up an appalling picture of his faithful servant taken prisoner, and the truth torn from him by some insufferable torture. "It cannot be that this embarrassment is insurmountable."

"No, your Excellency," replied Bansaku, "a science by which all such talismans may be neutralized exists, they say, but I possess none of its secrets. There is one man whose aid I believe would be effectual, could we only command it, but certainly my own request alone would not suffice for that purpose."

"To whom do you allude, Bansaku?" demanded Hidetsugu. "Perhaps the deficiency of your influence may be supplied by the Prime Minister's."

"Ishikawa Goyemon, who taught me the art I am now to employ, answered Bansaku. "If I have authority to use your Excellency's name, I think I can promise to succeed with him, for though he has refused all my offers, he will surely find something to ask for when the Prime Minister is the giver."

"Use my name for all that it is worth, and so long as it is worth anything," said Hidetsugu with a melancholy smile. "When everything is at stake, nothing need be grudged."

Ishikawa Goyemon was then living in one of the least, populous suburbs of Kiyoto. His house stood at the verge of a lofty plateau, whence, across a myriad-meshed network of street and structure, the eye reached a wide belt of woodland, homestead and garden, pleasantly interspersed and blending into a shadowy similitude at the feet of the distant mountains. The selection of this retreat was the one concession Goyemon had made to his past habits in abandoning them. Not because he loved to watch the breath of the awakened world steal softly up the hill-slopes in the morning and creep back, wan and ghostlike, to the bosom of the valley at sunset; nor yet because the breeze came from the south fresh and unobstructed, or broken only by the pulses life throbbing up from the heart of the great city below; nor yet because in winter the snow, and in summer the sun, sparkled on forests of high peaked roofs, and long lines of rampart and buttress separating magnificence from the multitude, but simply because this was the loftiest spot in the metropolis, and as little included within the boundaries of any fosse or monument as the career of the bandit chief had been trammelled by rule or routine. It was indeed a delight, not less keen because it was derisive, to look down calmly at the arena where he had played so conspicuous and yet so unsuspected a part, and from which at the last he had sauntered away with a full purse and a smiling lip; a dainty satisfaction to listen to the hum and tumult of the greedy multitudes, as they struggled and toiled to accumulate the ingots of which so many had passed, unearned, into his hands. He had dismissed his followers and discarded his craft, not at the instance of prudence or content, but because the very feeble spark of aristocracy that still smouldered in his nature had been fanned by success into a finer ambition than a brigand's trade could satisfy; an ambition which fate, of reaching its results through inconsistent processes, made use of to accomplish one of the cruellest destinies ever conceived or recorded.

Bansaku, well knowing the intractable nature with which he had to deal, resolved to waive considerations of rank and etiquette, and proceed himself to visit Ishikawa. Dismissing, therefore, all his retinue with the exception of one confidential servant, he left the palace on foot, guided by the information he had so opportunely obtained that very day.

It was nearly midnight before he reached his destination, and more than once his servant cautioned him against dangers that seemed to menace them on the way, for their route led them at times through lonely and deserted parts of the city. But these warnings found Bansaku indifferent if not reckless. On one occasion indeed, when the feeble starlight showed them two figures shrinking behind the trunk of a huge pine that narrowed the path, the comptroller, peremptorily ordering his follower to halt, advanced himself and passed slowly under the shadow of the tree, not an arm's length from the point of peril, and if at that moment the sword of an enemy or an assassin had saved his honour from impending ruin, Bansaku would assuredly have died with a heart full of gratitude. But fate had no such kindness in store for him.

Ishikawa, roused from sleep, welcomed the Prime Minister's chief comptroller just as though his visit was the most natural thing in the world. "He comes to ask some favour of me," he said to himself, and I shall take care that this profitless condescension does not enter into the balance of inducement." There was little need, however, for such diplomatic reserve with the simple-hearted comptroller. It is questionable whether at any time he had accredited his own dignity with half the influence it really commanded, and now certainly, the shadow of self-accusation had so obscured all the brightness of his titles, that every honest man seemed a noble in his sight.

"You have chosen a very remote spot for your retreat, Ishikawa. I almost think I should have deferred my visit until daylight, had I anticipated such a journey," said Bansaku, dropping his eyes as he spoke, for even in this involuntary disingenuousness he recognized with shame the first evidence of his dishonour.

"You must have found the way rather a tedious one, Sir Bansaku," replied Goyemon, "if it had no object but to visit an old acquaintance."

The comptroller started at the discourteous rebuke these words implied, but already well accustomed to his host's insuavity, he replied quietly:—

"My object, if successful, would well warrant these and even greater pains, for I come to renew my old offers, this time, however, on no uncertain basis, but with the authority of the Prime Minister himself; and I assure you it would give me the greatest pleasure to see you attached to a service where you could not fail to distinguish yourself."

"Sir Bansaku," answered Goyemon taking little trouble to conceal his impatience, "your kind motives demand my thanks, but I have not altered my resolution of remaining independent. I refused your offers when they simply pointed to the career of a gentleman, and I am still less disposed to accept them now with the adjunct of I know not what hidden purpose, for it can be no commonplace motive that induces the Prime Minister to exchange his claims to be sought, for the chances of a seeker. I am surprised that believing me so credulous you think me worth soliciting."

He was certainly a difficult and ungracious subject, this Ishikawa. So harsh and selfish, that he excluded instinctively every element of sentiment or geniality from his calculations, and saw all the world shaping its course by the same unscrupulous, egotistical creed as himself. Bansaku felt that the seed of his past kindnesses hardly deserved to bear such ungrateful fruit, but this momentary feeling of umbrage had no expression, for the consciousness of a criminal purpose often renders the most independent natures obsequious.

"Whatever else may change, Ishikawa," he said, smiling. "Your nature will always be the same. To speak plainly, however, I have not come with any offers of ordinary service. There is no man, great or small, just or evil, who has not at some time cherished some hope apparently hopeless, and if many die without achievement, it is because they have let slip their one opportunity of achieving. We, on our side, have a service to ask and you, on yours, have no doubt a wish to gratify. The accomplishment of the service is, I know, within your capabilities, and the satisfaction of the wish can hardly exceed the Prime Minister's powers. This is the exchange I propose to you.

Goyemon looked at his visitor with an astonishment that men did not often see him display.

"My answer shall be even clearer than your proposal, Sir Bansaku," he replied. "The first nobleman in Japan, His Majesty's Prime Minister, sends a nobleman, his chief

comptroller, at the dead of night with only one attendant, to search out and satisfy the hypothetical desires of one Ishikawa Goyemon, a nameless commoner. What is the conclusion to be drawn from this marvel? That you have need of my life. You cannot wish to purchase the services of my sword, the times being peaceful, nor yet the services of my secret art, for it has already been imparted to you. So be it then; Sir Bansaku. I am content to barter my life, but I reserve my discretion till you have explained your conditions."

"You look a little beyond the truth, Ishikawa," answered Bansaku. "My version of the position is simply this. The will of a superior has two methods of expression: the first, a command enforced by a penalty, the second a promise supplemented by a request. When such an one as the Prime Minister condescends to adopt the latter course, it becomes necessary to provide against every possibility of refusal, and this necessity rather than the nature of the service we seek, induces us to offer so much. To be candid, Ishikawa," continued the comptroller with an air of good faith that could not fail to convince, "we cannot possibly solicit your acquiescence till after you have obtained ours. It can cost you nothing to explain your wishes, so long as they are honourable; while on the contrary, mortification and indignity may be the result of a premature confidence on our part."

"You are right, Sir Bansaku," said Goyemon after a moment's reflection: "right both in your reasons and in your conjectures, for I have a wish, and strange an one as it may seem, neither its statement nor its refusal will cost me a particle of discomposure. I desire to be appointed to some office at the Imperial Court, not inferior to that which the Prime Minister himself once held. * Ready money or revenues, estates or titles are matters of complete indifference to me."

The purport of these words no less that the tone in which they were pronounced, induced the comptroller at first to believe that Ishikawa had merely enunciated some random extravagance of his fancy, with the design of preventing any further negotiation. But a closer scrutiny convinced him that however irrational, his host's proposition had certainly been advanced in good faith.

"Surely, Ishikawa," he remonstrated, "you cannot seriously have conceived an ambition so utterly at variance with every rule of precedent or promotion. We have indeed no lack of men who 'from the mud have risen above the clouds,' but never at a single leap. There has always been some gradation, some reasonable order of progress. Is it possible to believe that a result so suddenly reached would be either permanent or tolerated?"

Ishikawa laughed heartily at the comptroller's bewilderment. "I ought perhaps to tell you, Sir Bansaku," he said, "that ambition, so called, has nothing to do with this wish of mine. Certainly I should not be sorry to see the edict that degraded my ancestor, Sir Sayemon, revoked, but for myself I only desire the privilege of access to the Emperor's palace, and that with the sole object of obtaining the hand of one of the twelve Maids of Honour. This is my one and only desire, and it has so long tenanted my heart that its accomplishment alone can expel it. Such as you see me, I am not without means, ample means, to gratify my most luxurious fancies, but the possession of a Maid of Honour is the fastidious limit I long to reach. Grant me this, and the Prime Minister may dispose of me afterwards as he pleases."

It was now Bansaku's turn to laugh. He clapped his hands merrily, delighted to find a vulnerable point in Goyemon's intractability. Viewed from this aspect, the proposition seemed much less startling, and certainly comprised nothing that exceeded the Prime Minister's power.

"Now that you tell me your wish," he said, "I am surprised at not having penetrated it before. A mind that has never been constrained to obey anything but the phantasies of its own creation, may well have shaped itself such a romantic ambition as the possession of the pearl of womanhood. It will however be no easy matter, Ishikawa, the consummation of this wish of yours, but I think I can promise you success, provided you achieve the service we have in view. Meantime I will ask you to accompany me to my house, and remain there till I have obtained the Minister's consent, after which I will explain the nature of His Excellency's commission."

* *Chimagon*, or Censor.

"Fulfill my condition, Sir Bansaku, and you may order me to China or India, or dispose of me in any way you please," said Goyemon stoutly, and the two men took their way to the comptroller's house.

(To be continued in our next.)

THE JAPANESE PRESS.

WHAT WOULD BE THE EFFECT ON OUR TRADE IF WAR WERE TO BREAK OUT BETWEEN ENGLAND AND RUSSIA?

LET our readers took at the recent telegrams from Europe. The disputes between England and Russia have reached a most serious point: and in the event of war, Austria would certainly assist England in attacking Russia; and though France and Germany may diligently strive to maintain neutrality; still it is not probable that they could, for long, remain idly looking on, and should they take either side, there would then eventuate a general European war, and indeed a great confusion of the whole world. Even though France, Germany and other countries were able to remain neutral, still—if England and Russia began to fight, it might still be said that, as regards trade, the whole world would be thrown into confusion. And why? Because the means of transportation, of the greatest importance to all foreign trade, would be lost. Englishmen have said that: 'if their merchant-vessels ceased to navigate, the trade of the whole world would be almost stopped.' Although these are, of course, vaunting words, still—as the English possess nine-tenths of the merchant-ships of the world,—as we are well aware, we cannot absolutely say that they are wrong.

But as soon as war is declared, as it cannot be known where the Russian men-of-war may be sailing, Insurance Companies would not make contracts for marine insurance on English merchant-ships, and thus no one will dare to send goods by them, which would, at last, put a stop to all navigation; for, as it would be impossible to know the decision of France, Germany, &c., respecting the quarrel, only very small quantities of goods would be sent in vessels belonging to those countries. And if mercantile communities are thus deprived of the means of transporting their merchandise, it is not unreasonable to say that the whole world would feel the pressure of difficulty.

If we then look at the effect of the breaking out of war upon currency, we see that mining works would be stopped, mints would be closed, and the rich, having no means of employment for their money, would finally hasten to deposit it in trustworthy Banks, and remain idle, with their hands in their pockets. Actually, the total amount of deposits in the Bank of England on the 16th of last January was £29,838,282 whilst on the 17th October last, it was £25,777,135. Comparison of these figures will show an increase in the deposits of £4,000,000, which has probably arisen from the depression in the London markets from the disturbed state of Europe. It is impossible to estimate to how many millions of pounds would amount the expenditure of England, Austria and Russia, in case of war, and by whom would it be paid? Englishmen would pay for the expenditure of their own Government, and even Austria's expenses would probably be paid by England, as we have the proof of this having been done by her, during her war with France many years ago. And that Russia would also seek for the loan of money from Englishmen is also very well known. And as war expenditure is incurred only for gunpowder, arms, coal, provisions for soldiers &c., it cannot be said to assist circulation of money among the people. Therefore we say that on the question of currency merely, the Anglo-Russian war would not a little obstruct the circulation of money throughout the world.

Although there are besides these, so many ways in which the war will affect trade, that we have not enough space to treat of them here, the above-named two suffice to prove that mercantile communities are justified in considering a war between these two nations as a great war affecting all the world. But the state of trade all over the world will doubtless undergo a change so great that it is beyond the depth of our shallow ability to estimate it; and we therefore leave that question for the present, confining our selves to the immediate effects of war upon trade in our own

country, and leave them for the consideration of our readers, watching, ourselves, the actual course of future events.

Silk which is one of the most important of our exports, would not only at once fall in value; but, finally, its export would be entirely stopped: and tea, being hitherto exported mainly to meet the American demand, though it may not feel any considerable effects at once, as silk would; still it cannot escape them to a certain extent, and would suffer in unison with the general depression of trade. And besides, as all the tea hitherto exported from China to England and Russia would be together concentrated in one market, that of America; then there is no doubt that our exports would fall off and decrease in value. And the only exports from our country to Europe for which there is likely to be any increased demand would be rice and corn: but if all transport by sea is stopped, as above stated, we shall have no means to export them, no matter what rise may take place in current prices. So after all, there will be no active traffic in any of our exports.

Turning now to imports, we see that the amount of these must be decreased through the decrease of manufacture in England—and specially by the stoppage of transportation—and as muslins, yarns &c. are mostly of English make, the stocks will at once become insufficient to meet our demands, and prices in Yokohama and other places will rise excessively, and the value of the Mexican dollar will gradually go up in consequence. If we consider all these things, we shall see that our trade will certainly be not a little affected. As however, we merchants sometimes obtain unusual profits by seizing the opportunities which occur according to circumstances, results will depend, to some extent, upon the wisdom of the parties concerned. So, therefore, if we only consider the effect of this war upon our trade as affecting individuals only, there is no cause for alarm; still, if we look at it as affecting the whole public generally, it is very fearful and we earnestly wish for ourselves and our readers together that this great calamity may be avoided, or that—if this be impossible, that we may be prepared for it when it comes.

JAPANESE DRESS FOR THE JAPANESE.

(From the 'Hochi Shimbun'.)

WE lately published an article upon "abandoning the use of leathern boots by soldiers and replacing them with straw shoes," a subject which our readers will we believe, have understood—and now following up the same subject, we wish to extend the argument to others than soldiers.

The Notification dated the 18th September last year was to the effect that all the Government officials may, in the case of wearing the ordinary ceremony dress (swallow-tail coats), wear instead of these, frock-coats of the colour of black or dark blue, and also that officers from the rank of Hannin downwards, may, at the choice of the chief of the department, substitute for them the *Haori* (Japanese coat) and *Hakama* (Japanese loose trowsers).—

There were some at the time who argued that, "whether our Government's adopting Western dress, is on account of convenience or of appearance, it would not be without reason, indeed the employment of such a dress as the 'swallow-tail' on ceremonial occasions would have the effect of bringing the people nearer to Western civilization, at least in appearance. But should the *Haori* and *Hakama* now be permitted to be worn instead of the swallow-tailed coat, this would indeed be a retrograde step of the people from a state of civilization. That this matter of deciding the kind of ceremony dress is now very important, as it will affect the future customs of Japan; and if old fashioned people, mistaking this Notification, are so misguided as to object to abandon the old and take up the new government fashion, this cannot fail to prevent the people getting civilized in their surface appearance."

This argument may be looked upon as stupid words expressed by those who are too fond of Western customs and who grumble without knowing the circumstances of the time and should not be taken notice of. But that the people, from loving ease too much, should lose their manners and fall into the savage state, is what we are afraid of. Etiquette and ceremony are quite indispensable things

for mankind, but there is no reason that these cannot be performed unless in Western dress. If there are Japanese dresses suitable for etiquette and ceremony and not ugly in appearance, it is as convenient for us to employ these. The reason of our Government's permitting the officers of the *Hannin* rank and downwards to employ the *Haori* and *Hakama*, cannot be any other but this.

This action of the Government is, we have no doubt, for the purpose of obviating trouble and promoting convenience. But although the object of the Government may simply be to promote convenience, it seems to us also to have the good effect of promoting economy and making the people rich. We therefore earnestly request that an addition may be made to this Notification, to the effect that the system be extended on a larger scale and thus increase the benefit of the people.

Look at the Japanese fashions in other things: the houses and furniture agree with the usual dress of the people. If we had the Western style of house to suit the Western ceremonial dress, we might wear it accordingly; but if it is to be worn in Japanese houses, the inconvenience is very great; and this is another reason for allowing the officers in and below the rank of *Hannin* to employ either dress for the present.

We however observe from the order of the Naimusho (home affairs department) in reply to an enquiry from the Wakayama Ken, that this convenient system only refers to officers actually and nominally in and below the rank of *Hannin* and any others who are in the temporary employment and that it does not refer to the people at large. Thus the public are obliged to wear the swallow-tail dresses and cannot employ the *Haori* and *Hakama* in their stead.

The ceremonial dresses of the Government officers are chiefly worn in the Government offices, whilst those of citizens are chiefly worn in their private houses, and whilst the Government offices and their furniture being mostly of the Western style, the dresses of the same style may be employed, yet the convenience of wearing the *Haori* and *Hakama* instead has been granted to these. Why cannot citizens who have the least connection with Western matters, be allowed to adopt the same? In performing ceremonials and the duties of etiquette in Japanese houses, the swallow-tail dress is very inconvenient and the *Asagami-shimo* (Japanese ceremonial dress in the old time) is not genteel and the only dress that is suitable therefore is the *Haori* and *Hakama*. So if the substitution of these for the swallow-tail coats were allowed publicly, it would not only be a convenience to the people, but would diminish the expenses of dressing in Western materials and consequently buying other Western goods which are necessary to suit the dress.

Indeed if the people throughout the country were allowed to employ ceremonial dresses of the kind above referred to, it would not only promote their comfort but would enable them to lessen a portion of the foreign imports.

Convenience and general benefit being as above stated, thus on our side, we earnestly request that this system be extended more widely.

Further, the Notification says that the rule may be put in force at the will of the chiefs of the departments, &c., &c., &c. From this it would appear that the employment or non-employment of swallow-tail coats entirely depends upon the will of the chiefs and if they are in favour of the Western fashion, the officers in the department could not adopt this convenient system.

Should this really be the case, it cannot operate in the direction of promoting general convenience. If the employment of both dresses at option has already been granted to certain parties, it is better, indeed necessary to extend the system on a larger scale. We are therefore of opinion, that if, instead of putting any limit to the adoption of the system, all officers, either * *Sonin* or *Hannin* and also citizens were permitted to substitute native ceremony dress for swallow-tail coats and to wear the *Montsuki haori* (Japanese coat with crest on the back) and *Machitaka*

* The Government officers in Japan are grouped into seventeen grades. From the 1st to the 3rd class are called *Chokunin*; from the 4th to the 7th, *Sonin*; and from the 8th to the 17th, *Hannin*.

hakama (Japanese loose trousers) it would certainly without affecting etiquette and ceremony, greatly promote convenience and general benefit.

EXTRATS.

FURTHER EXPERIENCE AS AN EDITOR OF MR. GILEAD P. BECK.

(From the 'Golden Butterfly'.)

"I don't know whether you visited Illinois when you were in America, Mr. Dunquerque; but if you did, perhaps you went to Clearville. It is in that part of the State which goes by the name of Egypt, and is so named on account of the benighted condition of the natives. It wasn't a lively place to go to, but still—

"The *Clearville Roarer* was the property of a Mrs. Scrimmager, widow of the lately defunct editor. She was a fresh buxom widow of thirty-five, with a flow of language that would drown a town-council or a vestry. I inferred from this that the late Mr. Scrimmager was not probably very sorry when the time came for him to pass in his checks.

"She occupied the upper flats of a large square building, in the lower part of which were the offices of the paper. I inspected the premises, and having found that the books and plant were pretty well what the advertisement pretended, I closed the bargain at once, and entered into possession.

"The first evening I took tea with Mrs. Scrimmager.

"It must be more than a mite lonely for you," she said, as we sat over her dough-nuts and flipflaps, 'up at the tavern. But you'll soon get to know all the leading people. They're a two-cent lot, the best of them. Scrimmy (we always called him Scrimmy for short) never cottoned to them. He used to say they were too low and common, mean enough to shoot a man without giving him a chance—a thing which Scrimmy, who was honourable from his boots up, would have scorned to do.'

"I asked if it was long since her husband had taken his departure.

"He started," she said, 'for kingdom come two months ago, if that's what you mean.'

"Long ill?"

"Ill?" she replied, as if surprised at the question. 'Scrimmy never was ill in his life. He was quite the wrong sort of stuff for that. Scrimmy was killed.'

"Was he?" I asked. 'Railway accident, I suppose?'

"Mrs. Scrimmager looked at me resentfully, as if she thought I really ought to have known better. Then she curved her upper lip in disdain.

"Railway accident! Not much. Scrimmy was shot.'

"Terrible!" I ejaculated, with a nervous sensation, because I guessed what was coming:

"Well, it was rough on him," she said. 'Scrimmy and Huggins of the *Scalper*—do you know Huggins? Well, you'll meet him soon enough for your health. They hadn't been friends for a long while, and each man was waiting to draw a bead on the other. How they did go for one another! As an ink-slinger, Huggins wasn't a patch on my husband; but Huggins was a trifle handier with his irons. In fact, Huggins has shot enough men to make a small graveyard of his own; and his special weakness is editors of your paper.'

"I began to think that Clearville was not altogether the place for peace and rest. But it was too late now.

"The lady went on:

"Finally, Scrimmy wrote something that riled Huggins awful. So he sent him a civil note, saying that he'd bore a hole in him first chance. I've got the note in my desk there. That was gentlemanlike, so far; but he spoiled it all by the mean sneaking way he carried it through. Scrimmy, who was wonderful careless and never would take my advice, was writing in his office when Huggins crept in quiet, and dropped a bullet through his neck before he had time to turn. Scrimmy knew it was all up; but he was game to the last, and finished his article, giving the *Scalper* thunder. When he'd done it he came up-stairs and died.'

"And Mr. Huggins?"

"They tried him; but, Lord, the jury were all his friends, and they brought it in justifiable homicide. After the funeral, Huggins behaved handsome; he put the *Scalper* into deep mourning, and wrote a beautiful send-off notice, saying what a loss the community had suffered in Scrimmy's untimely end. I've got the article in my desk, and I'll show it to you; but somehow I never could bring myself to be friends with Huggins after it.'

"Mr. Scrimmager was perhaps not the only editor who has fallen a victim in Clearville.'

"The only one? Not by a long chalk," she replied. "The *Roarer* has had six editors in five years; they've all been shot except one, and he died of consumption. His was a very sad case. A deputation of leading citizens called to interview him one evening; he took refuge on the roof of the office, and they kept him there all night in a storm. He died in two months after it. But he was a poor nervous critter, quite unfit for his position."

"And this," I thought, "this is the place I have chosen for a quiet life."

"I debated that night with myself whether it would be better to blow the roof off my head at once, instead of waiting for Huggins or some other citizen to do it for me. But I resolved on waiting a little."

"Next day I examined the files of the *Roarer*, and found that it had been edited with great vigour and force; there was gunpowder in every article, fire and brimstone in every paragraph. No wonder, I thought, that the men who wrote those things were chopped up into sausage-meat. I read more, and it seemed as if they might as well have set themselves up as targets at once. I determined on changing the tone of the paper; I would no longer call people midnight assassins and highway robbers, nor would I hint that political opponents were all related to suspended criminals. I would make the *Roarer* something pure, noble, and good; I would take Washington Irving for my model; it should be my mission to elevate the people."

"Wal, sir, I began. I wrote for my first number articles as elevating as Kentucky whisky. Every sentence was richly turned; every paragraph was as gentle as if from the pen of Goldsmith. There was a mutiny among the compositors; they were unaccustomed to such language, and it made them feel small. One man, after swearing till the atmosphere was blue, laid down his stick in despair and went and got drunk. And the two apprentices fought over the meaning of a sentence in the back-yard. One of those boys is now a cripple for life."

"It would have been better for me, a thousand times better, if I had stuck to the old lines of writing. The people were accustomed to that. They looked for it, and they didn't want any elevating. If you think of it, Mr. Dunquerque, people never do. The Clearville roughs liked to be abused, too, because it gave them prominence and importance. But my pure style didn't suit them, and, as it turned out, didn't suit me either."

"The City Marshal was the earliest visitor after the issue of my first number. He came to say that, as the chief executive officer of the town, he would not be responsible for the public peace if I persevered in that inflammatory style. I told him I wouldn't change it for him or anybody else. Then he said it would cause a riot, and he washed his hands of it, and he'd done his duty."

"Next came the Mayor with two town-councillors."

"What, in thunder, do you think you mean, young man," his honour began, pointing to my last editorial, "by bringing everlasting disgrace on our town with such mush as that?"

"He called it mush."

"I asked him what was wrong in it."

"Wrong? It is all wrong. Of all the mean and miserable twaddle—"

"He called it miserable twaddle."

"Hold on, Mr. Mayor," I said; "we must discuss this article in a different way. Which member of your august body does the heavy business?"

"We all take a hand when it's serious," he replied; "but in ordinary cases it's generally understood that I do the municipal fighting myself."

"We'll consider this an ordinary case, Mr. Mayor," I said; and I went for that chief magistrate. He presently passed through the window—the fight had no details of interest—and then the town-councillors shook hands with me, congratulated me on my editorial, and walked out quiet through the door."

"Nearly a dozen Egyptians dropped in during the afternoon to remonstrate. I disposed of them in as gentlemanlike a manner as possible. Towards evening I was growing a little tired, and thinking of shutting up for the day, when my foreman, whom the day's proceedings had made young again—such is the effect of joy—informed me that Mr. Huggins of the *Scalper* was coming down the street. A moment later Mr. Huggins entered. He was a medium-sized man, with sharp, piercing eyes and a well-bronzed face, active as a terrier and tough as a hickory-knot. I was sitting in the wreck of the office-desk, but I rose as he came in."

"Don't stir," he said pleasantly. "My name is Huggins; but I am not going to kill you to-day."

"I said I was much obliged to him."

"I see you've been receiving visitors," he went on, looking at the fragments of the chairs. "Ours, Mr. Beck, is an active and a responsible profession."

"I said I thought it was."

"These people have been pressing their arguments home with unseemly haste," he said. "It is unkind to treat a stranger thus. Now as for me, I wouldn't draw on you for your first article, not to be made Governor of Illinois. It would be most unprofessional. Give a man a fair show, I say."

"Very good, Mr. Huggins."

"At the same time, Mr. Beck, I do think you've laid yourself open. You are reckless, not to say insulting. Take my case. You never saw me before, and you've had the weakness to speak of me as the gentlemanly editor of the *Scalper*."

"I'm sure, Mr. Huggins, if the term is offensive—"

"Offensive? Of course it is offensive. But as this is our first interview, I must not let my dander rise."

"Let it rise by all means, and stay as high as it likes. We may find a way of bringing it down again."

"No, no," he answered, smiling; "it would be unprofessional. Still, I must say that your sneaking, snivelling city way of speaking will not go down, and I have looked in to tell you that it must not be repeated."

"It shall not be repeated, Mr. Huggins. I shall never again make the mistake of calling you a gentleman."

"He started up like a flash, and moved his hand to his breast-pocket:—"

"What do you mean by that?"

"I was just in time, as I sprang upon and seized him by both arms before he could draw his pistol."

"I mean this," I said: "you've waked up the wrong passenger this time, Mr. Huggins. You needn't wriggle. I've been chucking people through that window all day, and you shall end the lot. But first I want that shooting-iron; it might go off by accident and hurt some one badly."

"It was a long and mighty heavy contract, for he was as supple as an eel and as wicked as a cat. But I got the best hold at last, relieved him of his pistol, and tossed him through the window."

"Jim," I said to the foreman, as I stretched myself in a corner, panting and bleeding, "you can shut up. We shan't do any more business to-day."

"I issued two more numbers of the *Roarer* on the same refined and gentlemanly principle, and I fought half the county. But all to no purpose. Neither fighting nor writing could reform those Egyptians."

"Huggins shot me through the arm one evening as I was going home from the office. I shall carry his mark to the grave. Three nights later I was waited on by about thirty leading citizens, headed by the Mayor. They said they thought Clearville wasn't agreeing with me, and they were come to remove me. I was removed on a plank, escorted by a torchlight process of the local fire-brigade. On the platform of the railway-station the Mayor delivered a short address. He said, with tears, that the interests of party were above those of individuals, and that a change of residence was necessary for me. Then he put into my hands a purse with two hundred dollars, and we parted with every expression of mutual esteem."

"That is how I came out of the land of Egypt, Mr. Dunquerque; and that is the whole history of my connection with the press."

DEATH OF DR. A. DUFF.

[The *Madras Athenaeum* writes thus of this eminent Missionary, whose death we mentioned a fortnight ago:—]

"Few, very few are those who can remember the day when Dr. Duff landed in Calcutta, after having been nearly shipwrecked on his way out. Dr. Duff's career, both in this country, and, after his going home, in Scotland, has been a most remarkable one. We have no hesitation in saying that he has been the greatest missionary educationalist (Dr. Wilson of Bombay scarcely excepted) which India has ever known. His Free Church of Scotland brethren in Madras will deeply feel his loss; and we shall be surprised if from many of their pulpits in this presidency, do not echo next Sunday grateful acknowledgments of his eminent services. Even when he had been obliged to retire from active Missionary work in India, he remembered his old sphere of labour, and a large number of the foremost Free Church educationalists in India to-day have been continually supported in their work here by his advice and encouragement. We may mention in passing, a somewhat strange fact. Bishop CALDWELL, of the South of this Presidency, was we believe, a fellow-student with Dr. Duff, in Scotland, when Dr. CALDWELL was himself a member of the Scotch Free Church, and had not sought Holy Orders in the Church of England. Excepting Bishop CALDWELL, few Missionaries at present in India remember much of the earliest vigour and fervid intensity of Dr. Duff's work. His heart and his soul, from his first day in India, was in the work of attempting to grasp the young Hindu and Mussalman mind, and, in its tender growth, to purify, enlighten, and raise it for Christ. Dr. Duff in his early years was a wonderfully fluent and florid speaker. He carried much before

him by sheer force of his tongue. But as he grew old, his style, always attractive, became less florid and more chastely ornate. We hope that his biography will be published. His name is too identified with the Missionary causes in India to be lost sight of. He was a D. D. and L. L. D. as only Bishop CALDWELL, his old College friend is now in India.

Dr. DUFF was born near Pitlochry, Perthshire, in 1806, studied at the University of St. Andrews, where he graduated in honours; and at College was remarkable for the great interest which he displayed in the cause of missions to heathen lands. Early in 1829 the offer was made to him to undertake the important office of the first missionary to India from the Established Church of Scotland, and having accepted it, he was ordained by the Presbytery of Edinburgh, and sailed from Portsmouth for India about the middle of October, in the *Lady Holland*, East Indiaman, which was wrecked on Dassen Island, near the Cape of Good Hope, Feb. 13, 1830; but the Rev. A. Duff eventually reached his destination in safety. The institution which he founded there in 1830 has long been the largest in India, and at this establishment, in addition to elementary instruction, the higher branches of literature, science, philosophy, and Christian theology are taught. In 1843 he joined that section of the clergy which seceded from the Church of Scotland and by his untiring energy and zeal, and personal influence, was enabled to carry on successfully the missionary work at Calcutta, in connection with the Free Church. On revisiting his native land for the first time in 1836, his efforts to diffuse a missionary spirit throughout the churches were unremitting. Having returned to Scotland a second time in 1850, he was chosen Moderator of the General Assembly of the Free Church in 1851, was examined before a Committee of the House of Lords in Indian affairs in 1853, and contributed valuable materials for the famous Education Despatch of 1854. He has written, among other works, "New Era for the English Language and Literature in India," published at Edinburgh in 1837; "India and India Missions," in 1839, containing the substance of his addresses on different occasions, both from the platform and the pulpit, in England and Scotland, on the subject of India Missions; "Missions the chief end of the Christian Church," the "Qualifications, Duties, and Trials of an Indian Missionary," in 1839; "Letters on the Indian Rebellion" 1858; various articles in the *Calcutta Review*, of which he was at its commencement, and for several years, editor; and many pamphlets on miscellaneous subjects. Dr. Duff, in consequence of ill health, was constrained to quit India in Dec., 1863, after more than thirty years of missionary labour. After his return he was appointed Convenor or Permanent President of the Free Church. As the result of his suggestion and earnest pleading, a new professorship of evangelistic theology was established by the General Assembly in its theological colleges, while, through his personal exertions, the sum of £10,000 was raised and invested for its endowment. Having been unanimously called by the church at large to accept the first appointment to the new collegiate chair, he responded to the call on the express condition that the salary attached to the office should be applied to another object of a missionary character, and that "any services which he could render should be purely and absolutely gratuitous."

.. The dates of Arrival and Departure of the Mitsu Bishi Company's steamers are susceptible of alteration, consequent on the necessity imposed upon the Company—by its contract—of connecting with the steamers of the Pacific Mail.

.. No days for Arrival or Departure of the Pacific Mail Company's or Occidental and Oriental Company's steamers having as yet been fixed, we are unable to tabulate them. Each separate steamer's departure from her port will be notified in the Table below, and the day of her probable arrival at her destination.

.. Three days are allowed in the P. & O. Company's Schedule for transit of the Mails between London and Brindisi.

.. Two days are allowed in the Messageries Company's Schedule for transit of the Mails between London and Marseilles.

SCHOOL FOR CHILDREN IN SWITZERLAND.

MADAME A. JAQUEMOT (née Dogny) proposes to establish at Geneva, Switzerland, a Boarding School for Girls, and for Boys under 12 years of age; where they will have the advantages of a sound education and sedulous domestic care.

Boys over 12 years of age may be committed to Madame Jaquemot's charge as boarders, and parents can thus secure for them the comforts of a home, with the opportunity of attending one or other of those educational establishments for which Geneva is so justly celebrated.

Parents wishful to place children under her charge at the Pension Dogny, may address their enquiries as to terms &c. to the Editor of the *Japan Times*, who is empowered to furnish them.

TEA.

MORE than once since the establishment of this Review, have we deprecated the intention of Japanese tea-growers to attempt, this season, the production of what they propose to call 'black' Tea. A writer in a native newspaper, whose article we translate to-day, follows the line we traced in our first number for the guidance of dealers in silk worms' eggs, and—while, in general terms and very properly, objecting to governmental interference with trade—calls on the rulers of the people to protect them against their own proved folly of over-production of silk seed. There is still time for this or some other patriot, to protest in even stronger terms against those engaged in an equally important branch of Japanese Commerce committing commercial suicide—this time urged to the act by a Government Notification.

We lately devoted a certain amount of time and labour to the exposition of the truth,—acknowledged by commercial communities rich in the experience of more years of successful trade than merchants or Ministers in Japan can count weeks,—that, as a rule, all Governmental interference with trade is bad. Trade should be left entirely free; traders will find out their mistakes, and correct them, for themselves. But the Press should also be free, and then newspapers, specially devoted to the service of commerce, will be able to warn and direct, by argument, record, statistics. But in a country like this, destitute of accumulated wealth of capital; with a commercial community and a Government alike destitute of accumulated wealth of knowledge and experience; with its native press heavily fettered, and foreign publicists, who could and would help them, completely muzzled, Government should be especially cautious in its interference with its merchant subjects. Were this Government composed of men like those who ruled the destinies of the great trading Republics of the Middle Ages—such as Venice, Genoa, the United Netherlands—heirs of the experience and practice of generations of merchants—it might be trusted to dictate to the people in what directions their energies might be best directed. But in Japan there are no Medicis, Dorias, or Fuggers, and we see, at the actual moment, a Minister of Commerce refusing to profit by some years' experience in one of the two great divisions of the export trade—abstaining from the slightest word of warning against over-production of silk-worms' eggs, which has already resulted in one enormous loss,—while he dictates orders to those engaged in the other—the tea-trade—to make an experiment which, in the opinion of almost every foreign expert, is certain to lead to another.

In other columns is carefully reprinted an extract from the "Shipping and Commercial List and New York Price Current", a most valuable and reliable Trade Journal, headed "The Tea Trade of the Port of New York, for the year ending December 31, 1877." We believe that but one

or two copies of this exhaustive review of the Tea Trade of the United States have reached Yokohama, and our foreign readers will probably thank us for placing it within their reach. But it is with the hope that it will be studied by Japanese engaged in the Tea trade, and to serve as text and support for the few remarks we have ourselves to make to-day, that we are chiefly impelled to quote it. We are on the threshold of another Tea season, and surely, natives and foreigners alike, we may wisely pause before crossing it, and carefully study the condition of our only market for the leaf. If the native government and native tea-growers are not induced by the facts and figures which that market offers for their guidance—as reflected in this able and trustworthy report, to abandon the attempt to make "black" tea—this journal, for one, will not again offer advice on the subject; for the rôle of wisdom that "crieth aloud in the streets and no man regardeth her" is not one which we have any ambition to fill;—and, if our arguments do not convince our native friends,— "neither would they believe, though one rose from the dead."

The special value of the Report which we quote, and of the tabular statements it includes, lies in the comparisons which it enables us to make between the relative positions, increase or decrease of imports, stocks and consumptions, of the various classes of Teas on the American Continent. It includes the figures and statistics relative to China Teas, as well as to Japans, and thus gives us all the information we require for record or for forecast. The tables show considerable increases in several descriptions, most remarkable in Blacks and Oolongs, which in round figures show an increase of nine-and-a-half million pounds, in comparison with the preceding year, 1876. Green Teas remain nearly stationary, being about half-a-million pounds under the preceding year's Import, and Japans shew an increase of about one-and-a-half millions. The principal feature of interest in this extract is to be found in the Report on "Oo-longs," especially those from Formosa. To this point we would crave the marked attention of our Japanese friends. The islands of Japan assimilate much more closely in climate and position to Formosa, than to the continental country of China. Surrounded by seas, it is natural that Formosa should enjoy a much more humid atmosphere than the provinces whence come the principal supplies of Black Teas; and hence the difference between the heavy, full liquor of the "Congou Tea," in comparison with the aromatic fragrance of the "Formosa Oolong," delicate and rather "light" in the cup, but still well suited to the palate of the American consumer, as is clearly shewn by its increasing popularity, the figures of Import for the two years standing 8,157,603 lbs for 1877, against 3,790,831 lbs for 1876. We are inclined fully to endorse the prediction of the writer in the *Shipping and Commercial List*, that 'if its present standard of excellence be maintained,' its consumption in the United States 'will increase in about the ratio of the increment of production.' This Tea is pre-

pared in Formosa to about the same stage that "Native Cured Teas" are here, but by a somewhat different process, and is shipped from Tamsui to Amoy, where in former years, it was repacked by foreign houses and shipped to their port of destination.

But Chinese are no more exempt from the follies of mortality than are the natives of Japan; and seeing that the "barbarian" packer was making fair profits in that line, they determined to enter the field and sell him ready packed Teas. This was tried last season, but the result will hardly warrant the repetition of the experiment, as the native venturers were losers of fully \$150,000 in the operations in Tamsui. Tea-growers in this country should carefully verify this statement, which they will have no difficulty in doing, by reference to any of their foreign friends in the trade, whose welfare and profit are intimately bound up with their own; and who, their interest lying so certainly in the direction of helping them to a fair profit, would as certainly grudge them no information which would prevent them making a ruinous loss by any similar piece of folly.

If Japanese teagrowers are dissatisfied with the existing position of their leaf, and must make experiments with it, this is what we would advise them to do. Instead of attempting to make black tea, to imitate a product for which their leaf lacks the necessary initial qualifications, let them cure the leaf of some of their provinces, notably Surunga and Esai, in a manner somewhat to the style in which the Formosa Teas are prepared up-country, and Teas so pre-

pared could then receive their finishing touches at this port.

The first Crop of Formosa Oolongs last season were much complained of at Amoy, as they lacked strength and pungency. These had been principally fired and packed by native merchants, but the result was far from satisfactory and entailed heavy losses on the operators. This is another point which our Japanese friends ought most carefully to note. They may be able to fire teas perfectly well to suit the taste of their own countrymen, but it is impossible that they can know, as we do, how the leaf requires to be treated to prepare it for a foreign market, and they are sure to find the results more satisfactory all round, if they will divide the labour—grow and pick and bring down tea themselves, and leave it to us to fire, pack and ship the finished article.

We should like, also, we may conclude by saying, to see the Japanese a little less eager to make these costly experiments. It is true that success cannot be obtained without much labour, and often some loss. But success might be attained as quickly, while loss might be greatly reduced, if they would feel their way gradually, instead of launching out suddenly into ambitious schemes for the extensive production of Congou Teas, the result of which may prove little less disastrous than did the attempt to produce uncoloured Japan Teas "suitable for the American markets," the result of which showed a loss of \$120,000 to \$130,000, against the probable amount the same Teas would have realised in Yokohama, sold here in their un-fired state.

THE preceding statistics show an apparent increase in the aggregate consumption of Tea in the United States during the year 1877 of 3,878,645 pounds, which is wholly confined to Japan and Black, the former having gained to the extent of 3,643,555 pounds, and the latter 2,521,451 pounds over the quantity used in 1876. On the other hand, the quantity of Green which entered the channels of consumption fell short of that in 1876 by 2,286,361 pounds. The increased distribution of Japan and Black Tea may be ascribed to two leading causes, viz., to the economical tendency of the times, which has unquestionably turned the consumption more largely than usual upon the cheaper kinds, and to the greater uniformity in the quality of these varieties than is found in Green. In fact, Green Tea has shown a continual gradual deterioration in quality, which, with its higher relative cost, is sufficient to explain its decreased consumption. It is worthy of note that those sections of country which were formerly the largest consumers of Green Tea are gradually turning their attention to the low grades of Japan and Black, and this substitution is evidently the result of the paramount considerations of price and reliability of grade, both of which tell directly in favour of the latter article. That this is the correct exegesis seems to be conclusively shown by the fact that the distribution of the high grades of Japan—the price of which assimilates to that of Green and the better sorts of Black—has not kept pace with that of the low grades. With the consumers of Oolong, Formosa continues to be the favorite kind, as shown by the increased export from China, which for the Tea season of 1877-78 has reached nearly eight million pounds, an increase of nearly one hundred per cent. since the season of 1875-76. When we reflect that it is only about seven years since

Formosa Tea, as such, was first introduced into the United States, the increase in its consumption is truly surprising, and may be said to be due to the general excellence and uniformity of its quality, its strength, and the peculiarity of its flavor being adapted to the tastes of Tea drinkers in all sections of the country. Nearly the entire yield of the Island of Formosa is consumed in this country and we hazard little in saying that, if its present standard of excellence shall be maintained, its consumption by our people will increase in about the ratio of the increment of production. And, as to the maintenance of its quality for a long period, there would seem to be no reason for doubt, since the soil of Formosa is not only virgin, but rich and alluvial, whereas the older Tea plantations of China have become so impoverished as to curtail the yield, and, also, to impair the quality. Foo Chow Oolong may be said to have retained its former popularity, but the quantity received has again been small, comprising, as in the previous year, mainly the finest well known strings or chops, to meet an imperative demand; the supposition being that, through the sharp competition of the Formosa product, the Chinese have been constrained to convert a larger percentage of the leaf into Congou and Souehong for the English market. Amoy continues to be the low-priced popular Oolong Tea among the masses, as shown by the stock at the close, which is the smallest for many years, notwithstanding the large quantity imported. The increased favor with which Congou and Souehong Tea was regarded in 1876 appears to have led to an over-importation during the year under review, and while the consumption has not decreased, the result cannot be said to have been satisfactory to the importers, who, in their efforts to work off excessive supplies, have in some cases

forced prices below the point which affords a profit over and above the cost and charges. The depression, however, has been advantageous to consumers, who have been furnished with an excellent article at a popular price. This should and doubtless will, tend to increase consumption of these descriptions, particularly as there has not only been an increase in the consumption of China leaf in England, but also a large importation to that country of Indian Tea. This latter kind has, as yet, only been introduced here in a small experimental way, but, from the rapid increase of its production, it may figure extensively in our statistics in the years to come. It assimilates in appearance and flavor to the finer grades of China Congou.

The state of trade during the greater part of the year has been, if possible, more unsatisfactory than it was during the preceding year. It is but proper to remark, however, that the Tea trade has been no worse than most other branches. All have suffered from the general industrial and commercial depression, which has hung on with perverse persistency, forcing the masses to a self-denial altogether unparalleled during the present generation. The year, too, has been so fraught with business embarrassments and disasters as to seriously impair public confidence, thereby unsettling values and rendering it difficult frequently to get back a new dollar for an old one. In conjunction with these discouragements, the effort to repeal the resumption law, and the schemes before Congress for making debased silver a legal tender for all debts, public and private, have conspired to disappoint the hopes and expectations of a reaction. The advisability of restoring the duty on Tea has again been agitated, but while events have conclusively demonstrated that breakfast tables are no more "free" than they were before its removal, so many conflicting opinions prevail among our law-makers, that there is little probability of a harmonization of views necessary for the restoration of the impost during the present session, albeit there is very little question as to the feasibility of the proposition among business men in general, and the Tea importers and dealers in particular. The excessive competition in this branch of trade, to which incidental reference was made in our last review, continues to be a marked feature, and has tended to complicate and make matters worse. The renowned China and East India merchant seems to be fast becoming a personage of the past, importing dealers and jobbers having to a great extent usurped the functions of the leading men formerly engaged in the trade of the far East. Tea is now furnished direct to the distributing interests of the interior at the expense of the port of New York, the diversion being estimated by some competent judges to have reached thirty-three per cent. And as if still further to contribute to the depression, we have had a succession of unreserved public sales during the greater part of the year, which closed with an increased stock of inferior Tea and an altogether unsatisfactory market. Prices during the year have not been subject to very wide fluctuations. There was a decline during the Summer and early Autumn, but subsequently most of the loss was recovered.

The short routes of transportation have grown in favour, the number of sailing vessels arrived here during the year having decreased from forty-three in 1876 to thirty-three in 1877, whereas the number of steamers, via Suez Canal direct, in 1877 numbered twelve, against eight in 1876, four in 1875, and six in 1874, to say nothing of the receipts via England and San Francisco.

The cargoes brought by steamers are, as a rule, landed in fine condition, at rates of freight not materially higher than was formerly paid to sailing vessels, and as the new crop thus reaches us much earlier, with something saved in the way of interest, it would seem to be only a question of short time, when the entire carriage will be effected by steam.

GREEN.—During January there was quite an active consumptive demand for fine chops Teenkai and Moyune, and, also, considerable speculative inquiry for "old crop," but Pingsueys sold slowly at rather easier prices, the auction sales exerting a depressing influence on values. The demand during February was of a more satisfactory character, and on some of the lower grades a slight advance was realized. The statistical position of the market for Teenkai and Moyune in March was favorable to the holding interests, and a firm disposition was manifested. The low rates for Japan also attracted the attention of buyers to that description. April was a quiet month, and on Young Hysons and Imperial there was a decline equal to two cents gold ¥ lb., other descriptions remaining steady. The auction sales supplied a large percentage of the wants of the Trade during May, and the market at private was in consequence slow, holders being unwilling to meet buyers at the decline established the previous month. Desirable Teenkai and Pingsueys were in moderate demand at auction prices in June. In July, the market eased off 2 @ 3 cents ¥ lb. Holders having determined to meet buyers at auction prices, sales subsequently were made in August at 3 @ 4 cents below the prices obtained in

June. Favorite chops of old crops sold down to 29 cents. A temporary cessation of unreserved auction sales had the effect of improving the tone of the market in September, followed by a better demand with an advance of 2 @ 3 cents on chops of old crop. Business in October, however, was again checked by the announcement of unreserved auction sales. Old crop Teenkai and Moyune declined 1 @ 2 cents ¥ lb., and sales were reported of fine new crop Moyune at 37 cents gold. The resumption of weekly public sales without reserve in November resulted in weaker prices; new crop Pingsueys and Fine to Finest chops old Teenkai and Moyune were taken in liberal quantities, though at lower prices. During December the demand was limited, and prices of the Finest Moyunes, and chops of Medium and Common Pingsueys were held considerably above buyers' views.

JAPAN.—The year opened with an increased demand, promoted by concessions to buyers. Lower grades sold to a moderate extent in February, but prices ruled low. Medium and Common grades attracted some attention through March, but the better qualities were dull and irregular in price. The market was devoid of animation in April, but there was a somewhat better feeling on the higher grades. Invoices averaging not over 25 cents ¥ lb. were in demand in May, but the market was in anything but a favorable condition. The arrival of several parcels new crop in June gave to the market some appearance of activity, and the opening sales were effected at 50 @ 53 cents for Choicest, 45 @ 53 for Choice, and 40 @ 43 for Finest; these prices, however, were not sustained to the close of the month. Good medium grades declined in July to 21 cents, and a large business resulted. During August the market continued to drag heavily, with good Medium new crop offered at 26 @ 27 cents ¥ lb.; prices of old crop, though weak, were not quotably lower. The month of September witnessed a more active demand, partly speculative, for old crop, with firm but not quotably higher prices. Good Medium and grades below, sold fairly at prices previously current. October brought no change. In November, the market was strong for Common to Medium grades at advanced quotations, owing to the light supply offering. The better grades on the other hand were neglected and nominal. For good Medium to Common grades there was considerable inquiry in December, and former quotations were fully sustained, and the market left off strong on light offerings.

BLACK.—January opened with a good demand for most descriptions of Oolong at 24½ @ 25 cents gold for new crop Amoy, and 23 @ 32 for good to superior Formosa. The market was fairly supplied with Congou and Souchong, but at the prices demanded, business was slow. Speculators entered the market in February and purchased quite freely of Oolong, Amoy advancing to 25½ @ 26½ cents gold for fair to good cargoes. In March, speculators operated quite largely in this description, and Formosa also sold well at a slight improvement in prices. Congou and Souchong declined a trifle, with an easier feeling manifest. In April there was a large business consummated, but at lower prices on all common grades; the better qualities were strong at previous prices. During May there was a fair business, and previous current prices were generally maintained. In June there was general decline, which, however, failed to stimulate purchases. In July Formosa Oolong declined 2 @ 3 cents ¥ lb. from the prices current the previous month, and old crop Amoy was saleable only at lower figures. August showed no improvement, and the receipts of new crop Formosa Oolong sold daily at a loss to the importer; the quality, however, of that to hand was considered poorer than previous seasons. Old crop Amoy also sold at lower prices. The receipts of new Congou were pressed for sale, resulting in the realization of extremely low figures. It was during this month that a movement was started among the prominent dealers, as a measure of relief, not to attend auction sales, but it was without favorable result. In September old crop Amoy Oolong, fair to good cargo, sold at 24 cents gold. The new crop Formosa arriving not being in quality up to the ideas of buyers, in consequence bids were much below holders' views. During October Oolong was in fair demand; new crop Amoy, averaging good cargoes to superior, brought 25 @ 26 cents gold; and new crop Formosa, good cargo, 23; the better grades of the latter, however, were somewhat nominal in price owing to the unsatisfactory quality. New crop Amoy and Formosa Oolong attracted most attention in November. In this month good common Congou sold down to 17 cents currency, closing with a dull market and weak prices. The local Trade operated quite freely during December in Oolong, and the small supply was held with firmness. Congou was neglected, notwithstanding the favorable rates they were offered at. The month and the year closed quietly.

[This is virtually the end of the Report, but although many of our readers, uninterested in the tea-trade, may have had enough of it, they must not grudge to those who care more about the subject

than themselves our occupying a few lines of this page by the reprinting of an explanatory table of statistics.]

Decrease in 1877	4,048,978

The *Commercial Herald*, of San Francisco, to which we are indebted for the statistics of that port, says that "the promiscuous branch of importing (by jobbers and dealers) has not, on the whole, been attended with the success anticipated, and must eventually cease to a great extent. Among these latter are some few Oregon houses, and firms in the interior cities of California Utah, &c.

THE COURTS.

WE have, this week, to keep other matter standing over, in order to make room for the second number of our Law Report. As we stated when commencing the series, we do not confine ourselves to the cases of our own local Court; we are ambitious enough to attempt to make our columns a medium for the record of all cases decided by the Supreme Court, which have an important bearing on Eastern trade, or on the position of our fellow residents in the East. To present to our readers such a series of Reports as they may be able to understand; that will give them, with as much conciseness as the matter permits of, a clear idea of the points involved in each case; that will show them alike the guiding principles of the decisions, and the point whence the loser swerved from the narrow lines of law or equity; without wearying them with the jangling of forensic contentions, or the clashings of human depravity,—this is our purpose, and the pages which we dedicate to its accomplishment will, we trust, supply a want which has been for a long time felt. We have often heard mooted the value of a collection, in one series, of the whole of the cases which have been decided, in the local courts of Hongkong, China and Japan, or at home on Appeal. The difficulty of such an undertaking is obvious, the cost of publication would be great and the very limited number of subscribers which could be hoped for would not compensate the producer for the labour and diligence of editing such a series. We thoroughly acknowledge the practical usefulness of such a work: it would save many an hour of weary research to the lawyer, and would save many a heavy fee to the merchant: but we doubt whether any labour in such a cause would be better appreciated than efforts in any

useful work usually are; and unless some distinct encouragement is afforded us, we shall certainly not, ourselves, venture on such a task.

In the case of *Ching Foong v. Lane, Crawford & Co.*, the first noticed in this number, an important principle of commercial law is exemplified; the point is not new, of course, but it has in this case been used to unravel one of the many entanglements which are constantly occurring, in the interpretation of "bought and sold notes." A cargo of Kerosine is purchased "to arrive" in a certain ship, 12,000 cases of 10 gallons each, "damaged cases and leakage to be allowed for;" the cargo arrived in very bad order, all the cases containing the oil being more or less stained, and considerable leakage of the tins having taken place. The purchaser rejected the cargo as unmerchantable. The ordinary leakage in such cargo is less than two per cent; in this, instead of 11,760 cases, only 10,728 cases could be made up out of cargo. The questions for decision were: whether, by the clause in the contract, any amount of leakage or damage was excused, or whether only a reasonable amount was contemplated by the parties: and whether the implied condition, that the cases should be merchantable, *i.e.* fit for the purposes contemplated, was annulled by the express stipulation as to leakage. The jury found for the defendants: considering that ordinary leakage only was contemplated, and that the implied condition did attach, and this finding was endorsed by the learned judge. There was a further point in the case, of great importance, namely that the state of cases was material to the determination of the merchantable condition of the cargo. The decision is a sound one, whether viewed by the light of common sense, or determined by the leading principles of the law merchant.

There is a feature in the case which we are glad to be able to notice, that the action of the defendants in rejecting the cargo was not prompted by the then existing state of the market. They were not very keen about the transaction; but the contract was made during a firm market, and when time for fulfilment came, the market was, if anything, better. Japanese traders should especially note this: for with their existing loose notions of the obligations of merchants, and their hazy ideas of commercial credit and commercial honour, it too often happens that the fulfilment of their contracts depends on the existing state of the markets, and on that alone. Both to them and to foreigners—as kerosine oil is an important staple—we expect that the case, altogether, will be found very interesting. We must not omit to state that we are indebted to the *North China Herald* for the text of our report.

The second case we have selected for record is the charge against Mr. Hartley for smuggling opium. It will be seen from the report, that there was a great divergence between the results of the analysis made by Dr. Geerts, and that made by Mr. North; Dr. Geerts finding only four-tenths per cent and two per cent, respectively, of morphine in the samples submitted; Mr. North finding in one, one-and-a-tenth,—in the other, four-and-a-tenth. Mr. Wilkinson said it was impossible to reconcile the difference: so we must assume that he relied on that of Mr. North, for he decided that the opium was fit for smoking. Now the contention of the prosecution was that there was no morphine in this stuff, therefore it was not medicine,—it was worthless. But if their contention is correct, and we must always bear in mind that the *onus probandi* lies on the prosecution, the stuff in question was not Opium, and therefore the importation thereof is not prohibited. The valuable principle in opium, whether for smoking or for medicine, is morphine. The morphine being expunged, the article ceases to be opium, and becomes "stuff," matter, nondescript, what you will,—and so importable, as rubbish, under some category or other of the Tariff Regulations. Neither can we agree with

the decision of the judge that the less morphine the drug contains, the better it is adapted for smoking. The value of opium, to the opium-smoker, or opium-eater, as well as to the pharmaceutical chemist, varies in direct ratio with the quantity of morphine it contains: the more morphine, the greater delight the consumer gets out of a given quantity. It is well known that the Smyrna drug is the most prized by the European opium-eater; the high price of it alone prevents its use by the Chinese. If, then, we have it established—as we have by the decision in the previous case—that opium containing ten *per cent* of morphine, and coming from Smyrna, may be imported, because it is fit for medicinal purposes; and if the importation of Opium containing only four *per cent* of morphine is prohibited, because it is not fit for medicine, but is fit for smoking;—we can hardly fail to be impaled on one or other of the horns of this dilemma: we must permit what is most destructive to the opium smoker, or we must prohibit what is most valuable and almost essential to the chemist. The difficulty is a grave one, and one, in our opinion to be solved by fair-spirited legislation, rather than by acrimonious litigation. When commenting five or six weeks ago, upon the decision in the first case against Mr. Hartley, we came to the conclusion that the only practical way of enabling the Japanese Government to discriminate between the two classes of opium, or rather between the two destinations of the drug—the chemist's draught, or the smoker's pipe—would be 'to give them the power to demand from the importer satisfactory proof that he imports it for his own use as a medicine, in which case he must be a medical practitioner or a druggist: or that he imports it by direct order from some customer who is either one or the other.' The decision in this second case strengthens us in our conviction.

If they will fill four pages, we propose to report two more cases next week. Meanwhile we have to point out to our readers that the six pages which contain this second number of our Law Reports are so arranged and numbered that they can be bound separately, at the close of the year, from the rest of the paper; and also to state that, so soon as we receive a sufficient number of orders for copies to justify us in doing so, we will reprint, from the number of this Review in which it appeared, Law Reports No. I. which contained the first opium case:—that of *Regina v. Hartly* of February last. In anticipation of this, we number our pages to-day from 5 to 10. At the end of the year we shall furnish subscribers with a title page and index.

'RUINED RIVERS' AND DUTCH ENGINEERS.

FOR more reasons than one, we think it well to elevate the following letter from the comparative obscurity of small print and a correspondence column, at the fag-end of the paper, to a more prominent position.

To the Editor of the "Japan Times."

SIR,—Allow us to insert in your paper a few remarks, in order to protest against the manner in which you attacked in your leading articles of the 23rd and 30th of March the works of Dutch Engineers, which are in course of construction on the Yodogawa and elsewhere.

It is not our intention to discuss the value of your articles from a hydraulic point of view; we merely feel obliged to communicate the following to your readers, to let them judge whether your rude attack is justified or not.

At the request of the Japanese Government, we Dutch engineers made a plan for the improvement of the channel of the Yodogawa, for the mouth of the river, and for works to prevent the sand and other solid matter of the denuded hills from being brought into it.

The expense of improving a river of such magnitude as the Yodogawa being rather high, and the Japanese Government being only willing to expend annually a limited amount of money, it cannot be expected that the improvement should be finished in only a couple of years.

We commenced at the sources of the river by making—as far as the limited means allowed us to do so—barriers, reservoirs and other works, to check the current of the watercourses, and to prevent sand and other solid matter from being carried into the main stream; we also on rather a large scale made works to protect new plantations on the bare, sandy mountains.

At the same time we undertook the improvement of the channel of the river proper between Fushimi and Osaka.

To get as soon as possible some effective results, we undertook first those parts of the river where navigation was most obstructed, or where the dangerous condition of the dikes made it necessary to protect them.

Not "a few hundred yards near Fushimi" only, as you state in your paper, but many places of many hundred yards in length are to be found already, where navigation now meets with no difficulty, and where the dikes are brought into a condition to resist permanently the strongest current.

In view of the good results obtained, the Government has resolved to improve the whole river from Fushimi to Osaka, to continue the works along the torrents and on the sandy mountains, and is about undertaking also the improvement through Osaka down to the sea.

You admit in your article of 23rd March that for such a length of the river as our fascine works ("barriers" as you call them) have been placed in position, they have kept the river-bed clear, by creating or rather assisting the scour.

You go on to say that, in order to be sure of a navigable channel over the whole river, these works should have been made as far as the channel was wanted.

Nobody will deny that.

But then comes your sentence: "which we need hardly say was practically impossible;" and yet, as a matter of fact, not only has the experience, obtained by the works made, shown that it will be quite possible, even with a comparatively small outlay, but actually a considerable part of the whole length between Fushimi and Osaka has already been improved.

Your statement, that the ultimate effect of the work was "to drive down upon Osaka thousands of tons of solid matter," shows either that you did not inspect the river, and did not see how the scoured solid matter found a place behind the groyne and training walls, or that you did not altogether comprehend the system.

Every one must admit that it is most unpleasant for us to continue a discussion, which was started, as it seems to us, without any provocation whatever. We refrain therefore from refuting your statements, that a small ditch like the canal from Osaka to Sakai could spoil such a river as the Yodogawa, that the Ishicari river in the island of Yesso has no bar, that the Shinanogawa is the outlet for the watershed of the provinces Shinawa (?) and Mushashi (!), and that the works, necessary to prevent the sand of the denuded hills from coming down, are certain, inexpensive and easy, that their results are immediately apparent, etc.

We can not however quite conceal our surprise at your apparently mixing us up with former Japanese engineers, who followed a system, which their own countrymen now perceive to be very defective, and at your seeming, for instance, to blame us, as if we had ever approved in the slightest degree of digging the Teradomari canal.

We are, Sir,

Yours truly

C. J. VAN DOORN,
G. A. ESCHER.

Tokyo, April 4th, 1878.

[This letter is so easily answered, that its authors, we imagine, will have reason to regret that it was ever written. It has all the faults which usually disfigure such compositions:—it states its writers' case badly, because it states it from too narrow a point of view; it is open to the grave objection that it presents nothing of the case for the other side that it does not distort; it contains unsupported assertions and garbled quotations; begs the question and suppresses the truth. Such a petard usually hoists its own engineers.

Messrs. Van Doorn and Escher commence by protesting that it is not their intention 'to discuss the value of our articles from a hydraulic point of view,' and seek only to defend themselves against what they are pleased to call an unprovoked and unjustifiable attack.

But our readers, foreign and Japanese, have a greater claim on our consideration than these two gentlemen, and for them, the 'hydraulic point of view' is the only important one. We are fully prepared to maintain the value of our articles, as setting forth the true principles which should guide the hydraulic engineer in rebuilding rivers, and Messrs. Van Doorn and Escher stand convicted, out of their own mouths, of departing from those principles. Our criticism of the work of the past, and our advice as to the operations of the future, were written for the behoof of the Japanese Government, on whom rests the responsibility of expending the public money on such public works to the best advantage. Our allusion to the work of their Dutch employees, on one river only, was incidental and slight: indeed, part of our correspondents' grievance appears to be that we did not sufficiently notice it. To our thinking, we treated them with a singular tenderness: for if we had stated the sums of money thrown away upon their 'small ditch'—as they stigmatize the canal from Osaka to Sakai—and upon their subsequent work farther up the Yodogawa, and had compared expenditure with result, we should have had to conclude the paragraph, by asking our native friends in the Japanese Government whether such a little game was worth such very costly candles.

But, we repeat,—in writing on the large subjects of afforestation and restoration of rivers, Dutch Engineers and their *Zinkstuks* were *minutiae* with which we concerned ourselves very little, and to which we referred quite incidentally. When our essay is completed, their Japanese employers will know where these gentlemen and their favourite hydraulic apparatus can be employed, economically and with advantage. That they are misplaced in the middle section of the Yodogawa is certain. No mere layman, reading our articles of the 23rd and 30th of March, will fail to appreciate the value of our argument that it is to the sources of a ruined river that the attention of the hydraulic engineer should be first, and for the time, solely, directed: only the exercise of simple common-sense is requisite to see that until he has thoroughly checked the discharge of lithic matter from the various contributories into the main bed of the stream, money and labour spent upon that main bed are thrown away. And it is precisely because the expenditure of both money and labour is reduced to a *minimum*, when attacking the sources of the evils which have to be cured, that we hold that these are the points which should be first attacked. A layman can see that this theory is correct; a hydraulic engineer knows that the theory has been abundantly proved by the practice of the greatest men in his profession. But Messrs. Van Doorn and Escher, by their own confession, have committed the grave error of undertaking 'at the same time,' the improvement 'of the channel of the river proper between Fushimi and Osaka,'—that is, in its mid section,—and its reconstruction in the upper section, by making 'barriers, reservoirs and other works, to check the current of the watercourses,' and also, 'on rather a large scale, works to protect new plantations on the bare, sandy mountains.' We may remark, *en passant*, that these 'plantations' were not visible when we lately surveyed the country. And certainly, until the mountains have ceased, to great extent, to deserve the epithets 'bare and sandy,' and until the whole series of works at the watercourses are complete, so that nothing but water escapes from them, the work on the middle section should have been postponed. Foreign engineers who work otherwise are only a degree better than the Japanese, whom we condemned for 'pottering about the rivers' mouths'.

The motive of their error is not far to seek: they ingenuously state it when they tell us that they set to work on the middle section, in order 'to get as soon as possible some effective results'—in other words, to show their Japanese employers something for their money. We must here quote a couple of sentences from their letter in full. They write:—

"At the request of the Japanese Government, we Dutch engineers made a plan for the improvement of the channel of the Yodogawa, for the mouth of the river, and for works to prevent the sand and other solid matter of the denuded hills from being brought into it.

"The expense of improving a river of such magnitude as the Yodogawa being rather high, and the Japanese Government being only willing to spend annually a limited amount of money, it cannot be expected that the improvement should be finished in only a couple of years."

They then go on to state that they went to work, *at the same time*, on the upper section and watercourses, and on the middle section between Fushimi and Osaka—but 'to get as soon as possible, some effective result' they 'first' undertook 'these parts of the river where navigation was most obstructed, or where the dangerous condition of the dikes made it necessary to protect them.' They must have spent a great deal of money on the cart which they thus put in front of the horse, for they tell us that

"not 'a few hundred yards near Fushimi' only, as you state, in your paper, but many places of many hundred yards in length

"are to be found already, where navigation now meets with no difficulty, and where the dikes are brought into a condition to resist permanently the strongest current."

Certainly, no one with any knowledge of the subject,—most certainly not we ourselves,—could expect that the restoration of the Yodogawa 'should be finished in only a couple of years.' But impatience is a patent vice of the Japanese character and, to please them, the temptation is great to pander to this fault, to give them at once, 'something for their money.' But surely foreign scientific men should resist this temptation, and do what they can to cure, not encourage, the defect. When the plan of improving the Yodogawa river was submitted to the native government, it should have been stated so clearly as to be unmistakeable, that no immediate results would be visible. But at the same time, that no large grant of money was necessary. The first thing to be done—they should have been told—was the re-plantation of trees upon hills where the river takes its rise; and as the annual growth of a tree is an arbitrary quantity, which cannot be increased by any expenditure of money; time and patience would be wanted, not cash. We are willing to allow on the other hand, that—given the money, and *zinkstuks* can be made *ad infinitum*, but we hold that expenditure in this direction was unjustifiable, and that it was the engineers' duty to resist, not to encourage it. What has been the result of the plan as carried out? We fail to see what our correspondents call the 'magnitude' of the Yodogawa, but we are fully aware of the magnitude of the cost of their improvements, and they would contribute something to this discussion far more valuable than their present letter, if they would favour us with a few figures.

We gave our correspondents full credit for conscientiousness and industry in the work they have done, and into the details of which they enter more fully than was necessary for our own arguments. And, could we lose sight of the vitiating error, that the work has been done at the wrong time, we might have also have credited them with something more. Not that we by any means approve of their system, which they must give us leave to tell them we 'comprehend' as well as they do themselves. But we greatly prefer the system of 'guiding banks' of Laport and de Vézian, constructed with due regard to the law of reciprocity of curves, as explained by us in the second part of our essay (March 30) which assists the 'rhythmic flow' of the water. And when Messrs. Van Doorn and Escher tell us that we 'did not see how the scoured solid matter found a place behind the groynes training walls'—by which phrase, they give the impression that all the lithic burden of the stream is there deposited:—then we must take leave to tell them that this is one of the points on which we rely, to justify us in accusing them of '*petitio principii*' and '*suppressio veri*.' What we did see was that a small portion of the river's burden was so deposited, but infinitely the greater part was swept down upon Osaka, as we described it, by thousands of tons: and we are fully penetrated with the belief that, while they have, in the middle section of the river, and in isolated spots, improved the navigation and strengthened the dikes, they have done this at the expense of the lower section, and that the mischief they have thus wrought far more than counter-balances the good they have done.

There are but one or two more sentences in their letter which we need notice: and these only in support of the accusations we make in the first paragraph of our reply. First they write:—

"You go on to say that, in order to be sure of a navigable channel over the whole river, these works should have been made as far as the channel was wanted.

"Nobody will deny that.

"But then comes your sentence: 'Which we need hardly say was was practically impossible;'

This is a 'garbled quotation.' What we wrote was as follows:—After stating what had been done, in our opinion, by the works between Fushimi and Osaka, we proceeded:—

"but—to have been of any real value, they should have been continued away, past Osaka to Temposan, and thence some half mile or so out to sea; which we need hardly say was practically impossible."

The 'practical impossibility' in our mind was of course the expense. If Messrs. Van Doorn and Escher will be good enough to tell us how much has been spent on the Yodogawa already, and how many hundred yards, or thousand yards, they have improved;—then, by simple Rule of Three, they may be able to prove 'practically possible' what we affirm cannot be done. But until they give us more arithmetic and less assertion, we shall claim the victory in the discussion.

The last two paragraphs of our correspondents' letter supply us with our proof that they distort our case, and make 'unsupported assertions.' They tell our readers that we have stated that 'the Ishicari river in the island of Yesso has no bar.' Now, in the

articles which they were reviewing, there is no mention whatever of the Ishicari river, whereas there is the very plain statement:—'Every river is more or less obstructed by a bar;—and in another article, the only one in which we mention the Ishicari at all, we say that it has twelve feet of water at its mouth. Nowhere do we say that the Ishicari river has no bar, and this very sentence, taken with its context, as good as mentions that it has one,—with twelve feet of water on it at low tide.

To accuse us of blaming them for digging the Teradomari canal, or for approving of the work, is as complete a mis-statement, and as severe a distortion of our argument. To the best of our belief, the Teradomari canal was dug before these gentlemen came to Japan. We were quoting a report upon it four years old, and had not the Dutch engineers in view at all in writing upon it. The paragraph condemning it certainly followed that containing our strictures upon their works in the Yodogawa; but the two subjects were totally disconnected; and there is not a line in our remarks on the Teradomari cutting, referring in any way to the Dutch engineers. One might as well discern a connection between the marriage and burial services, because they happen to be both in the same prayer-book.

Our friends say that to continue this discussion is unpleasant to them. This is very regrettable, because discussion on so important a subject as Afforestation or the Restoration of Rivers could hardly be more usefully employed. We are specially interested in the 'new plantations' they mention on the water-shed of the Yodogawa; in their works to protect these, made on 'rather a large scale,' and on the 'barriers, reservoirs and other works' which they tell us they have made to check the current of the water-courses, &c.—in fact to do precisely what our articles told the Japanese Government ought to be done. It would perhaps be too cruel to suggest that our articles are responsible for their improvements, but it is not long since we inspected the river between Osaka and Fushimi, and traversed the greater portion of its water-shed; and we must confess to having failed to observe any signs of systematic afforestation of the denuded and disintegrating hill sides, or of scientific treatment of the water-courses. Would our correspondents kindly inform us of the locality, area and cost of these new plantations, these dams, reservoirs, barriers, &c.? These particulars would be a valuable contribution to our present stock of information; and, on our part, we will undertake,—if Messrs. Van Doorn and Escher will favour us with this information, will address us with a little more courtesy, will quote our words with a little more accuracy, and will treat our arguments with a little more justice;—we, on our side, will engage to treat their next letter with a little more respect. Ed. J. T.]

YOKOHAMA: SATURDAY, APRIL 13, 1878.

NOTES OF THE WEEK.

FRIDAY EVENING, April 12th.

SHOULD the number of the arrivals and departures of mail Steamers to any given port be a criterion as to the business of the place, then surely Yokohama must be thriving; but we fear that 'much cry and little wool' is a correcter and conciser way of putting the state of the case. Since our last Notes of the Week were written, three outward and three homeward mail steamers have departed and arrived, besides the usual China and coasting steamers, and an extra mail steamer or two, to and from Kobe. The *China* left for San Francisco on Saturday morning last, followed by the *Volga* on the 9th and the *Malacca* on the 10th for Hongkong and Europe. The *China* and *Oceanic* from San Francisco arrived on the 6th and 11th respectively. The P. and O. Steamer *Nizam* that was bringing the London Mail of March 1st having broken down and put into Saigon for repairs, her mails will be brought on by the first opportunity which occurs after their arrival in Hongkong. The next homeward mail is the French, which

leaves here on Wednesday next, due in London June 10th. The *China* is advertised to sail for San Francisco to-morrow week.

The rowing season was inaugurated by the Y. E. C. at their new boat house on Saturday last, but owing to the inclemency of the weather the usual procession of boats could not take place.

The many friends here of General Van Buren were sadly disappointed to find on the arrival of the *Oceanic* that he was not a passenger thereby. We are sorry to hear that the gallant General was detained in New York through indisposition, but we trust that ere this, he has recovered and is on his way hither to fill the gap that was caused by the absence of so useful a member of the Consular Board, and of this Community.

We are glad to notice from the *Army and Navy Gazette* that some deservedly popular officers and friends of many in Yokohama have received advancement in a service where promotion is anything but rapid. Colonel Richards, Lieutenant Colonel Burton and Captains Walsh and Broughton of the Royal Marines have each got a step in rank.

The man Cannon, who has been taking up so much of the valuable time of our indefatigable Law Secretary, has been leniently sentenced to six months imprisonment after a most patient hearing. The defence set up was too transparently thin to receive the slightest attention. Can any one fancy a Japanese, of all nations, giving credit for thirteen years? It is true that this was the period for which the Government lent its paper in 1870, but this can hardly be urged as a precedent in ordinary mercantile operations.

From larceny to burglary is but one step. Our next door neighbours, the P. & O. Co., were broken into one day this week; a tin lined case of books was all the property that was carried away and that was subsequently found, opened but with the contents intact, near the public gardens.

THE PERFORMANCE IN AID OF THE CHINA FAMINE FUND.

NO resident in Yokohama needs to be told that the prominent social event of the week has been the entertainment given at the Gaiety Theatre on the night of the 10th inst., in aid of the China Famine Fund. We have more than once expressed our opinion of the chances of these contributions reaching the miserable creatures for whose benefit they are subscribed, indeed of the possibility of relieving the poor people at all, but we will not mar the graciousness of the present gift by the repetition of the expression of an opinion which we find to be in opposition to that of a majority. Captain Bridgford's announcement, at the end of the performance, that a repetition of it would take place to-morrow, for the benefit of a local charity, the Yokohama General Hospital, was received with a well-deserved sympathy, and we suppose that no one will quarrel with us when we say that in this we ourselves cordially share.

The dramatic or musical critic is expected, by most amateurs, to discharge his duty to the public in a very inefficient way: to touch very lightly on their faults, and to bring out, as prominently as possible, any point in their performances which will carry a gilding, however thin, of praise. Amateurs have, certainly, a considerable claim to indulgence in this respect. They must necessarily deny themselves many other pleasures which would otherwise fill the leisure hours they devote to rehearsal, they have to submit themselves to a wholly uncouth and irksome discipline, and restraint, to exercise much forbearance towards each other's shortcomings, to go through a certain amount of positive drudgery which must remind them of their schooldays. But they have, on the other hand, their compensatory pleasures—or, of course, none would suffer the pains. They have all the fun of the rehearsals, with the infinity of jest and bye-word which arise from each other's mistakes or misfortunes; they have the pleasure of surmounting difficulties and contriving substitutes for the orthodox appliances and 'properties' of the real stage; they enjoy the childish pleasure—and what pleasures are so keen, so full of delight as the pleasures of childhood—of 'playing at work,' of doing 'for fun' what many of their hard-worked fellow-creatures have to do for a minute number of shillings a week; they have the opportunity of displaying their personal advantages to perfection in fancy dresses, and of exercising their artistic taste and displaying their judgment, in arrangement of colour and choice of material, their historical and archaeological lore, in designing costumes or modelling accessories. So much for the preparation. Then they have the crowning pleasures of the excitement and the triumph, on the nights of performance: of effort achieving success, and rewarded on the instant by applause, which an audience of friends never grudges, nor gives in stinted measure—and they have the culminating delight, worth all the rest of their pleasures together, of the supper afterwards, in costume, when all their little troubles are over, and when compliments are as abundant, as sweet, and as frothy as the champagne.

But they cannot escape the common lot. The mimic life of the stage closes with the falling curtain, and almost before the foot-lights are down, reaction sets in. Cruel would be the critic who could add to the natural depression of spirits inevitable to the 'next morning,' too harsh a review of their efforts to amuse. But something is due also to the audience who have had no share in all the varied pleasures of the actors which we have detailed, and have sometimes even been consumedly bored, and yet had to simulate being vastly entertained. Many an amateur actor, too, especially if of any length of standing, despises the criticism that is all flattery, and is glad to take the hints that are given him from those who, he knows, must be better able to judge, from the front, of the effect of his performance, than he can possibly do on the stage. Of stronger fibre than the delicately susceptible being who cannot exist without applause, and faints under dissection of his reading of a part; than the Lord Fannies of whom it might be written

'Strange that the soul, that very fiery particle,
Should let itself be snuffed out by an article,'

he adopts suggestions which are worth having, and amends faults which he finds remarked. Though, therefore, dealing tenderly where tenderness is requisite, and rather hinting disapproval by silence, than giving it full expression, the critics of this Review will not entirely abdicate their censorship. As indeed may be seen to-day.

Who may be responsible for the selection of the *lever de rideau* to *Trial by Jury* is no business of ours, but we cannot but express extreme surprise that the indubitably talented actors who were so good as to take part in it should have been condemned to waste their ability upon a wretched trifle, that was damned in London, and most deservedly damned too, before it had run a week. Nothing could possibly be done with such a piece but to make it a succession of carefully dressed, carefully grouped, *tableaux vivants*, in which every atom of accessory colour and costume should have been the subject of a study, in which a critic's eye could no more detect a flaw than in one of Meissonier's pictures. And how can this possibly be done here, in Yokohama, where gentlemen of the Georgian era have to walk the stage without swords, where a silk stocking to match a coat cannot be got for love or money, where there appears to be no authority, living or written, on the question of costume, where a valet is dressed apparently in the cast-off clothes of his master's great grand father, and where Gainsborough's Duchess of Devonshire sits on one of Lane and Crawford's garden chairs? Amateurs should, of course, always choose 'dress' pieces, but, and especially when a company is so fortunate as to have ladies to fill the lady parts, and ladies—we may be permitted, we hope, to say—competent to fill really arduous parts with force, grace and tenderness; then it really becomes provoking that opportunity should be squandered by the presentation of such rubbish as 'Atchi.'

'Atchi' being absolutely beneath criticism, we gladly pass to *Trial by Jury*, which, after a little difficulty with the mechanical 'lever de rideau,' which set the audience laughing before the 'Trial' began, was at last—after so many weeks of anticipation, presented to the eager spectators.

This work was first produced about three years ago at the New Royalty Theatre in London, at that time under the management of Madame Selina Dolaro. Since then it has frequently been performed at other London theatres, and in numerous provincial towns, and has even travelled to the colonies. Our neighbours of Hong-kong and Shanghai have also given the piece, but shorn of most of its beauties and attractions, by reason of the necessity of giving the female parts to male voices. Here, thanks to the noble spirit evinced by the ladies of Yokohama whenever the word 'charity' is mentioned, we were treated to a representation such as we have never enjoyed before in this benighted corner of the globe.

We cannot too heartily thank the Choral Society (and above all, the ladies, especially the bridesmaids, who played their parts to perfection, for so generously giving up some weeks of their regular work to the preparation of *Trial by Jury*. We deeply regret that the accompaniments were, after all, rendered by two jingling pianofortes, admirably as these were played, instead of by the excellent little band under Mr. Wagner's direction. This would have added immensely to the *tout ensemble* and we can hardly understand why their aid was not availed of, especially as the Band parts were all prepared. The quality of the Orchestra was thoroughly evinced in Roesini's fine prelude to "L'italiana in Algeri" a set of Strauss' ever-verdant waltzes and the charming Overture by Suppe to the *Mauer und Schlosser*. But we suppose that, superadded to the really great difficulty of drilling over thirty vocalists, that of bringing another *corps*, of a different arm of the service, into line with them, was too much, even for the gallant commander-in-chief and his able lieutenants.

It would be a work of supererogation to sketch the trifling plot of this 'Dramatic Cantata' of Gilbert and Sullivan, the out-come of that wild, wierd, English humour which sees the joke of a baby being sat upon, or roasted,—in mistake for a sucking-pig—in a pantomime, and sympathises with and applauds that atrocious criminal *Punch* who, after committing a dozen murders, finally cheats the hangman, and hardly succumbs to the Devil. It is with the music, of course, that we have now chiefly to do. Though far inferior to that of *Coz and Boz*, this is pleasing, melodious and tuneful, without being in the least original: it shows evident marks of haste in composition, and savours much of plagiarism and *pasticcio*. For instance, the *sestett* reminds one very forcibly of part of the *Sonnambula*, and other portions of the work irresistibly recall strains of Donizetti and Offenbach. Still in some parts it is admirably suited to the spirit of the situations; notably in the characteristic chorus of Jurymen:—"Oh, I was like that when a lad," in the joyous Intrada, where the bridesmaids usher in the "disconsolate fair," and again, where the bridesmaids endorse the Defendant's touching appeal to the Jury:—"But this he is willing to say, &c."

These are the gems of the work, and were so well rendered as to call forth a very whirlwind of applause, with demands for repetition which could not be denied. Indeed the execution of the whole Chorus work was thoroughly good, and by far the best part of the performance. It reflects great credit on all concerned, Conductor, singers and stage manager—that hard-worked but ill-rewarded slave of the lamps, on whom depends all the 'go' of a piece, and who gets so little recognition of his merit.

Touching the execution of some of the principal parts, we must own to no little disappointment. Our leading musical Amateurs here have, in times past, won for themselves such great renown, that the public has some right to feel aggrieved when any of them fail to rise to the situation and neglect to do justice to their parts. The *Usher* was, as usual, a finished performance, carefully studied; the make-up capital, and all the music well given, while appropriate and not overdone by-play greatly added to the general effect—the *Counsel* also gave a careful rendering, but shewed symptoms of a little nervousness, doubtless caused by his being compelled to roam about the stage, instead of being provided with his usual seat and table, whereon to deposit his books and papers. His make-up, in caricature of a leading ornament of our local bar, who has just left us for Europe, was extremely good, and the caricature, who has so often suffered from Mr. Wirgman's pencil, will regret having been absent from the Gaiety Theatre, when Mr. Henley held the mirror up to nature.

The acting of the *plaintiff*, *prima donna*, was thoroughly good, and the part was magnificently, but appropriately dressed. The *Defendant* displayed his really superb voice in a manner which gratified his every hearer, and surprised us, by acting his part, too, with more ease and confidence than we had given him credit for possessing. It is not given to every tenor to be also an actor, and, listening to a Mario, one could forgive the singer, were his pantomime that of a *marionette*. Listening to Mr. Hyde, all that was left to desire was that an organ of such power and really exceptionally fine quality should have been wasted in drawing rooms, instead of receiving the training which would have given us another English tenor for the lyric stage. When supported by the fresh, pure, joyous voices of the 'rosebud garden of girls' who deserted their queen to assist him in his defence, the perfection of part-singing was reached, so completely did the *tons* of his voice harmonise with theirs, while giving full masculine 'body' to the melody. This number pleased us better than any other piece in the *cantata*. It was, of course, redemanded and a 'double encore' would have left us unsatisfied.

The *Judge*, from whom we had expected the most, gave us the least satisfaction. False notes, lapses in time, false dressing (for only when sitting in *banc*, or when trying criminal cases, do judges appear in scarlet robes and full-bottomed wigs) and, worst of all, in so experienced an actor, a false reading of the part. It may be that the traditions of a former success clung so closely to Mr. Pearson's memory, as to have muffled his judgment; otherwise it is difficult to understand how so accomplished an artist should have failed to see that the vulgarity of a journeyman hatter is totally out of place on the *Nisi prius* bench. Not 'to split the ears of the groudlings, who for the most part are capable of nothing but inexplicable dumb shows and noise,' not 'to make the unskilful laugh, while it cannot but make the judicious grieve'—but 'to hold, as't were, the mirror up to nature'—this, Mr. Pearson should have remembered, is the duty and the privilege of the actor, be he amateur or professional, and he who oversteps the modesty of nature deserves all the contempt and opprobrium which *Hamlet* heaps upon him in the great speech we quote. His first entrance was wrong, and in violation of both precedent and propriety: far more effective would have been his appearance, had he been marshalled into Court by the *Usher*, in-

THE JAPAN TIMES LAW REPORTS. No. II.

IN H. B. M. SUPREME COURT AT SHANGHAI.

Before R. A. MOWAT, Esq. and a Jury.

CHING-FOONG *versus* LANE, CRAWFORD & Co.

1878 } THIS was an action to recover Tls. 26,995, the
Feb. 13. } contract price of 12,000 cases of kerosine
oil, sold by the plaintiff to the defendants.

The contract was made through a broker, and bought and sold notes, signed by plaintiff and defendants respectively, were exchanged between the parties on the 22nd of November, 1877. The terms of the said notes, which were identical in form, showed a contract for the sale by plaintiff to the defendants of 12,000 cases of Devoe's kerosine oil, each case to contain 10 gallons of oil in two tins, to arrive *per* S.S. *Rajanattianuhar* from Hongkong, price Tls. 2.60 per case, to be delivered one month after landing, buyers to have option of taking godown orders for same as soon as landed, in which case to be allowed one month's discount on purchase money; "*damaged goods and leaky cases to be allowed for by the seller.*" The ship arrived on Nov. 27th, with 12,000 cases on board, and the unloading thereof commenced at once and the cargo was landed with all convenient speed. On the 2nd of December the defendants were informed that a considerable number of the cases were found to be leaky and oilstained, and that the cargo could be inspected at Muirhead's godown, Pootung, where kerosine was usually stored. On the 3rd of December, defendants wrote to plaintiff, refusing to accept delivery of the cargo, as the same was damaged and unmerchantable. The petition contained the above facts, and further alleged, that plaintiff never warranted his 12,000 cases free from damage, merchantable, or fit for shipment: and also set up a custom of the port of Shanghai under following terms:

"the practice in the kerosine oil trade at Shanghai, when such oil has been sold and purchased in bulk, and the tins containing the oil are found before delivery to have leaked, is for the vendor to fill up tins which have leaked, one from the other, so as to complete the quantity of 10 gallons in each case—this practice has been followed in the case of the 12,000 cases *ex s. s. Rajanattianuhar* purchased from the plaintiff by the defendants as hereinbefore stated, and the result has proved, after refilling the leaky cases, to be that there were and are 10,798 cases of Devoe's Kerosine Oil, each containing 10 gallons of oil remaining out of the 12,000 cases of oil originally laden on board the *s.s. Rajanattianuhar* for the voyage from Hongkong to Shanghai, during which the contract mentioned in the 2nd and 3rd paragraphs of this petition was concluded," and then averred tender of 10,798 cases, and readiness and willingness to deliver the same.

The defendants, in their answer, admitted the terms of the contract as stated, but traversed the statement that the ship arrived with 12,000 full cases of kerosine on board, and also traversed the plaintiff's readiness and willingness to deliver, in the following terms:—

"The defendants, in answer to the petition, further say that at no time since the making of the contract, mentioned in the petition, has the plaintiff been able to perform his part thereof, and at no time has he offered to the defendants the 12,000 cases of oil which they contracted to buy. The plaintiff did offer to the defendants certain cases and tins containing oil, but the same were wholly unsaleable and unmerchantable, owing, as the defendants are informed and believe, to their having been shipped in bad order and condition at Hongkong."

"Lastly, the defendants deny that the plaintiff has suffered damage from any act or default of the defendants."

At the time of signing the contract, neither of the parties were aware of the condition of the cargo, the plaintiff having bought the same cargo "to arrive" from a merchant, a few days previous to the sale to the defendants. When the cargo was landed, it was found to be in a bad state, all the cases being stained, and more than half the tins leaky; 5,150 cases were sound, 6,850 required to be filled up; these 6,850 produced after the filling process was completed 5,648 cases; 1,202 remaining empty. The defendants refused to accept the cases tendered to them,

because they were unmerchantable. At first the defendants set up the defence that the cargo was not fit for shipment to Japan; but this defence was abandoned by defendant's attorney, as there was no evidence to show that plaintiff knew that defendant wanted the cargo for the Japan market. [It further appeared that tender was made to the defendants of 12,000 clean and sound cases of kerosine, portion of a cargo by another ship. These too, the defendant refused to accept, and much evidence was given on the negotiations which took place for the acceptance of this cargo by the defendants: but as the judge directed the jury to dismiss from their minds all they had heard relating thereto, this evidence is omitted.] The practice of the trade at Shanghai with regard to leaky cases of kerosine, was shown to be as stated by plaintiff's petition;—that all cases containing leaky tins were placed apart, and the deficiency made up to ten gallons in each case; but it was also shown that the average leakage in a cargo in good condition, amounted to one half per cent in cargo by sailing ship, and to three quarter to one per cent in that by steamer. The cargo in question, as exemplified by the samples in court, three cases from the portion containing sound tins, and three cases from among those which had been refilled, was stated to be saleable in Shanghai among Chinese in quantities of from 100 to 1,000 cases at Tals 2.25, the market price for cases in good condition being Tals 2.50 to 2.60. At the time of contract, the market was firm; when the cargo was landed, the market price had risen to Tals 2.90 but subsequently experienced a decline to Tals 2.50 to 2.60. The other facts of the case sufficiently appear from the arguments of the advocates and the charge of the judge to the jury.

A. ROBINSON for the plaintiff. In the first place, the only two conditions which were necessary to be fulfilled to make the bargain between the plaintiff and the defendants complete, were—first, that the steamship *Rajanattianuhar* should arrive at Shanghai; and, secondly, that she should have on board 12,000 cases of oil: (Benjamin on Contracts of Sale, first edition, page 436.) If the *Rajanattianuhar* had not arrived, or had she arrived having jettisoned a quantity of the oil, there would have been no bargain or sale between the parties at all; but the moment she did arrive with the 12,000 cases of oil on board, the sale was completed, and plaintiff was bound to deliver, and defendants were bound to accept, the cargo of oil in accordance with the terms of the contract. (Heyworth v. Hutchinsons, L.J. Queen's Bench, page 270.) The defendants were bound to take delivery, and if they were not satisfied, their remedy was to sue upon the agreement for an allowance, or plead the inferiority of the article tendered, in reduction of the price. In the present case, an allowance had been tendered for damaged and leaky cases; and it would be for the Jury to decide whether that allowance was a reasonable one or not. The material item in this particular contract was to be found at the end of it. Generally it would be seen that in the printed form of bought and sold notes there were the words, "N.B.—Damaged goods to be rejected." It would be seen in reference to this, that before the parties signed the contract, they struck out "rejected" and substituted, in writing, "damaged and leaky cases to be allowed for in godown." The evidence would show that a contract in that particular form was a very uncommon one; the ordinary form was for the seller to sell the oil with the damaged cases to be rejected, or with a clause that the cases should be in good condition, but it was very seldom that there was a distinct stipulation that there should be an allowance for damaged and leaky cases as in this instance. Both parties knew no doubt what they were doing when they agreed to that stipulation. Defendants appeared to have had some knowledge of the cargo they were purchasing, and plaintiff had been careful to sell on the same conditions under which he bought; and they had expressly struck out the power which the defendants would otherwise have had in the ordinary course of things to reject damaged cases, and substituted a distinct stipulation that an allowance for them was to be made. Notwithstanding this, defendants wished to claim a right to reject the cargo, but they were plainly precluded from taking that course by the alteration made in the printed form of the contract. The grounds upon which they claimed a right to reject the cargo were, that it was not saleable or merchantable. Defendants had further said that it was wholly damaged and unfit for shipment, because

the cases, in which the oil was packed, were not in good condition. That was their contention. The reply to that on behalf of the plaintiff was that the contract did not pretend to say the cargo would not be damaged. What it did say was this. It expressly stated that if there were any damaged or leaky cases, an allowance was to be made for them; but there was no power for the defendants to reject them. The parties had plainly contracted with the view to meet a possibility—damaged and leaky cases. That possibility had taken place, and plaintiff had offered what he considered a reasonable allowance, thereby carrying out his part of the contract. The proper course for the defendants to have taken, having agreed to purchase certain quantity of cargo to arrive, and that cargo being here, and they finding fault with it on account of the damaged state of the cases, and being dissatisfied with the plaintiff's allowance—an allowance quite equal to any other made under similar circumstances—was to have paid into Court the amount which they considered themselves liable to pay. That would seem to be a reasonable course for them to have adopted, much more so than the one they had adopted, by which, notwithstanding the plain reading of the contract, they seemed to believe that they were entitled to damages for the non-delivery of 12,000 full cases of oil—a thing never contemplated.

Again as to the contention that there was an implied term in the contract that the defendants should receive 12,000 cases in a saleable and merchantable condition; it is clear that no implied terms can be imported into any contract upon a matter expressly provided for by the contract.—*Expressum facit cessare tacitum*. (Benjamin on Sales, 1st. Ed'n P. 491 and see case of *Dickson v. Zizinia* 20 L. J. C. P. P. 72) Moreover the plaintiff contracted to sell oil, he did not contract to sell cases; and he believed it was beyond all power of dispute that if the oil had been in perfectly clean cases, there would not have been a shadow of reason for any allowance to be made by the plaintiff or for the defendants to reject it. It was entirely the cases they objected, not to the oil in them, and it was not admissible to them to raise any implied term in the contract with regard to the cases, when the parties had expressly contracted as to what should be done if a certain thing occurred, namely, if any of the cases were damaged or leaky. The cases have nothing to do with the oil (*Gower v. Van Dedolzen*, 3 Bing. N.C.P. 717). But even if it was an implied condition, that the oil should be saleable and merchantable, he had another answer to urge to that plea raised by the defence, namely, that it was untrue in fact;—it would be proved that the oil was saleable as it stood. Mr. Robinson also cited the case of *Lucas v. Bristow* 17 L. J. Q. B. P. 364, to show that, as it was a clear stipulation in the terms of the contract, that leaky cases should be allowed for, sufficient had been done by the plaintiff in tendering the 10,798 full cases of oil, together with a fair allowance, on account of the missing cases, to entitle them to compel the defendants to accept delivery of cargo and to pay for the same.

R. F. WAINWRIGHT for the defendants. His defence was two-fold, 1st the oil was not a merchantable or marketable commodity, when it arrived at Shanghai, and 2nd., that the plaintiff was never in a position to perform his contract; that he never at any time offered to the defendants, and never was in a position to offer them, the goods they had contracted for. A man was not bound to take anything less than he had contracted to buy: and it was clear that the plaintiff was never in a position to deliver to defendants what they contracted for. He offered them nine-tenths of the whole quantity, but it was admitted that he was never able to offer them the remaining tenth. He would deal first with the branch of his defence;—that the oil was not marketable. The contract was a contract for the purchase of 12,000 cases of kerosine oil; each case to contain two tins, and each tin to contain five gallons. The oil was to arrive by the *Rajanathianuhar* from Hongkong; and he would admit, with his learned friend Mr. Robinson, in order to constitute a binding contract where goods were bought to arrive, that it was necessary the ship should arrive and that the goods should be on board. That was all Mr. Robinson had said was necessary. But he would add one more term, which was that the goods when they arrived should be fit for use—saleable and marketable. He was not going into the question raised by

the foot note on the contract, at present. That would come in due course; and he would now simply call attention to the proposition of law on which this first branch of the defence was based, namely, that there was an implied warranty in every sale of goods that they should be marketable. (Benjamin on Sale, 2nd edition, page 539. *Jones v. Just*, 37 L. J., Q. B. 89; *S. C. L. R. 3 Q. B. 197*.)

[His Lordship. There can be little doubt on the point; the difficulty is:—What were the 'goods' in this case?]

Mr. WAINWRIGHT—Undoubtedly that was the next question to be considered, and he thought there could be no doubt that in kerosine oil such integral parts as the cases were 'goods.' Great quantities of kerosine oil came to Shanghai, and everybody dealing in it knew that it was brought here to be sold to merchants, and then to be retailed to native consumers; and, also, that it was a large branch of the trade to reship to Japan and the outports. Therefore, it was self-evident that the oil would have to be handled about a great deal, and sent from place to place; and under such circumstances there was no doubt that the condition of the tins containing the oil and the cases in which they were packed, were most material parts of the commodity itself; in fact, if the tins and cases were not good the oil would not be saleable. And this applied most particularly to this part of the world, where the Chinese examined the cases of goods so minutely, and doubtless knew Devoe's cases of kerosine oil and the kind of tins it was put in, quite as well as Devoe himself. The Chinese trusted a great deal to the receptacle containing the oil, perhaps more so than to the quality of the oil itself; and that being so, his Lordship and the Jury could hardly fail to believe that the cases and the tins round the oil, now the subject of enquiry, formed a most important and material part of the commodity. On this point his learned friend had cited the case of *Gower v. Van Dedolzen*, 3 Bingham, New Cases, page 717, and he (Mr. Wainwright) would call attention to the same case. In giving judgment, Tindal, C. J. said he could conceive cases in which the condition of the receptacle might be material, and damage thereto would be a good defence; and this was a case meeting that view. He hoped to show that kerosine oil, in leaky tins and in damp saturated cases, was an unsaleable article; and that a man who found himself saddled with 10,000 or 12,000 such cases could not dispose of them except at a ruinous loss. In further support of the argument that there was always an implied contract that goods bought on description should be marketable, he cited the case of *Mody v. Gregson*, 38 L.J., Exchequer Reports, page 12, and *Chitty on Contracts*, page 419; and then said he would pass on to consider whether the foot note, "damaged goods and leaky cases to be allowed for in go-down," on the contract, in the present case, was sufficient to override that general proposition of law. His learned friend, Mr. Robinson, had argued that it was contemplated that the tins should leak, and that the cases should be stained and saturated with oil, which was to be a mere matter of allowances between the parties. He differed from that view, and thought he should be able to show, to the satisfaction of his Lordship and the Jury, that the meaning of the foot note must be taken to apply to what was generally understood to be the custom of the trade in Shanghai, and that it only meant that the ordinary percentage of damage and leakage was to be the subject matter of compensation, and that it did not mean that a number of the tins might be empty. That was what his learned friend's contention amounted to—that if all the tins were empty, defendants were bound to take 12,000 cases, and to pay something for them, subject to an allowance. It was a well understood proposition of law, that every contract must be interpreted reasonably; and the first thing to do was to look at the objects and intentions of the parties. However, he did not propose to go more fully into the question of the foot note on the contract, until he had produced his evidence. Various brokers would be called and depose to what was the custom of the trade at Shanghai, and they would also say what was the meaning of a stipulation of this kind; then the jury could form their own view of the matter. He would now touch upon the other branch of his defence—the way in which the contract was to be performed by the plaintiff. Now, on this point, it was most material that it was admitted by the plaintiff himself that he never had 12,000 cases of kerosine oil, of this particular cargo by the

Rajanattianuhar, to deliver to the defendants; he had tendered them nine-tenths of the total quantity, but that was not the 12,000 cases he contracted to give them. And what was further important on this point was, that the plaintiff had himself put it out of his own power to give them the 12,000 cases. When the steamer arrived, instead of going to the defendants and saying: "There is your oil, take it, and I will consider the question of leakage," which he ought to have done according to Mr. Robinson's contention, he went to work himself, at his own expense, refilling the tins from one another and tinkering up the cases, until he converted the 12,000 into 10,798 cases, thus rendering it impossible for him to tender the full quantity of cases, according to his contract with the defendants. In taking that course the plaintiff had not acted wisely, for he hoped to establish that it was a principle of law, that a man was not bound to take a less quantity of goods than he was entitled to have by his contract. In support of that he referred to Benjamin on Sales, page 568, and cited the cases of *Oxendale v. Wetherall*, in vol. 9 of *Barnwell and Cresswell's reports*, page 386, and that of *Morgan v. Grath*, 34 L.J., *Exchequer reports*, page 165, and in addition read an extract from *Leeke on Contracts*, page 437. There was not the least doubt it was a proposition of law that a man was not bound to take less than he contracted to have, and the only way to get out of it was to establish some kind of custom to show that though the purchaser contracted to buy a certain number of cases, he was not expected to take them, but to take only what the seller offered him. There was an assertion in this case that it was the custom of the trade in Shanghai to fill up leaky tins. It contemplated a certain amount of leakage no doubt. I admit that it does, but I shall be able to prove that the amount of leakage contemplated was only the ordinary percentage, and plaintiff's own witnesses have put it down at a half or three quarters per cent., but I shall say it is from one to two per cent.

I take it that it is an undoubted principle of law, that a man is not bound to take less than he buys, and that it is a good defence to this action. I apprehend, also, that in the kerosine oil trade of Shanghai, if a purchaser buys 12,000 cases and is only offered 10,000, that he is not legally bound to take them; or, to carry it further, that he is not legally bound to accept one less than he contracted to have, that is, as a principle of law. A less number might be received for convenience, but I shall prove that it was most inconvenient for the defendants that they could not get the full number they contracted for.

MR. MOWATT. (Acting C. J.) to the Jury. I shall ask you, gentlemen, as I intimated during the speech by Mr. Wainwright, to put out of your minds everything that you have heard about the *Golden State* cargo, because, after consideration, it seems to me that it has at the most so slender a bearing on the case that it will be safer to discard it from your minds altogether. As I understand it, it is introduced with this view. Plaintiff says, You will see from what occurred in the matter of the *Golden State* cargo, that Mr. Wilson was not really anxious to buy oil at all, otherwise he would not have refused to take it because it was a few minutes late in being put into the godown, and you may infer from this that he was not very anxious to buy the other cargo, and consequently he has thrown it over, not because he considered it unsound and deficient, but really because he was not anxious to buy. I think you can place so little reliance upon inferences of this kind, that it would be much better to confine your attention altogether to the cargo that is the subject of the suit. Now, the first question you will have to consider is this—Has the plaintiff substantially performed his part of the contract? For, unless he has done so, he cannot come into Court and ask that the defendants should be compelled to perform theirs. The defendants' case is that the plaintiff has not performed his contract in three essential particulars, and if you should find that he has failed in any of the three, then you must give the defendants your verdict. The three particulars that the defendants say the plaintiff has failed in, in respect to the contract, are these:—First, in the matter of the quantity of the goods he contracted to supply; next, in the matter of the quality of the goods; and, lastly, in the matter of the time at which he contracted the goods would be ready for the defendants. Now, I will take these three points separately, and then ask you to consider the evidence upon them, and the plaintiff's answer to the

various objections. The first, no doubt, is the crucial one, that the quantity of the oil was not what he undertook to supply. By the contract 12,000 cases of oil were to be supplied, with the proviso that damaged and leaky cases were to be allowed for. What is the cargo that the plaintiff brought to the port to fulfil that contract? He brought 12,000 cases of oil, all of which were damaged—damaged in the sense that I understand the word to apply in this case, that is, they were all oil-stained—and 57 per cent of those 12,000 cases were leaky, and leaky to the extent on an average of nearly one-fifth of each case. So we have a contract to supply 12,000 cases of oil, subject to an allowance for damage and leakage, and we have 12,000 cases offered all damaged, and 57 per cent of them leaky and badly leaky. Then, the question is—Does that cargo sufficiently satisfy the requirements of the contract? This makes us look a little more closely at the language of the contract.

You have had the views of four merchants as to how they would understand a clause of this kind in their own business; and they have all told you with one accord that they would understand it as contemplating only the usual percentage of leakage. It has been urged by Mr. Robinson that the construction of the contract is for me, and, if it is so, as I think it is, the construction I put upon it is the same. We cannot suppose it was in the contemplation of the parties that the plaintiff should be at liberty to supply the defendants with 12,000 leaky or damaged cases. A good deal of stress has been laid on the word "rejected" having been struck out of the contract. The printed form is "damaged goods to be rejected", and in place of that is inserted the term "damaged and leaky cases to be allowed for in godown." The effect of the alteration is this—it makes a difference only in *how* damaged and leaky cases are to be dealt with, and does not at all affect the extent to which unsound cases may enter into the quantity contracted for. If the word "rejected" had stood, the purchaser would have been entitled to reject the damaged cases. By the alteration he was not at liberty to reject them; he had to take them at an allowance. But, in either case, they must not form an unreasonably large proportion of the original quantity. Now the cases were all damaged and 57 per cent of them leaky, and I ask you whether you consider that a sufficient performance of the plaintiff's contract? I have said the cases were all damaged. We have the receipts of the cargo put on board at Hongkong; there the cases were signed for as in bad order. Then there are the godown receipts, and they say that the cases were all oil stained. I think, then, that these facts, coupled with the offer of 10 per cent all round, and that plaintiff has received an allowance of from thirty to forty cents all round, and the fact that the so-called sound cases brought to Court have actually leaked while they have been here, puts the condition of the cases beyond all doubt. The question then for you first to consider is—Was that a reasonable performance of his contract? If you think it is not, then it will be your duty to find a verdict for the defendants. I think it would be convenient if you could answer that question at once, so please consider it.

MR. ROBINSON: I submit that this is a most irregular way of proceeding.

HIS LORDSHIP—I propose to put it to the Jury in this way; I see no objection to doing so, and it may be simpler for the Jury and myself.

MR. ROBINSON—I must ask you to note that I object to this course.

MR. WHEELLEY (who acted as spokesman for the Jury)—What is the question, my Lord?

HIS LORDSHIP—Whether the plaintiff has substantially complied with his contract in bringing to Shanghai and landing 12,000 cases of oil, in the condition I have described them to you?

MR. WHEELLEY (after the jury had deliberated a short time.)—We are all of one opinion, that he has not fulfilled his contract.

HIS LORDSHIP—That is, so far as quantity is concerned.

MR. WHEELLEY—Yes.

HIS LORDSHIP—The next objection the defendants have offered is, as to the quality of the goods. The law is thus stated in the case of *Jones v. Just*—"In every contract to supply goods of a specified description, which the buyer has no opportunity to inspect, the goods must not only, in fact, answer the specific description, but must also be saleable or merchantable under that description." The

question on this part of the case is thus one of degree, namely, were the goods in your judgment fairly and reasonably saleable as Devoe's Kerosine Oil? With regard to the oil itself, there has been no fault found; but the cases, as we have seen and heard, were in very bad order; and it is urged on behalf of the defendants that in this kind of goods the cases are an intrinsic part of the commodity, and that you cannot treat the oil as distinct and apart from the cases in which it is contained. In one of the authorities cited, the Judge said he could conceive cases where the state of the receptacle might justify the goods being rejected. But that evidently applies to exceptional or extreme cases. Of course some goods will sell as well in one kind of receptacle as another, but whether that is so with this kind of oil in this part of the world, you probably will know from your own experience. The witnesses have said that the cargo was not marketable, but they qualify it by saying that they could sell it at a reduction.

It is solely a question for you, as a Jury, to consider from what you have heard whether the oil was or was not fairly and reasonably marketable. I will read to you what was said in the Manila hemp case [Jones v. Just. L. R. 3 Q. B.—197.] The Judge in that case said:—"I think that the question is for the Jury, whether what was supplied under this contract was, when shipped at Singapore, such as to answer the description of *reasonably merchantable Manila hemp*, that being the warranty which, I think, the law implies in a contract to supply, as this is, though it would be different in a sale of specific things which the purchaser might examine, or of things sold by sample. And I think the question whether it is fairly and reasonably merchantable, is a question of more or less, which must be left to the Jury as reasonable men to determine." And that is how I shall leave the question of the quality of this oil to you. Do you, as reasonable men and men of business, say that this oil can be fairly and reasonably taken into the market and be sold as Devoe's Kerosine Oil? Then the third ground of objection, upon which the defendants say that this contract has not been sufficiently performed by the plaintiff, is as to the delivery, the time at which he, the plaintiff, should have delivered the oil. The contract says "that delivery should be one month after landing, buyer to have option of taking godown order, seller allows one month's discount." Now the landing commenced on the 27th November, and finished on the 4th December. Then I take it that at that time the defendants were at liberty to have the cargo if they chose. Now, "taking godown order" is a little ambiguous, but you can bring your own knowledge to bear on it, and if it is for me to form my view of it, I take it that the defendants were entitled, as soon as the cargo was landed, that is, on the 4th December, to have it if they chose. Defendants were in treaty at the time to ship cargo to Japan, cargo of the kind that was specially fitted for Japan, which this cargo was, being screw topped tins, and it may well be that they wanted this particular cargo to send to Japan. But at that time we know the cargo was not in a condition to be handed to them, because we have been told that the repairing and refilling went on until the 10th December. I have now placed before you the three objections made by the defendants to the manner in which the contract has been performed by the plaintiff. They say, first, you have not given us the proper quantity; next, you have not given us the proper quality; and, lastly, you have not fulfilled your contract in regard to the time you were to deliver the cargo. As to the proper quantity, if you take it as a question of the oil tendered, apart from the number of cases, there was a deficiency of 10 per cent. Now that is a deficiency which, so far as the evidence goes, is very largely in excess of the largest that has been known. One witness put it, I believe, as high as 5 per cent, and others said it was 1 and 2 per cent, but I think you will have little difficulty in concluding from the evidence that it averaged from 2 to 3 per cent, and in this case you have it at 10 per cent—tested by the quantity of oil.

Mr. ROBINSON.—It was not largely in excess of the *Star of the West* cargo.

HIS LORDSHIP.—In the *Star of the West* cargo there was only 5 per cent leakage, and in this case it amounts to 10 per cent. You have already found, gentlemen, as I understood, that plaintiff did not perform his contract as to quantity, looking at it from the question of the number of

cases and the condition in which the cases were in. I ought at the time to have asked you, putting the question of the cases aside, whether the amount of oil itself was sufficient to constitute a reasonable performance of the contract. If plaintiff was at liberty to refill the tins, then there was a percentage of ten per cent short, and the evidence shows that a reasonable percentage is from 2 to 3 per cent. The first question then you will have to answer is as to the quantity. You have already answered it as to the cases, and I will put it to you again with regard to the oil. You are first to consider whether plaintiff has substantially performed his contract as to the quantity as tested by the cases or the oil in them; secondly, as to the quality of the goods; and, lastly, as to the time of delivery. If you find on any one of these three points against the plaintiff, he is not entitled to recover.

In reply to the questions put to them by the judge the jury found. 1st. That the plaintiff had not substantially complied with the conditions of the contract, as to the quantity of the oil. 2nd. That the plaintiff had not substantially complied with the conditions of the contract as to the quality of the oil, the cargo being too far short of sound to be marketable. 3rd. The plaintiff had complied with his contract as regards time.

On these findings, judgment was given for the defendants.

IN H. B. M.'s COURT AT KANAGAWA.

Before H. S. WILKINSON ESQ. ACTING LAW SECRETARY.

REGINA (on prosecution of the *Imperial Japanese Customs*.)

JOHN HARTLEY.

Mr. Lowder for the Prosecution.

The Defendant appeared in person.

The defendant was charged on summons with smuggling or attempting to smuggle on the 8th day of January last into the port of Yokohama, twelve cetties of opium, not being medicinal opium and being prohibited goods. And also with having on the same day and at the same place landed from the British ship *Malacca* a case of goods containing gum, and twelve cetties of opium not being medicinal opium, without having been duly entered at the Japanese Custom House as provided in Regulation III of the Trade Regulations appended to the treaty between Great Britain and Japan of August 26th, 1859, and contrary to the stipulation in Regulation II of the said Regulations; and he was called upon to show cause why the said case containing 221 lbs. gum and 12 cetties of opium, the same not being medicinal opium, should not be confiscated.

It was proved that Mr. Hartley on the 8th of January, applied for a permit to land some goods, among which was a case numbered 251, said to contain gum: in this case were two tins, found to contain opium in powder. Samples taken from these two were submitted to Dr. Geerts, the analyst in charge of the laboratory to be analysed: and subsequently by order of the Court, samples from these two tins were analysed by Mr. North a druggist carrying on business at No. 61 Yokohama. The following is the result of their analyses.

Dr. Geerts, sworn, said:—I am a Dutch subject, and medical officer of the Dutch army, now residing at Yokohama. I remember receiving from Mr. Lowder two envelopes on the 29th of January. At the request of the Superintendent of Customs I analysed the contents of the envelopes, to ascertain the quantity of morphine. One only contained 4/10 per cent morphine. Besides, I found the opium had a very bad colour and very bad smell. The range of morphine in Turkish opium goes from 15 per cent to 7 or 6 per cent, but the average is considered above ten per cent when in a powdered state. Six per cent is the very lowest. The morphine contained in Indian opium is much less than in Turkish. The middle per centage of morphine in Indian opium is less than the middle quantity in Turkish opium. The per centage may vary from half per cent to six or seven per cent, which is the very highest. Some chemists say they have seen Indian opium without any morphine. Opium may be used as a medicine. Its essential and chief principle as a medicine is morphine. I have made myself acquainted with the different qualities of opium by the

Principal Pharmacopœia in Europe. By reference to them, I can ascertain whether opium is fit for a medicine, as the fitness of opium for medical use is from the quantity of opium it contains. The standard of morphine required to be in powdered opium by the British Pharmacopœia is not less than 8.33 per cent or $1\frac{1}{2}$ part of morphine. The French pharmacopœia requires from 10 to 11 per cent of morphine. The American 10 per cent. The German also 10 per cent. The Dutch 9 to 12 per cent.; and in Japan we have adopted from 9 to 12 per cent. The technical name of opium which requires the amount of morphine just mentioned is "official opium." Medicinal opium is the popular expression for "official opium." The opium in those envelopes certainly would not come under the name of official or medicinal opium. I cannot say positively where that opium is produced, but I believe, on the ground of the small percentage of morphine, and the colour, and the particular smell, which is different from Turkish opium, that it is Indian opium. But wherever it comes from, it is a very bad specimen of opium, which would cause it, in Europe, if found in an apothecary's shop by an Inspector, to be confiscated; and the apothecary would be punished. If this opium were administered to a patient it would have a different effect than intended.

To Mr. Hartley:—That is not medicinal opium. I did not put the two samples in the same vessel. I analyzed them myself. They were analyzed twice.

Mr. Hartley:—You are an officer of the Government?

Dr. Geerts:—Your Honour, I came here as an expert and to answer questions concerning the opium, and I do not wish to answer any others.

His Honour:—So far nothing has been asked you that is not relevant. I will see that you are not asked any improper question.

Witness:—It is quite possible that a medicine may stand on the limit of purity, that it may be called good by one laboratory and bad by another.

Dr. Geerts declined to answer another question put by Mr. Hartley, when His Honour explained to him that if he refused to answer, his evidence would have to be struck out. The witness did not see what the question had to do with the result at issue. However, he would waive his objections.

Further cross-examination failed to elicit anything material.

To His Honour:—The hundred grains of opium referred to in the British Pharmacopœia is crude opium. Chandon is a preparation made by the Chinese from opium imported from India. They heat the opium until they get a strong watery solution, which they filter, and which is then evaporated in a copper vessel until it becomes nearly dry. Then the extract is heated a little more, so that it is more or less roasted and has a peculiar smell. This is then called chandon or smoking opium. It is mostly Indian opium which is used for this purpose, though the Chinese use other opium. Indian opium is however preferred notwithstanding that it has a less percentage of morphine. The Indian opium is softer than Turkish opium. The quantity of morphine in opium does not render it more acceptable to the Chinese; in fact they prefer it to contain the lesser quantity of morphine. I can see no difference in the opium contained in those tins to the opium in the envelopes. I have been obliged to return opium as unfit for medical use, and I believe that all those parcels came from India. The appearance of that opium differs from Turkish opium, as the colour is different and the smell is not so agreeable, if opium may be said to have an agreeable smell. Every medical man would refuse to accept Indian opium for medicinal purposes. The balls of Indian opium are darker than Turkish opium.

Mr. John North, sworn, said:—I have made an analysis of the two samples of opium, which I took from those tins marked A and B. I found in sample A $1\frac{8}{10}$ per cent. of morphia; in sample B $4\frac{1}{10}$ of morphia. I did not look for foreign matter, as I only desired to discover the percentage of morphia. It was a hundred grains of opium I analysed from each tin, and I compared the samples taken from the Court with Smyrna opium as to colour only.

To Mr. Lowder:—I have made a very careful analysis of the opium; it took just a week to do it. The process I adopted was according to the British Pharmacopœia. I believe the result I have arrived at to be absolutely correct.

I would not like to say that the result I have obtained was necessarily more correct than the result obtained by Dr. Geerts. I have on one occasion applied to Dr. Geerts to analyse a sample of opium. I was already analysing a sample of the same opium at the time. Dr. Geerts' was $2\frac{4}{10}$ and mine was $1\frac{8}{10}$ of morphia. I trusted most in Dr. Geerts as he has better means of obtaining a correct analysis than myself, and more time too. Different processes of analysis may give different results, even of the same article. Therefore I am not prepared to say that my analysis is correct, and that Dr. Geerts' analysis is incorrect. Supposing the opium powder had been of a bad quality the impurities would not interfere with the test; the same bulk of pure opium would contain a large amount of impure, or rather more morphia would be found in a good sample of opium than in a bad sample—impurity cannot be applied to opium. I did not look for extraneous matter, though I noticed colouring matter in both samples, though there was more in sample A than in sample B. It would be the usual resinous extract; though if there had been any colouring left after my analysis it would have shown in the drying. Washing morphia with chloroform would destroy any impurities if they existed. I did not wash the morphia obtained by me with chloroform, but with ether. Morphia as it is usually made is of a light brown colour: but in its perfectly pure state it is white, but to get it to that colour it would have to go through three or four crystallizations, which would lessen the quantity. I am not acquainted with Jacobson's process of obtaining morphia. I qualified as an analytical chemist, but have no more diploma or certificate than is possessed by any other druggist and chemist. All druggists and chemists are not now authorized to make analyses, though they used to be at one time. A chemist may become an analytical chemist by passing an examination. I have not passed through such an examination. I have been eleven years in Japan.

Re-examined by Hartley:—I am not personally acquainted with any analysis of Dr. Geerts being incorrect. The process mentioned by the British Pharmacopœia extracts the colouring matter and narcotine. I do not know of any law forbidding me to analyse any article.

To the Court:—I cannot explain the difference between my analysis of sample A and Dr. Geerts' analysis. I made mine with the greatest of care. It would be impossible to reduce the $1\frac{8}{10}$ to $1\frac{1}{4}$ of morphia by extracting the impurities. By crystallizing and recrystallizing the $1\frac{8}{10}$ might be reduced in weight by $1\frac{1}{500}$ th part of a grain. The process of analysis in the British Pharmacopœia dissolves the morphia and leaves the other alkaloids undissolved. Chemically all analyses of opium should give the same result; but chemists differ in their opinions. By following one process more than another, I should not necessarily obtain a different quantity of morphia. I have not an elaborate laboratory, but I had all the necessary materials for conducting this analysis. It is not possible that any process of analysing would have found as much as six per cent of morphia from the sample from which I obtained $4\frac{1}{10}$. I do not conduct analyses frequently, as I have no time to attend to them. I have at times conducted analyses, and sometimes made mistakes like all other chemists are liable to. It is very seldom that two analyses turn out alike. Personally I cannot say that opium is introduced into Japan for the manufacture of morphia which is usually extracted from the lower kinds of opium. There might be such a manufactory without my knowing it. Laudanum is made from opium of good quality, the same as I should use in a crude form for medicine. One of the samples (B) I analyzed had a very nasty smell, and had not that agreeable flavour which Turkey opium has. Sample A was not so good as Turkey opium. I should know by the smell of B that it was not Turkish opium. Opium of bad quality has a dark colour, which is a fact generally known. Sample B is a fair colour, while sample A is bad; though B is not up to Turkey opium. I could not make laudanum from that opium. It might be possible to make it the same strength as official laudanum, though it would be a different preparation.

It was also shown that during the year 1877 there had been a great demand for opium among the Japanese druggists. Mr. Hartley also proved that the invoice cost of this opium which he had ordered from a first rate house in Calcutta was \$7.68 (£1.8.9½) per pound, while cost of Malwa opium was \$5 per pound.

On the 7th of April, the following judgment was delivered by Mr. Wilkinson.

After reading the charge against the accused, his honour said :—

The charge of smuggling and of attempting to smuggle is brought under the last paragraph of Regulation II appended to the Treaty between Great Britain and Japan of the 26th of August, 1858, and Section 84 of the China and Japan Order in Council, 1865. There was another charge of smuggling opium recently brought against the same defendant under the same paragraph of the Regulation, which was dismissed by this Court, on the ground that the opium which formed the subject of the charge was medicinal opium, and that the prohibition in the Regulation did not apply to medicinal opium. In this case, however, it is alleged that the opium which forms the subject of the charge is not medicinal opium, and I think that this allegation is fully borne out by the evidence. The proportion of morphia found in it is sufficient to determine that point. I find that no opium can properly be called medicinal opium unless it contains at least six per cent. of morphia, and the evidence of Dr. Geerts and of Mr. North, by both of whom the opium in question was analysed, shows that the proportion of morphia in it, falls far short of that standard. The difference between the result of the analysis made by Dr. Geerts and that of the analysis made by Mr. North is certainly startling. There can be no doubt whatever of the good faith and ability of both these gentlemen, and yet the opium which the former found to contain only fourth-tenths per cent. of morphia, was found by the latter to contain one and eight-tenths per cent., and another parcel which the former found to contain only two per cent., was found by the latter to contain four and one-tenth per cent. It is difficult to understand how such different results could be obtained. But it is not necessary to reconcile the difference, as I am satisfied that no analysis would show the opium in question to be up to the lowest standard necessary for medicinal opium.

But not only do I find that the opium in question is not medicinal opium, I find that it is smoking opium. The evidence of Dr. Geerts shows that the opium used in China for smoking is mostly Indian opium. The Chinese use other opium, but the opium which specially commends itself to them is Indian opium. The flavour of Indian opium which renders it less palatable as medicine, renders it all the more palatable for smoking, and the absence of morphia, which makes ordinary Indian opium useless as medicine, is no disadvantage for smoking; if it is not a distinct advantage. Now, not only is the opium in question Indian opium, I find that it has the characteristics which distinguish Indian opium from Turkey opium, and which commend it for smoking, and that there is a want in it of that characteristic which makes opium valuable as a medicine. In only one respect does it differ from the ordinary Indian opium of commerce, it has been reduced to powder. But that has failed to disguise it, and I think it is satisfactory to find that the characteristics of smoking opium are so pronounced as not to admit of being easily disguised.

I find then that the opium in question is the opium contemplated in the Regulation, and I find that it has been smuggled. The evidence is clear upon the latter point. No serious defence has been raised, and the defendant must pay the fine of \$15 a catty on all the opium in question, which I find to be eleven catties. The fine will therefore be \$165, and it must be paid forthwith.

It is enough for this case that the opium which forms the subject of the charge has been proved to be smoking opium, but it may be desirable to point out some of the general conclusions to which the evidence leads. I think from the evidence in this case we may be safe in laying down with very little reservation that Smyrna opium containing six per cent. of morphia or more, is certainly medicinal opium, and if, on the other hand, we cannot say positively that all Indian opium is smoking opium,—that there may not be a bare possibility of opium being grown in India with all the characteristics of the Smyrna opium which we find to be medicinal opium,—yet it has not been shown that there is any opium grown in India which has all those characteristics, and in the absence of the most positive evidence as to the coincidence of the characteristics of any particular parcel of opium, with those of Smyrna opium, the fact that it is Indian opium

will be sufficient to justify its condemnation as smoking opium.

Evidence has been given as to other sorts of opium, but it will be time enough to deal with them when the occasion arises.

As to the claim to have the case and its contents confiscated, I am of opinion that it cannot be sustained. It is founded upon the third paragraph of Regulation II and the first paragraph of Regulation III. The first mentioned paragraph provides :—

“Any goods that shall be discharged or attempted to be discharged from any ship without having been duly entered at the custom House as hereinafter provided, shall be liable to seizure and confiscation.”

The provision here referred to, which is contained in the last mentioned paragraph, is as follows :—

“The owner or consignee of any goods who desires to land them, shall make an entry of the same at the Japanese Custom House. The entry shall be in writing, and shall set forth the name of the person making the entry, and the name of the ship in which the goods were imported, and the marks, numbers, packages and the contents thereof, with the value of each package extended separately in one amount, and at the bottom of the entry shall be placed the aggregate value of all the goods contained in the entry. On each entry, the owner or consignee shall certify in writing that the entry then presented exhibits the actual cost of the goods, and that nothing has been concealed whereby the Customs of Japan would be defrauded, and the owner or consignee shall sign his name to such certificate.”

It is admitted that the gum now sought to be confiscated and the case containing it were entered at the Custom House in accordance with the Regulation, with this exception, that the whole of the contents of the case were not set out, and the total value of the contents of the case was wrongly stated. The quantity and value of the gum was rightly stated, but it is contended that in accordance with the Regulation the quantity and value of the opium ought also to have been set out, and that, inasmuch as the quantity and value of the opium in it was not set out, the case and all its contents are liable to be confiscated. But I am of opinion that the paragraph which provides for the confiscation of goods unless they were duly entered contemplates only goods which were capable of being duly entered. As all the goods which were capable of being duly entered were so entered, there can be no confiscation under this provision. If there were a provision concerning goods intended for importation such as there is, in the seventh paragraph of Regulation III, for goods intended for exportation, there could be no difficulty in the matter; for it is expressly provided with regard to these goods that “all packages which contain prohibited articles shall be forfeited to the Japanese Government.” But there is no such distinct provision with regard to goods imported, and there is no other provision under which the package as a whole can be confiscated. Mr. Lowder very rightly admits that it is not subject to the 4th paragraph of Regulation II which provides that.

“Packages made up with intent to defraud the revenue of Japan, by concealing therein articles of value which are not set forth in the invoice, shall be forfeited;”

for, the opium being absolutely prohibited, there was no fraud on the revenue. The defendant is therefore entitled to have the case and the gum delivered up to him.

With regard to the confiscation of the opium, the only provision applying to it is the first clause of paragraph 8 of Regulation II.

“The importation of opium being prohibited, any British vessel coming to Japan for the purposes of trade, and having more than three catties weight of opium on board, the surplus quantity may be seized and destroyed by the Japanese authorities.”

This opium came in one vessel, and, with the exception of three catties, the Japanese Government is entitled to have it destroyed. With regard to the three catties I cannot help expressing my regret that for a case such as the present no provision has been made for its confiscation. But, as I read the Regulations, there is none, and the defendant will consequently be at liberty to re-export it. The order, therefore will be that all the opium in question, with the exception of three catties weight thereof, shall be destroyed by and in the presence of such officers as the Superintendent of Customs shall appoint; and that as to the said three catties weight, the same shall be held by the Japanese Customs until the defendant shall give proper security to the Superintendent for the re-exportation of the same.

stead of appearing, from the back of the bench, like a 'Jack in the Box.' And essentially and utterly wrong, was his delivery of his solo from the footlights, instead of his proper seat. We may be told that he could not make his voice tell from the back of the stage: we reply, that a canopy, or a sounding board, or a ceiling to the scene, might have been used as aids to his vocalization (and we are surprised that one of these obvious expedients did not suggest itself to the stage-manager.) But we have also to tell Mr. Pearson that, for the delivery of a solo, obviously a plagiarism on the 'Ratcatcher's Daughter,' and with no music in it whatever,—nothing but patter and pantomime, it was utterly indifferent to the audience whether they heard his voice or not; and that his admirably comic by-play and splendid mobility of feature would have told with far more effect from the Bench than they did from the front of our small stage. But Mr. Pearson has done so much for the entertainment of Yokohama during his residence amongst us, that we can easily forgive one *fiasco*, and as a veteran actor, he will appreciate the value of our criticism, and doubtless, on some other occasion, turn it to account.

Our best acknowledgments are due to the Conductor, who magnanimously refused to accept any remuneration for the great amount of valuable time given by him to the preparation of this piece. He is a true artist; witness the instance of rare self-abnegation which he displayed last night.—at one moment we find him playing that most thankless instrument, the Contra-bass, in a set of waltzes, the next, taking his place as Musical Director. We commend his example to those amateurs who are too great for their parts and who imagine themselves competent to change a composer's ideas to suit their own private ends. Our hearty thanks are also due to Dr. Goertz, who obligingly stepped in at the last moment to help fill the gap caused by the absence of the Band. And especially, in conclusion, to Capt. Bridgford the stage-manager, who has lent the aid of his very large experience in such matters to the drilling of so large a company. Its effective display on so very small a stage is the best proof of his ability, and the success of the piece being due in so great measure to his firm management, tact, and knowledge of stage-business, to him is due a large share of our applause.

(Owing to an accident in our office, this number of the *Japan Times* is not published until to-day, Monday April 15th.)

THE TIMES OF TAIKO.

(FROM THE JAPANESE.)

BY F. BRINKLEY, CAPT. R. A.

ISHIKAWA GOYEMON.

Chapter XV. FOREBODINGS.

"It cannot be, Bansaku," said the Minister, when the Comptroller had reported the result of his visit to Ishikawa. "There is no precedent for such an extraordinary appointment. Even if the Emperor's consent were obtained, the nobles would surely consider themselves insulted."

"Pardon me, your Excellency," the comptroller answered, "if I say that these scruples seem a little inconsistent with the design we have in hand. When your Excellency's voice is absolute in the empire, who is he that will dare to criticise the rewards you bestow on your servants? Will it not suffice that you have found merit warranting such favour? Moreover, your Excellency may be assured that those who know Ishikawa Goyemon will easily reconcile themselves to his promotion, however high it raise him, and should any demur," added Bansaku with a significant smile, "Goyemon will find means to persuade them without appealing over much to your Excellency's patronage. A little thing can turn the arrow from its mark, and many a great result has been jeopardized by too close a scrutiny of process. Would to heaven there were nothing more deterrent in the details of our enterprise than this condition!"

"You are right, Bansaku, and henceforth I place the conduct of this business entirely in your hands. I hope that my power will one day reach as far as my gratitude desires," said Hidetsugu, acquiescing gladly in the passive rôle his servant's zeal assigned him, and not uninfluenced by the reflection that, his purpose once attained, the destruction of the tools he had employed would be no less possible than prudent. Could he have seen into Bansaku's heart, his contentment might have been a little disturbed, but he was too indolent to analyse the motives that had transformed the comptroller's reluctance not merely into assent, but assiduity.

The truth was, that Bansaku's conception of a vassal's duty comprehended much more than the common creed of his contemporaries, which taught that faithful counsels thrice re-

jected solve the bonds of service. They offer, he held, an example of selfishness rather than devotion who, seeing their influence powerless to avert evil, abandon their posts, and by a self-inflicted exile or death protest against what they cannot prevent, for since the ties of true fealty are indissoluble, a vassal is only faithful when he is prepared to embrace the policy he has failed to modify, and share to the bitter end the disasters and disgrace of his master. Yet one solace this chivalrous man had reserved in secret for himself: it was his fixed purpose, after he should have achieved Hidetsugu's behest, to follow Taiko at once to the grave, and in the realm of the shades solicit his old master's forgiveness. This was all the reparation he could offer, and being all, would, he believed be sufficient; for the consciousness that he himself would freely pardon any evil suffered at the hands of one similarly constrained, made him quietly confident of finding no less magnanimity in his neighbours.

Having received the Minister's consent, Bansaku at once conducted Ishikawa to the palace and into his master's presence.

Hidetsugu was seated on an elevated dais in the foreground of a fair receding vista of exquisitely pictured arras and damask canopies. As a mark of special condescension, the curtain that served to conceal him from the gaze of inferiors on ordinary occasions, was raised sufficiently to show his features, than which none handsomer or more dignified might be found in those days among the rulers of Japan. Goyemon, impassive and disdainful as his habits had made him, could scarcely conceal his astonishment at the magnificence of everything he saw around him, and for the first time in his life perhaps, bowed his head with a feeling of genuine submission.

"Ishikawa Goyemon," said the Minister, "at my comptroller's recommendation I have decided to admit you to my service. It gratifies me to see your zeal in my behalf."

Goyemon smiled in his heart at this form of salutation. Nevertheless, abating nothing of his humble deportment, he replied with becoming obeisance:—"Your Excellency's condescension and the most unmerited honour of this interview, overwhelm me with gratitude and reverence."

"Your petition," resumed Hidetsugu, "has been made known to me, and has obtained my sanction. You shall presently receive the insignia of the office you desire. Meanwhile Bansaku will furnish you with the details of the duty required of you."

At a sign from the Minister, the chamberlains and other officers present then withdrew, and Bansaku, coming close to Goyemon, said:—"There is in the castle at Fushimi a piece of porcelain known as the Lapwing-censer. It originally belonged to the Chinese Emperor, Taisho, but afterwards, coming into the possession of the Imagawa family, was presented by Ujizane to Ota Nobunaga, and at his decease fell into the Regent's hands. In addition to its extraordinary beauty, it is endowed with certain miraculous properties which render it one of the most curious and valuable specimens of art in the kingdom. My master has long wished for this censer, but the Regent refuses to give it to him, for no better reason than an alleged fear that it might pass into the possession of some lady of His Excellency's household. Inconsiderate as this plea is, my master would be content with it, had he not openly mentioned his intention of asking for the censer, so that he is now constrained to suffer a public slight, or take other means of obtaining what he desires. I myself would willingly undertake the duty of abstracting the censer from the castle, but the Regent keeps it always beside him, and if anyone approaches his couch after night-fall, the Lapwing immediately gives the alarm. I have heard you say that your art includes a secret available in such cases. If this be so, and if you will make the attempt, I promise you in His Excellency's name that so soon as you deliver the censer into our hands, the office you aspire to shall be yours."

Goyemon, too astute to analyze reasons that did not concern him, was careful to receive this statement with every appearance of good faith. "I do indeed possess a secret, Sir Bansaku," he said, which would enable me to execute His Excellency's commands, did I not unfortunately lack the one article upon which success depends, and I fear that even the palace resources will be unable to supply it. I myself have sought it for many a year, but hitherto without any result."

Bansaku laughed ironically at this speech. "It must be something rarer than even the Lapwing-censer, Goyemon, if the Prime Minister's hand cannot reach it. I think you may dismiss all doubts upon that score."

"Nevertheless I am still incredulous," answered Goyemon. "It is very well known that all the crimson brocade in Japan might be measured by inches, and when I tell you that I need a sufficient quantity to wrap completely round the censor, you will, I think, admit the formidable nature of this difficulty. However, if it be overcome, I promise you that the Lapwing will suffer itself to be carried out of the castle without a single cry."

"Your method sounds strange," said Hidetsugu, "but none the less admirable if it be efficacious."

"Your Excellency" replied Ishikawa, "it is the one secret of my art that neither reward nor affection has ever induced me to divulge. As for my belief in its efficacy, I can offer no better proof than the risk of my life, certainly forfeit if I fail. And to this," he continued solemnly, "I add an oath that no torture cruelty can devise shall wring from me a confession of the commands I obey."

These words were uttered with an air of noble confidence that showed they were no idle boast, and Hidetsugu, looking admiringly at the speaker's stalwart frame and fearless eye, felt his cause doubly strong in the hands of such an ally. Rising, he left the room, and returned presently, carrying with his own hands a small ebony chest, gold-clasped and carved into clusters of flowers and groups of birds. From this he drew an article that well merited Ishikawa's start of astonishment and delight, for it was nothing less than a tabard, formed of a single piece of brocade, and bearing on the back and skirts an ample figure of the sovereign* of the three hundred and sixty birds, exquisitely embroidered in gold thread. The sunbeams, recognizing a kindred beauty in this rich fabrication, seemed to cling about it and caress it as it emerged from its case, till each of its folds glowed and sparkled with an almost dazzling brilliancy. Hidetsugu handed it to Goyemon, who received it with reverent admiration, but Bansaku shuddered and turned away his head, for in the mystic bird's golden plumage shining out from its deep crimson environment, he discovered an emblem of the bloody setting that surrounded the diadem his master sought.

"Goyemon," said the Minister, "if crimson brocade possess any such virtue as you describe, that tabard cannot fail to serve your purpose, for it belonged once to the Emperor himself, and has covered the armours of no less rulers than Nobunaga and Taiko."

"Your Excellency," answered Goyemon, "the ruler it will now help to establish is not less than any it has hitherto served."

The Minister started at these words, for they showed that Ishikawa had penetrated his real design, but Bansaku observing his master's discomposure, hastened to suggest a new topic.

"Now that you are provided with what you need for the achievement of your purpose, Ishikawa," he said, "it only remains to consider the preliminaries, and of these the passage of the castle gates is, I suppose, the most important. Do you desire a permit from his Excellency, or how do you propose to act?"

"I desire nothing but His Excellency's confidence, Sir Bansaku," replied Goyemon. "The more thoroughly you entrust to me the details of execution, the more entirely unshared will be the responsibility."

"Nevertheless you will allow me to ask you one question," persisted the comptroller. "What course do you intend to follow in the event of failure?"

"In the event of failure," answered Ishikawa, "I propose to assume the character of a robber, and I promise you," he added with a smile of which subsequent events interpreted

* The Hocho, commonly translated "phoenix," but possessing no attribute in common with the latter, except immortality. It is fabled to have originally appeared thousands of years ago, on a mountain called Taketsu, in China, during the reign of the just emperor Fukugiehi, but when, or how often, mortal eyes have since beheld it, history does not tell. Universal peace and morality are the only conditions of life it visits, and at its advent, the 360 tribes of birds are said to follow it wherever it flies. Its form is emblematic of all that is beautiful and good. In the plumage of its wings five colours shine, and its voice is attuned to the five royal instruments (kin-sho-kaku-chi-u). It roosts only in the "Kiri" tree, eats only the sweet fruit of the "Princess Bamboo," and drinks only the purest spring-water. Its head represents virtue, its wings, docility, its back, justice, its belly, truth, and its breast, mercy. As for its form, it is said to be six feet in height, and to have the head of a fowl, the throat of a swallow, the neck of a snake, the body of the Kwocho (eagle?) and the tail of a fish, but this description does not altogether accord with the popular delineations of the bird so often seen on bronzes and porcelain.

F. B.

the import, "I promise you that I shall act the part with a tolerable semblance of reality."

It wanted still some hours of evening when Goyemon returned to his house. The enterprise he was about to undertake differed so little from many another of its successfully achieved predecessors that the arrangement of his plans cost him but very trifling consideration. A map of the Regent's castle; a pair of swords—one almost laughably long and heavy—a grapple, so constructed that its arms when released from the embrace of an iron ring, collapsed and fell together into a single-limbed hook; a long rope, slender, but hiding immense strength among its carefully plaited silk strands; a flint and steel; a black crape hood, and a huge straw hat covered with oil-paper: these constituting all the necessary accessories, their collection and examination was a matter of very brief effort.

Satisfied that nothing was lacking, Goyemon now summoned all his imagination and forethought to assist at a performance which he regarded as an essential prelude to successful enterprise, and which, in consequence, he never willingly neglected, though in truth little of the intense earnestness necessary to guarantee this proceeding against inadequacy and inutility was suggested by its method. For his habit was simply to exclude every ray of light from his room, and abandon himself to a reverie, more or less protracted according to the nature of the undertaking he contemplated; a reverie having for its object a mental rehearsal of the scene in which he was about to take a leading, or it might be, an unaided part. His great experience, added to a carefully cultivated power of forecasting the various combinations of accident and arrangement peculiar to the enterprises he pursued, imparted such a fecundity and precision to these pre-fatory conceptions, that they generally included some phase identical with the reality, and hence it resulted that imperfections due to surprise or improvidence scarcely ever disfigured his attempts.

It seemed scarcely credible that a nature in which no crisis discovered a symptom of hesitation, nor any danger, however imminent, developed a tremor of panic, should surrender itself to this tedious, nay almost timid analysis of possibility and contingency, but in truth Goyemon's whole career was guided by a desire to conciliate reputation, and though the prospect of personal peril excited in him no feeling but disdain, the fear of failure and consequent humiliation was intolerable. Never before, too, had such immense results depended on success; results which, though they were but the embodiment of a very old and very familiar ambition, seemed altogether strange and fabulous, now that they were within reach, and whether from this cause, or because the phantom of fate often crosses and troubles man's mental vision long before the catastrophe it foreshadows, his mind refused any longer to undergo the discipline of calculation hitherto so easy. It was in vain that one by one he gathered the threads of possibility and probability, and wove them into the fabric of execution, unravelling the entanglements of hazard and the knots of mischance with more than his wonted patience and care, for always when the pattern he sought to produce was approaching completion, the clew seemed to slip from his fingers, and the whole texture fell into hopeless and contemptible confusion.

At last he abandoned the attempt almost angrily, and throwing open the windows, looked out across the city towards the path of the declining sun. As he cast up the moments that separated him from the achievement of his purpose, he began to be gradually conscious of a closer relationship between himself and the life around him, a new bond of fellowship, linking him to the world he had so outraged. In this he at first unhesitatingly recognized an omen of fortunate return to the fellowship of honest men, and in the delirium of anticipation he whispered to himself fond assurances of success and unduly trivial estimates of the enterprise he had undertaken, often referring for confirmation to the tabard he held in his hand, and proudly likening his own future to the golden phoenix whose plumage glittered with a constant sheen among the shifting tints of the brocade. But he held this faith by such a frail tenure, that despite his stoutest struggles, it gradually drifted farther and farther away, and the place it left was occupied by undefined doubts and unwonted misgiving. For the very song of the ring-dove in the cedars and the whisper of the breezes among the cypress tops seemed to change, as he listened, from chants of joy into mocking echoes cast faintly back by the departing voice of happiness, and even while he gazed with new-born

affection at the tender beauties of nature, the hand of fate appeared to rise up slowly but inexorably, and draw across her fair features a cold shroud, behind which the softness of their living grace changed to the set rigidity of death before decay.

But seldom, very seldom, does instinct rightly interpret the import of that secret sympathy, that unutterable yearning by which the heart, when the sum of its pulsations is nearly told, finds itself drawn towards objects that never before possessed any power to calm or quicken its throbs, and least of all did it occur to this iron-minded man that our deep affection for the beauties among which we are born, can be stirred into the most sensitive prescience by the approach of separation and loss.

Shaking off, not without some effort indeed, the weakness that had surprised him into rapt admiration of a prospect until now little lovely, he became aware that he was no longer alone. A girl knelt beside him, timidly and with tearful eyes watching his unwonted mood. Her beauty, refined almost to frailty, was so delicately perfect that she seemed a blossom destined by nature to inhabit a world of unbroken rest; a world where no rain falls, but only dew, and flower-petals drop through the everlasting calm of the atmosphere at the very feet of the plants that nurture them. Nothing more incongruous could well be conceived than the association of such a woman with such a man; but wayward love, that delights in uniting nature's contrasts, or perhaps some provident attraction devised by nature herself to temper her own excesses, had gathered all the springs of this fragile girl's being into a deep, fathomless current of affection for the gallant, debonnaire gentleman she saw in her suitor;—and faith, a woman's faith, the most divine attribute of humanity, had consecrated her life to the reformation of the unscrupulous brigand she had found in her husband.

And whatever crimes be laid to Goyemon's charge, it must at least be admitted that he never slighted or despised the devotion of his beautiful wife. He was incapable of fully reciprocating, perhaps even of appreciating, the intensity of tenderness that glows in such a woman's pure heart, but he gave in return all that was possible to him, a strong, passionate love. And with this she was content, nay at the last supremely happy, for her gentle influence, feeble but never fainting, had drawn him slowly back from the paths of evil, until in fine he had abandoned them altogether, and retired with her to the secluded retreat where the Prime Minister's agent found him. It is very possible that the great wealth he had accumulated helped this result not a little, for in abandoning his vices he still preserved his ambition. Not, indeed, an ambition such as policy had induced him to describe to Bansaku, but one that aimed at rank and dignity for his wife's and his child's sakes no less than his own. And this ambition was now about to be satisfied. One last enterprise, easier, incomparably easier than almost any of those he had already conducted to successful issues, would bring within reach the prize he sought, and enable him to make some reparation for the years of anguish and solicitude he so often regretted to have caused the faithful girl now kneeling at his side. This was the thought that brightened his gaze as it fell upon her face, and she, responsive to his least change of feeling, smiled at him for a moment through her tears. But only for a moment, for the next, throwing herself on the ground and clinging to his knees, she burst into a storm of passionate weeping.

It may be that even as the feather-grasses tremble long before the storm comes, to rend the pine that shelters them, so the exquisitely sensitive chords of a woman's heart are sometimes stirred into prophetic vibrations, by the breath of misfortune approaching the object of her love. It may or it may not be so. All the accumulated wisdom of unhappiness fails to teach us whether such things are strange truths or superstitious fables, but certain it is that life will have lapsed very far into the twilight of time, ere it ceases to afford such instances of prescient sadness.

Goyemon asked no question, as he raised his wife and held her in his arms. He knew that she loved him too well not to have penetrated his design, and moreover, little as it had ever been her habit to trouble him with tears or complaints, her sorrow, from some inexplicable reason, seemed at that moment the most fitting mood she could have assumed.

"Chiyo," he said presently in a soothing tone:—"it is the last, the very last time, and the reward of success will restore my family to more than the dignity my ancestors forfeited. Would you have me hesitate?"

But experience had taught her that his resolutions once taken, it was idle to combat them. Without heeding his question therefore, she entreated him to describe the nature of the enterprise he was about to undertake. He did so briefly, but with sufficient accuracy to show that his projects included nothing extraordinary: carefully, however, avoiding all mention of the Minister's name. "And now, Chiyo," he added, "let me not carry with me anything so unmanly as the memory of your tears. You have always been brave in times of danger, and why should you give way now when there is no cause?"

"Goyemon," she said suddenly, raising her head and gazing at him beseechingly, "you are strong. You have never failed, and yet you doubt. Tell me, for you must know, shall we ever meet again?"

Goyemon was less troubled by this question than by the look that accompanied it, for the girl's whole soul seemed to have been absorbed into that gaze of agonized earnestness, and before he could turn away his eyes, he felt that she had discovered in his heart something of which he was himself but vaguely conscious. Nevertheless he answered stoutly:—"Most certainly we shall meet again. Everything points to success. There are no treacheries of agents or mistakes of assistants to fear in this matter, and surely his own inexperience is little likely to overthrow Ishikawa Goyemon!"

This was not said boastfully, but with a simple confidence that seemed only natural in such a man. Chiyo however did not appear at all reassured.

"Often," she said, "as you have left me with the certainty that you were about to encounter some deadly peril, I have never felt as I do to-day. The whole world, even you yourself, seem to have been suddenly separated from me by an immense interval I can never, never hope to pass, and such an utter loneliness has fallen on me that I could almost wish to die, were it only possible to be with you still after death."

"Pshaw! Chiyo," replied Goyemon, feigning an impatience he did not feel, "if a few months' rest could make me as rusty as it has rendered you timid, there might well be cause for your forebodings. Shake off your nervousness, girl, and set about your preparations, for I wish to be sure that you have reached your uncle's safely before I set out."

It was Ishikawa's habit, when about to engage in any enterprise, to send his son and Chiyo to the house of her uncle, an old priest who lived in the precincts of a little temple beyond the reach of the city's tumult. This course was dictated by a terrible necessity, for the inexorable law of those days generally included their wives and children in the punishments of great malefactors. On this occasion Chiyo had well nigh solicited her husband's permission to remain with him to the last, but she bravely refrained from doing so, reflecting that if by any chance the aspect of her misgiving awoke a corresponding weakness in Goyemon's breast, she would ill have acted the part of a true wife. With a resolution, therefore, that seemed scarcely possible in one so soft and fragile, she repressed the cruel pangs of her misery, and disposed herself to make ready for her departure, busily if not cheerfully. She would fain have protracted her preparations, and did actually, though almost unconsciously, devise not a few expedients to defer the moment of parting, but Goyemon had grown strangely anxious to hasten it. Was it that he mistrusted his own power to look any longer unmoved into those sweet eyes, childlike in their purity, godlike in their deep tenderness, or was it that the fever in his blood made him intolerant of all delay, and impatient to face danger, death, or anything that signified action? Who can say, since the man himself could not? Only when he took into his arms his sleeping son—a lusty lad, some three year old—did he seem to remember that this separation might be longer than life, for he held the child many moments after Chiyo had entered her palanquin, and when at last he placed it on her knee, he bent over her, and whispered in voice broken by emotion—if indeed such a thing were possible in Ishikawa Goyemon—"Chiyo, should you not hear from me by noon to-morrow, set out at once for Osaka, and do not return to Kiyoto while Taiko lives. Forget, if you can, that you ever knew me as I am, and remember only what I have tried to be for your sake. And, Chiyo," he added, signing to the bearers to raise the palanquin, for, with all her brave resolution, it seemed as though the trembling girl must, in another moment, fall into his arms and hide her face of convulsive anguish, "if you should care to observe my last request, bring up my son so that he may never know his father's name."

YOKOHAMA MARKET REPORT.

FRIDAY, APRIL 12th, 1878.

IMPORTS:—The speculative demand for yarns, which has been the principal characteristic feature of our import market, has for the present ceased, in the face, too, of an improvement in the value of native currency. We are of opinion, therefore, that the demand has been legitimate, resulting partly from exhaustion of stocks, and partly from the opening of new markets, a sequence of the influx of commissariat money into Kiushiu during the civil war of last year. Precisely the same sudden and apparently speculative demand for Manchester goods was manifested in India, the year after the Mutiny, when three columns of British troops had sown silver broadcast over the country. One of the great Bombay houses, in which the present writer was then a clerk, remitted, for ten or twelve mails running, an average of £120,000 per steamer, chiefly for sales to arrive. Goods were sold that had not been even made and a good part of the next year was occupied in Indian book-keepers' offices in adjusting differences in cargoes and deliveries. If *kinsatsu* continue to improve in value, as there is every prospect of their doing, and if the Japanese merchants have not over-estimated the country demand, we may expect to see the goods contracted for rapidly taken delivery of, and our year's trade will open brilliantly and soundly, with profits all round—the only satisfactory basis of trade.

There appears to be nothing doing in the Import market generally worthy of more special notice than is given in our next page of quotations and remarks. Except that we have to record a sale of 10,000 cases of Kerosine oil at a considerable fall from our last-quoted prices, and that Sugar has risen considerably, and the market is more than firm at quotations. Stocks are short with little supply coming on, and holders ask higher rates than those we quote. Metals and other sundries are dull, and prices nominal.

EXPORTS:—**SILK.** During the last week, our silk market has taken rather a better turn. The news from home having been a little more encouraging, several firms have made purchases. In all, about 500 native bales have been brought into buyers' godowns and probably much of this will be settled.

It is daily becoming more and more difficult to obtain good silk. Stocks amount to only about 1,500 bales, and much of this considerably mixed. Export to date is 20,557 bales. Prices are, nominally, \$10 to \$20 higher than when we last reported them, but as we had purposely quoted them rather full, as holders were then firm we may now leave them unchanged, with the remark that at these prices there are now buyers, whereas, before, there were none. An interesting note on the subject of the sale of the silk-worms' eggs exported on native account will be found in the next number of this Review.

TEA:—Quotations remain entirely nominal, and operations for the closing week do not exceed twenty piculs. In fact, we might report as we have done, for two or three weeks past, that the market is entirely closed. In our next issue, we hope to give our readers some slight ideas of the prospects of the coming crop.

EXCHANGE:—Transactions in Exchange during the past week have been on a very moderate scale and business has been done without change in rates; the market closes however with a higher tendency.

We quote:—London Bank, 6 months' sight 3s. 11½d @ 4s. 0d. sight 3s. 11d., Credits 6 months' sight 4s. 0½d. @ 4s. 0½d. Documents, 6 months' sight 4s. 0½d. Documents continental, 4s. 0½d. SCHOOL FOR CHILDREN IN SWITZERLAND.

MADAME A. JAQUEMOT (née Dogny) proposes to establish at Geneva, Switzerland, a Boarding School for Girls, and for Boys under 12 years of age; where they will have the advantages of a sound education and sedulous domestic care.

Boys over 12 years of age may be committed to Madame Jaquemot's charge as boarders, and parents can thus secure for them the comforts of a home, with the opportunity of attending one or other of those educational establishments for which Geneva is so justly celebrated.

Parents wishful to place children under her charge at the Pension Dogny, may address their enquiries as to terms &c. to the Editor of the *Japan Times*, who is empowered to furnish them.

A WEEKLY REVIEW OF

JAPANESE COMMERCE, POLITICS, LITERATURE, AND ART.

NEW SERIES. VOL. 1. NO. 15.]

April 20, 1878.

[\$24 PER ANNUM.]

THE MITSU BISHI COMPANY.

THE letter of Iwasaki to the *Nichi nichu Shimbun*, which we publish in our Notes of the Week, and which is virtually a Report of the business of the great native steamship line during the year 1877, is of the highest importance, and we can by no means review it fully until we have information at present denied to us. But we cannot pass it over, this week, wholly without comment. At first sight the publication of the letter seems only to be accounted for in one of two ways:—either that Iwasaki has private reasons for wishing to break up the Company, or that he hopes to force the Government to grant an increase of subsidy. It is difficult for us to regard such a document from the Japanese stand-point; looking at it from the point of view of the foreign man of business, we are forced to the conclusion we have stated, and, while we will not deny the possibility that the second object may be achieved, cannot but think the destruction of the concern by far the more likely result. And, agreeing with the writer to the full in all he says of the national importance of the Company, and of the serious loss to the country in prestige which will result from its ceasing its operations; we cannot but think that the country's profit, and particularly the profit of all the shareholders but himself and his personal friends, will be best secured by the cessation of operations at the earliest possible moment. To start, and carry on successfully, a great enterprise like this requires experience, special knowledge and traditions of practice which no young mercantile community, such as that of New Japan, can be expected to possess; and without foreign help, and foreign help of far superior character than the Mitsu Bishi Company at present possesses, the work of a large Steam Navigation Company is altogether beyond the country's strength. It should not have been undertaken without far more consideration and forethought than were ever given to the enterprise; and, as nations and governments, as well as individuals, are liable to mistakes which occasionally place them in false positions,—so the best thing for the nation or the government, as for the individual, is to recognize the error and retreat from the wrong ground, as soon as may be.

Iwasaki's statement is open to the crushing reply that it is incredible: no sensible man can by any possibility believe it. He has been running a line of five steamers, valued at a million *yen*, between this and Shanghai, touching at the Japanese Coast ports. There has been virtually no opposition, and he has had almost the entire goods and passenger traffic at fair rates. The Company from whom he bought the vessels ran them at a cost of, on a high average, \$7,000 a month each for four, one being always laid up in reserve:—say for all of them for the year, of \$340,000. He has had, in addition to certainly as much as this in freight and passenger money, a subsidy of \$250,000 from Go-

vernment, and yet Iwasaki impudently tells the public that on this line he is *losing* \$300,000 a year. He must publish accounts of the line, and these accounts will have to be 'cooked' in some fashion as yet undiscovered by accountants, before he will succeed in deceiving any shareholder, the most confiding, into belief in such a statement. Again, he tells us that he derives no profit from his other lines, and particularizes losses on some. Now we all know that there is so large a native trade between this and Osaka, the carriage department of which is wholly in his hands, that he has continually to put on extra steamers, and that foreign cargo is frequently shut out, the vessels being as full as they can be loaded. Again we challenge him to produce detailed and properly audited accounts, of these subordinate lines. Until this is done, neither can we accept the figures he vouchsafes us of fourteen thousand *yen* lost on the Hakodate, and three thousand odd on the Hoki line.

The rest of his 'facts' where he affects to given any, are equally unsatisfactory. The chartering of his steamers by Government for the carriage of troops during the civil war last year certainly inconvenienced shippers considerably, and the war itself doubtless also checked trade. But we are to presume that the Government paid for their charters, that the troops were not carried for nothing; and ship-owners who get charters for their vessels as troop-ships do not generally have to complain of any losses on such business. Besides, he tells us that it was from December to February last, that his Shanghai line lost \$72,000 (which, as he says 'means a loss of \$300,000 a year') and Government charters did not interfere with him then.

We are quite aware that Iwasaki and his friends have completely mismanaged the line. Their steamers were bought, as a rule, badly, to begin with. A million *yen* was not a very extravagant price to pay for the Pacific Mail Company's property—steamers, wharves, land, and plant,—considering that, besides the property, the P.M.S. Co. was bought off the line, and their vessels got in running order, with officers and crews complete. But subsequently, they put themselves into extremely bad hands, and made most injudicious purchases. Always, they have failed to take proper care of their vessels, have stinted them of docking and repairs, and, having given far too much for their ships, have refused to spend the necessary money to keep them in good order. Their treatment of their foreign officers has been scandalous; they have paid them badly, unshipped and transhipped them unjustly and capriciously, insulted them by want of confidence, and, by a general line of conduct showing that their main object was to get rid of them as soon as possible, have discouraged and depressed them in every way. This is not the way the Cunard, the P. & O., the White Star, the Royal Mail, and the other great Navigation Companies of the world breed for themselves a succession of skilful, painstaking, zealous and trustworthy officers; and in no way does the Company

deserve the retribution of failure more than by its treatment of its foreign employees.

In the absence of authenticated statements of accounts by the Company or its Director, and not having as yet had time to make out any rough figures of what *ought to have been* their expenditure and receipts for ourselves, we must leave Iwasaki and his Company for future dissection. We may conclude by telling the Government that, if this individual and his co-managers cannot carry on a thoroughly efficient service, for mails, passengers and cargo, between all the ports in China and Japan where the Mitsu Bishi flag is now seen, with the help of a subsidy of 250,000 *yen* per annum;—there is more than one foreign firm in Yokohama that can do it for less, and give heavy guarantees that in all respects the service shall be more efficiently performed.

THE FORESTRY LAWS. II.

IN our issue of April 6th, we commenced our review of the Forestry Notification recently issued by the Naimusho; and, having pointed out the important omission of any regulations for Governmental or Communal forests, we remarked on the excess of interference proposed in the management of 'private' forests, interference with no counterbalancing advantage of encouragement, by subsidy or loan; and promised to go into details on this point. This promise we fulfil to-day.

In countries where the science of forestry is properly understood and practised, private woods may with great advantage be left in the hands of their proprietors, without any interference on the part of government. Some owners will cultivate them merely for the beauty with which they ornament their domains, others for the protection they afford to game; some to give shelter to the land, others to supply fuel or timber for sale. In all cases, private interest may be trusted to turn them to good advantage, and when sudden pressure for money forces an improvident or unfortunate land-owner to cut down his woods, the damage done to the district around him is infinitesimal, and no one is injured to any great extent but his heirs. In Japan, we see that landed proprietors are so ignorant or so greedy, that this damage becomes serious, and here we think that Governmental control might be exercised to advantage. For instance, grants of land in Hokkaido having recently been made, in lieu of their pensions, to some dispossessed *moazoku* and *shisoku*, these men have immediately commenced to denude the land entirely of its trees, have sold the timber, down even to the brushwood, and then—without making the least provision for the re-growth of wood, or, indeed, any attempt at cultivation in any form—have simply abandoned their grants, and gone to live, in the towns, on the proceeds of the spoiled land. We do not find in these newly-notified regulations any attempt to interfere with this class of private proprietors, where control would be most fit and reasonable, but what the Government aims at is to increase a new one—of wood-farmers—who shall specially devote their capital, time and labour, to improving the country by afforesting it, where it has been denuded of wood; and what we wish to point out to the authorities is, that the conditions they offer are not sufficiently advantageous to induce such investment. A rent of from two-tenths to one-half of the produce is a crushing one, when are considered the first cost of preparing and planting waste lands, and the length of time which must elapse before any return is received, in the case of land afforested with a view to the future provision of timber or fuel; while the vague character of Sec. V. must act as a deterrent to a proprietor planting waste hillsides for ornament, or for improvement of his adjacent property. Such plantations can hardly be expected, if the government

retains the right, after the trees are grown, *i.e.* when they are doing what they were planted for—ornamenting or protecting a domain,—of stepping in and either cutting down half of the forest, to the detriment of the remainder, or of inflicting a heavy fine upon any proprietor who wished to keep his woods. We are not acquainted with any European country where such regulations would not check, instead of promote, the afforesting of waste lands. Of course, if the land should be unavoidably required for public purposes, the Government would have an indubitable right to re-enter in possession, as provided for in the note to Section V. but should pay, in such cases, at a fair valuation for the grown and growing timber. But otherwise, the title given with waste lands granted for afforestation should not be in any way insecure, should be in perpetuity, and its rent should be a moderate tax on the sales of wood; below even two-tenths. A tenth would be quite sufficient, and this percentage should be paid by the wood grower when he made his periodical sales. It would be to his advantage to sell to best advantage, thus increasing the amount of the Government's share; it would be difficult for him to conceal the prices he got for his produce; and he would spare the Government all the expense of agency, appraisement, cutting and removal. Government, in return for the tenth of the proceeds of sales, should provide proper means of transit for the cut timber, which would again redound to its advantage, as the more easily carried the wood, the greater the price it would fetch. And there is yet another item of assistance which the Government ought to give as an inducement to afforestation. It should give seed *gratis*, and might also, with great advantage, in the case of new, imported, species, give young plants reared, during their first difficult and most expensive years of infancy, in governmental nurseries. Also—and this is really of the highest importance—such instructions as we sketched out in our article of February 16th should be published and widely distributed in the *kens* where afforestation is desirable; while cadets of the new Department of Woods and Forests should be sent to study in the Forest schools of Germany, France and England, to fit them for their duties as inspectors, for which they certainly will not be ready, even with the best of educations, till the first of the new trees are grown.

It may appear to the framers of the Naimusho Notification that our recommendations, if carried out, would leave the Government very small profits out of the expected transactions, in lieu of the two-tenths or five-tenths of the product they propose to take. But, in the first place, we entertain the gravest doubts whether any capitalists will be found to invest money in such a business, and go on spending for fifteen years without return. And secondly—and mainly—it should be considered that what the Government will be doing in promoting the afforestation of the waste places of the country will be a general, a public good, and it is to be congratulated if the money it has to expend is approximately balanced by receipts in taxes. There should be no thought of making direct money profit out of the business. For as, if disafforestation be allowed to go on, the climate will deteriorate, the whole country suffer, and, finally, famine come to do in Japan what it is doing in China: so, by the promotion of afforestation, the whole country will gain, and for such an end the expenditure of public money is legitimate and desirable. For the growth of trees, it must not be forgotten, besides the advantages we have so often enumerated, contributes, indirectly, but largely, to the fertilization of all lands that are situated at a lower level than the plantations. The waters which drain down from forest lands, and which the rivulets carry into rivers, are highly valuable, impregnated with the decayed vegetable matter annually shed by the trees, and furnish their quota of compost to the cultivator in the form best suited for assimilation by his growing crops. It

is thus, as a benefactor to the country generally, that the forest-grower should be regarded and, as such, every inducement should be given to him and all assistance he can require. He must not be checked in his useful career, by vexatious governmental interference with either his processes or his profits.

Section VI., which provides for the local authorities keeping forest records, is excellent, and might with advantage be extended to cover a number of particulars not mentioned at present. Section VIII. is also good in intention, but the age for thinnings in the case of conifers ought to be extended to at least twenty years, during which the tenant should have the use and benefit of them, they being worth comparatively little, and it being an object to encourage the diligent thinning of such woods. Whereas, we think, after eight years, the cultivator might fairly be asked to pay his tax on the sales of all thinnings of his hardwoods, which are of much greater value. The arbitrary four posts, at four corners, ordered by Section IX. will seldom be found to give a convenient boundary line, and the natural configuration of the land should dictate the limits of the forests, and these should be fixed by the Government authorities, not by the tenant. The only other criticisms which we have to make are with respect to the note to Section X. relating to mortgaging or pawning the trees; and on the note to Section XI. which fixes three years as the limit allowed for plantation. We do not think that mortgaging growing timber should be allowed at all, inasmuch as the mortgagee has no interest in its preservation and increase; and, with respect to our last objection should be remembered the almost numberless varieties of circumstance in connection with afforestation, before laying down such a hard and fast line. A penalty for want of due diligence on the part of the tenant, proved by the local authorities, and with an appeal to the Head Office, appears to us all that would be necessary. In conclusion, as we are sure the Government appreciate our interest in this question as unselfish, so we hope that they will accept our criticism as well-meant. If they will attend to the general lines of our suggestions, that encouragement and assistance must be given to the planter, not a large part of his gains demanded from him; and that interference should be judicious and as slight as may be consistent with due care of the public weal;—all details may safely be left for subsequent arrangement by the municipal and provincial authorities, and proper adaptation to local requirement; and any information that we can give or procure for them, from sources unknown or inaccessible to themselves, will always be freely placed at their disposal.

THE following Notification, calling in all the old paper money, of one *yen* and under, (the *Daijokwan no Satzu*), first issued in 1869, was published in Tokio yesterday:—

NOTIFICATION No. 19TH OF THE OKURASHO,
(the Financial Affairs Department.)

To *Fu* and *Ken*,

It is hereby notified that the circulation of the paper money of and under one *yen*, which were issued by the *Daijokwan* and *Mimbusho*, will be discontinued after the 30th day of the 6th month this year; that the exchange of the same shall commence on the 1st day of the same month; and should be effected without fail before the period expires. The application for exchange should be in accordance with the Notification No. 20th of the 2nd month of the 8th year of Meiji.—

Note. The words *Shiheiryo* and *Shiheinokami* written in the application for exchange should be looked on as *Shiutsunokiyoku* and *Shiutsunokiyokuchō*, and the money for exchange should be paid out from the *Shiutsunokiyoku* in the neighbourhood, or out of the amount of deposits.

OKUMA SHIGENOBU,
Minister of Financial Affairs.

18th day of the 4th month of the 11th year of Meiji.

REFERRING to an article from the *Hochi Shimbun* translated into our columns from the Japanese press in which the writer urges the 'powerful old crane' to utter a cry of warning—i.e. that Government should interfere to limit the production of silk-worms' eggs, the following translation of a report from a Japanese in Italy on the prospects of last year's exportations of eggs on native account is of great interest. It was published in the *Chiugai Bukka Shimpō* of the 6th inst.:—

"The present state of the trade in silk-worms' eggs is 'very dull, which is due, I think, to the excess of stock over demand, and to its being yet too early in the season for transactions. Current prices quoted by merchants and brokers are said to be from 2 to 3 *lire* per card, but the price at which silk-merchants actually sell to customers, or make contracts for, is a little higher. Under these circumstances, not even two or three-tenths of the total import are being disposed of, but merchants do not seem to be distressed at the prospect, for they say: 'If the price is so low in the beginning of the season, there is no fear that it will go lower,' and 'when the silk-growers hear of these low prices, they will put aside their home grown eggs, and buy imported ones, so that though the import be large, it will not be wasted.' I cannot predict what the future of the market will be, but at the same time, I cannot put much faith in these arguments.

"The eggs which Silk growers generally like best are those grown at *Kawashiri-gōri* in *Akita*, and their price is about fifteen *lire* per card; the *Shimamura* and *Yanagawa* ones come next, and these of *Joshin*, *Bushiu* and *Shinshiu* are disliked, whether the quality be good or bad; the latter two sorts may not always be bad, but there being not a few carelessly filled, I regret to say they have got a bad name.

"Silk-merchants and silk-growers in this country are, contrary to my expectation, inexperienced in judging of the quality of the silkworm eggs, and as it is their custom to buy simply by marks and by rumour of their character, I consider those with *Akita* marks will grow more and more into favour, and that *graineurs* coming to *Yokohama* this year will doubtless compete for buying this sort."

To silk-men in this country, this letter is excessively amusing, but the humour of it is so purely technical that its development would be thrown away on the majority of our readers. We may, however, for the benefit of our native friends, say a few words on the subject next week, when we shall be less pressed for space than on this occasion.

PAPERS OF THE GERMAN ASIATIC SOCIETY.

(Appendix to Dr. Naumann's paper, published March 30th.)

CATALOGUE OF THE EARTHQUAKE LITERATURE OF JAPAN.

A. EARTHQUAKE CHRONOLOGIES.

- 1.—*Jishin Nendaiki*. Earthquake Chronology.
- 2.—*Honchō Jishinki*. Description of Japanese Earthquakes.
- 3.—*Ojishin Kō*. Considerations on Japanese Earthquakes and their actual consequences.
- 4.—*Kiōtō Ojishin Nendaiki*. Chronology of the great earthquakes of *Kiōtō*.
- 5.—*Shokoku Jishinki*. Account of the earthquakes which have occurred in the various provinces.

B. EARTHQUAKE MONOGRAPHS.

- 6.—*Shinano no kuni Ojishin San-sen Hōgeki dzu*. Great earthquake in the province of *Shinano*, with account of the destruction wrought by rivers and mountains (1847.)
- 7.—*Shinshiu Saikawa Hōgeki Rikugun Hiyōtō no dzu*. Destruction occasioned by the river *Saikawa* in *Shinshiu* (1847.)
- 8.—*Shin-Etsu Ojishin*. Great Earthquake in *Shinshiu* and *Echizen* (1847.)

- 9.—Shokoku Ojishinki. Description of a Great Earthquake which extended over many provinces.
- 10.—Ansei Kembun Shi. Account of events which occurred in the period Ansei (1854-1859). This book recounts the destruction in Yedo, occasioned by the Great Earthquake of 1855. It also contains an account of the fate of some who suffered in it.
- 11.—Ansei Kembun Roku. Record of events during the period Ansei. This work contains chiefly an account of the remarkable fate of some people during the Great Earthquake.
- 12.—Shinshiu Jishin ki. Description of the Great Earthquake of Shinshiu (1847). Recounts the destruction which took place in the six districts of Shinshiu by the Earthquake, and by the inundations.
- 13.—Ojishin Tairiaku. Abridged account of a Great Earthquake. This contains exclusively an account of the destruction wrought by the Great Earthquake of July 7th 1854 to the streets and buildings of Kiôtô. It also contains many of the memorials made to the Shôgun by the Daimiôs relative to the devastation of their provinces.
- 14.—Zatsu-shiu-batsu-sho. Extracts from a miscellany. It contains. 1° The devastation wrought in Shinshiu by the great earthquake. 2° The numbers of killed and wounded people and animals in the various parts the district. 3° Reports from the Daimiôs to the Shôgun.
- 15.—Jishingo Sezokugo no Tane. Contents. 1° Concerning the god Zenkoji: and a very detailed account of the Shinshiu earthquakes. 2° Illustrated account of the destruction wrought in the district by the earthquake, by fire, and by the inundations. 3° The fate of the inhabitants of the province. 4° The inundations of the Saikawa, and of the Chikuma-gawa.
- 16.—Ojishin Onkaki-age. The report to the Shôgun of the Daimiôs of Shinshiu relative to the great earthquake of 1847.
- 17.—Shinshiu Jishinki. Detailed account of the Shinshiu earthquake.
- 18.—Bukô Shinsai-riakki. Description of the evils occasioned by the earthquake of Yedo.
- VOLUME I.—1° Destruction of parts of Yedo by earthquake and fire. 2° Fate of some of the people
- „ II.—Fate of some of the people.
- „ III.—Map of Yedo, in which the burned quarter is marked.
- „ IV.—The same contents as I and II.
- C. CONCERNING EARTHQUAKES IN GENERAL.
- 19.—Jishin Kô. Considerations on earthquakes.
- 20.—Jishin setsu. Earthquake Theories.—1° European theories on the origin of Earthquakes. 2° Examples of great earthquakes in America, Europe and in Asiatic Countries.
- D. BOOKS RELATING TO VOLCANIC ERUPTIONS.
- 21.—Shin-shiu Asama-yama Yakekikigaki. Description of an eruption of Asamayama. It contains:—1° Eruption in the third year of Temmei (1783). 2° Reports of the Daimiôs and provincial officers on the devastations wrought in their respective provinces by the lava, showers of ashes, and earthquakes.
- 22.—Tem-mei Shin-shiu Jô-shiu Hen-riaku. Abridged account of the eruption in the Temmei period in Shinshiu and Jôshiu.
- 23.—Idzu no kuni O-shima Ka-san no ki. Description of the Volcanic island of Oshima situated in the province of Idzu. It contains an account of the outbreak of Mihanayama in 1684; the rest is chiefly reports from the provincial officials on accidents and eruptions.
- 24.—Idzu Kai To-shi.
- 25.—Awogashima (an island south of Hachijô). Contents. Earthquake Eruption and formation of a cave.—
- 26.—Ya-shiu Shiranayama Shin do Jô-shin. Account of movements of Shiranayama in Kôzuke. It also contains an account of an earthquake, and of the eruption which occurred in the sixth year of Meiji.
- 27.—Fuji Kô-sha-ki. Account of a shower of ashes from Fuji.—
- 28.—Onsengatake Shoshitsuki. Account of an eruption of Unsengatake.
- 29.—Suru-ga no koku shi Fuji no koto. Description of Fujiyama in the province of Suruga.
- 30.—Sei-yu Zatsu-ki. Miscellaneous sketches of a tour in the West of Kiushiu. Also a short account of the volcano Asoyama in Higo.
- E. AUXILIARY WORKS.
- 31.—Shin-sen Nempio. In this work the years back to 3984 B.C. are placed together in Japanese, Chinese and European chronological order. The days cannot be exactly verified by the aid of these tables; this can only be done in the case of the years. For instance the first year of Meiji according to this Calendar is 1868, whereas in reality it is 1869.
- 32.—Tai-yo Tai-in Rio-reki Tai-shiyô-hiyô. Comparative tables of Japanese and European dates. The author says in the preface; "In this book I have compared the old calendar with the new; so that we may be able to reckon our ages according to European years, and also that we may fix the dates of the deaths of our fathers and ancestors according to the same system.
- The tables unfortunately only go back as far as 1501.
- (The following are the Japanese titles of the above mentioned books, numbered as in the English list.)
1. 地震年代記
 2. 本朝地震記
 3. 大地震暦年考
 4. 京都大地震年代記
 5. 諸國地震記
 6. 信濃國大地震山川崩激圖
 7. 信州犀川崩激六郡漂蕩之圖
 8. 信越大地震
 9. 諸國大地震記
 10. 安政見聞誌
 11. 安政見聞録
 12. 信州地震記
 13. 大地震大略
 14. 雜集拔書
 15. 地震後世俗語之種
 16. 大地震御書上
 17. 信州地震記
 18. 武江震災略記
 19. 地震考
 20. 地震説
 21. 信州淺間山燒聞書
 22. 天明信州上州變略
 23. 伊豆國大島火山之記
 24. 伊豆甲斐土誌
 25. 青ヶ島
 26. 野州白根山震動上申
 27. 富士降砂記
 28. 温泉嶽燒失記
 29. 駿河國誌富士之事
 30. 西遊雜記
 31. 新撰年表
 32. 太陽大陰兩曆對照表
 - 33.—Japanese Chronological Tables, compiled by E. M. S.
- The changing of Japanese dates into European, is much more difficult than perhaps the reader may imagine. Not long since the Japanese only had lunar years such as, for instance, the Greeks had. The year was calculated by lunar months, and by means of intercalary months, the lunar year was made to coincide with the solar year. The

sixty year cycle was also used. For the calculation of the years the above named auxiliary books were used. As far as the records before 1501 are concerned, the dates calculated in this manner cannot be regarded as completely correct. In a number of cases, and especially when the earthquakes occur in the first or last months of the year, the convulsions really occurred a year earlier or later than that given. Moreover the authorities themselves cannot be regarded throughout as exact in the years. Thus for example the Jishin nendaiki, and the Honcho jishinki differ frequently from each other. The former appears to me to be entitled to somewhat more credit.

THE ERUPTION OF FUJIYAMA IN 1707.

“AN occurrence such as that of the year 1707, when “Fujiyama suddenly opened in a place which was “overgrown with trees, and vomited out fire, and when “ashes and stones were thrown out and fell over provinces “and districts, is certainly a rare one. This rain of stones “and ashes lasted for ten days, so that fields, temples and “houses were covered with the ejected masses to the depth “of ten feet. The inhabitants in the neighbourhood of “Fuji lost their homes, and many died of hunger. Of “numerous villages, not a trace is now to be found. I “myself have been one of the unhappy eyewitnesses of this “awful eruption, and the memory of it fills me with sorrow “and anguish.” As I spoke thus to my friend, the tears wetted my cheeks, and I could not withstand his pressing request that I should write down what details I knew of the abovementioned remarkable occurrence, and so I have written them as follows:—

The temple of Unkiyosan Jôkojenji, my former residence, lay on the eastern side of Fuji, and from four to five *ri* distant from it. On the morning of the 16th December, 1707, I was much startled by a violent earthquake which was accompanied by subterranean noises. Houses and other buildings were rocked to and fro by the violent shocks, like a ship on the sea by the waves, and were thrown down. At eight o'clock, the hollow noises which came from the South West resembled thunder a hundred thousand fold increased. Soon after, black masses of smoke rose up from the mountain, and spread over the whole heavens, turning the day into dark night. Stones each as large as a football, now whizzed through the air, and, falling to the ground exploded in sparks. I observed one of these fallen stones; it resembled a snail's shell, was of a yellow colour, with a very unpleasant smell, and very trifling weight. Here and there the balls of lava set houses on fire, and killed people. Most awful was this fatal time! Men and women, people of all ranks and of every age, lay before the images of the Gods, imploring with loud cries for protection and rescue, and some desiring a speedy death. Towards evening, the noises resounded both from the East and West; the shocks came now with such fearful force that it gave one the feeling of having the head split. The noises came afterwards from another direction, and ice and stones (*Hiyôseki*) about the size of peaches fell to the earth; they had a salty taste, and were as heavy as gold and lead. At length, on the morning of the 17th December, the shower of ashes abated somewhat, and the subterranean noises also grew weaker. Now also, the sky was again visible, where the black clouds separated; and when I got the first glimpse of the glimmering stars, I knew that the world did not as yet lie in ruins. Every thing was now covered with ashes. The spirit of life was broken for us. We reflected within ourselves, why should we live. Even though heaven and earth and men are still here, it is better to die. The sun had lost its lustre, and the day was again became night. The helpless people suffered from hunger and thirst. Wells were not to be thought of. The unhappy wretches had to run to the large river in order to slake their thirst with the dirty water. On the 18th December, the fall of ashes became much less, and now for the first time parents could descry their children without lanterns or torches. A man who made a visit into a neighbouring district found as follows:—When Fuji commenced to vomit fire, and nameless misfortunes were being prepared for us, all was quite still in the neighbourhood. The inhabitants were nevertheless in the greatest fear, and leaving their property behind them, fled from their houses. It fared badly with the animals, most of whom were struck by the falling stones.

On the 19th December, the sun looked out through the clouds, but still the shower of ashes did not cease; also stones the size of a peach fell. From this day forward Fuji was visible.

On the 31st December, it was at last quite still; the shower of ashes had ceased, and the weather was beautiful as usual. The government had the corpses buried, and the depth of the bed of ashes at the different places measured. The strata varied greatly, according to the distance from Fuji, and to the elevation or depression of the place. At some of the villages in the neighbourhood and at the foot of the mountain, the ashes were twelve feet in depth. In my neighbourhood (my temple lay only three *ri* from the village of Fusomura, and nine *ri* from the summit of Fuji) they were over three and a half in the valleys, and on the other hand on the hills 10, 20, 50 and even 70 feet in depth.

The above is far from being a complete account of the distress occasioned by the eruption of Fuji in 1707, in all its terrible details.

The book Okubo Kaki relates as follows:—On the 16th December 1707, masses of smoke ascended from the crater of Fujiyama, and the mountain threw out glowing ashes and lava over an area of 20 square *ri*. The shower of ashes lasted until the following month. The river Sanosekigawa, and the lake, sixty *chô* in area, near Gotemba, Futabashi, Fukasawa, and Nishita were filled with ashes, so that no water was to be found there. At the village of Nisugimura the ashes were 7 feet deep, and therefore reached nearly, to the roofs of the peasant's houses. In certain villages the ashes pressed into the houses themselves, and three were crushed by the weight. At the village of Midzutono they lay also 7 feet deep, so that only the roofs were visible; at the village of Tsubashimura 10 feet, Kosatsuba (Place of the Notice Board) covered with ashes; half of Asama temple hidden in ashes; only one part of the roof of the building Jushinomon visible; the building almost entirely buried, the roof only visible, which was also the case with the Gohonsha. In those places where the shower of ashes was particularly heavy, such as Midaikamigo, the bamboos were left leafless, and as a general rule, only the trunk and boughs were left of the trees and plants. In the villages, in which the ruin was especially great, the people suffered from want of water, and it had to be procured from great distances. As the wheat and rice fields in the Odawara district were completely destroyed by the shower of ashes, the Government gave the prince new territory in March 1708, to the extent of 56,300 Koku.

An individual named Chiuosô relates as follows:—

From about the 20th of the 11th month of the 4th year of Hôei (13th December 1707), the weather in Yedo was very rough and cold. At 12 o'clock on the 23rd an earthquake stock shock was felt, and subterranean noises were heard from time to time. At first the sky appeared only partially dark, and that from South to West, as if it were spread over with ink. But the black cloud grew visibly larger, and when the setting sun showed itself once more through the clouds, all Yedo presented a very woful appearance. The heavens were soon quite concealed by dark masses of smoke, and it had become dark night: At three o'clock it began to rain gray ashes; and the inhabitants were stricken with a great terror. Old people asserted that the ashes came from Asama in Shinshiu, as had been the case eight or nine years previously; and this somewhat cased the minds of the populace. The fall of ashes now became heavier and heavier; the earth shook night and day, and black darkness reigned over all. By day lanterns had to be used in order to distinguish colours. The streets were desolate, and of the few who ventured out, some injured their eyes, or suffered in other ways. People thought the utter destruction of the earth was at hand. The cries of women and children in their fear were unceasing. When the news of the eruption of Fuji reached Yedo the following day, the people felt relieved. The layer of ashes was 7 or 8 in. deep, and in many places was more than a foot. After the fall had ceased, the ground was cleared; nevertheless, for seven or eight years after, every wind swept ashes before it.

A letter from Fujigori in the province of Suruga, gives the following account:—

“From 2 o'clock yesterday, the 22nd, until to day, about thirty intense earthquake shocks occurred, which destroyed many houses. Yesterday at 10 o'clock, hollow subter-

anean thunder began to roll, and shortly after black clouds of smoke became visible over Fuji. All the inhabitants were filled with the same painful anxiety, but no one up to the present has been killed. The masses of smoke rose higher and higher over the mountain. During the day nothing was seen but these black clouds, but as night came on, flashes of fire sprang from the mountain."

After this letter was received in Yedo, the fire became greater and greater, and ashes and stones were thrown up in all directions and fell, some of them twenty *ri* off, in the neighbouring provinces. The shower of ashes was especially heavy in Idzu, Sagami and Suruga; in some places it was 20 feet deep, so that the number of houses and temples which were destroyed, and of fields which were wasted, could not be estimated. The violence of the eruption began to abate, and at last it ceased completely. A great crater was formed where the lava was thrown out, and near this a new mountain called Hoyoisan arose. At that time this widely renowned mountain, the equal of which will be sought for in vain in China and Corea, injured its beautiful form. How mournful!

EDITORIAL NOTES.

WE publish above as much more of Dr. Naumann's interesting paper on earthquakes as we can find space for in this number. We omit a list of the earthquakes since the 5th century, which was given in part in Mr. Hattori's paper read before the Asiatic Society and published by our contemporary the *Japan Mail*. This list mentioned 149 earthquakes and occupied nine columns of the paper, Dr. Naumann enumerates 196, and gives fuller particulars. We give a list of the books consulted by Dr. Naumann, which students of the subject may like to have—but we think it only necessary to give two or three specimens of particular disasters. If the reading of the instalment to-day has the same effect on our readers as the preparation of it for the press has had on the writer, a decided feeling of insecurity and disinclination to invest in house property in this country will be experienced.

We think it right to mention that Dr. Naumann's paper was read on the 16th Feb., Mr. Hattori's on the 23rd March.

WE appear to have been misled in our surmise that the *Eurydice* was lost in the West Indies, if the following telegram is correct which was received and published by the Shanghai papers:—

"London, March 24th, (midnight).—The British Naval Training ship *Eurydice*, Captain Marcus A. S. Ware, belonging to the Portsmouth Station, has capsized in the English Channel, with a loss of four hundred lives."

There can hardly be any way of accounting for the disaster in such a latitude except that which we have suggested, that no compensations were made for her changed weights, when her battery was altered. A terrible disaster, happen how it may have done, and only paralleled by the loss of the *Royal George* in 1782, when

"——Kempenfeldt went down
With twice four hundred men."

The particulars of this misfortune are now almost forgotten, but many of us may recollect seeing pieces of furniture and articles of 'Tunbridge ware' made from pieces of the wreck, when she was blown up in 1839, after many ineffectual attempts had been made to bring her bodily to the surface. She capsized because heeled over too much, while some repairs were being done to her bottom, and from neglect to close the lower deck ports on the depressed side. She was one of the finest vessels then in the fleet, carrying 108 guns. Vice-Admiral Kempenfeldt was aboard her at the time, writing in his cabin. As Cowper wrote

"His sword was in its sheath
His fingers held the pen,"

and with him sank eleven hundred men, women and children, of whom only about two hundred were saved. One can hardly imagine such an accident happening twice in a century in the English navy, and we await particulars of the loss of the *Eurydice* with no little curiosity.

WE HAVE been hesitating, for some days, whether we should, or should not, take notice of the '*Chihokuwan Kuwaigi*' or Assembly of Provincial Governors. Our Tokio correspondent, who furnishes us with the translations from native papers which we publish weekly, writes us, yesterday, to say that for some days the principal journals will be full of reports of the proceedings of this Assembly, and asks whether we want the debates. Probably a slight synopsis of the subjects treated will be all that our readers will care for; the House is a mere caricature of the Representative Assembly promised by the Mikado to his people when he resumed power, and has about as much influence on the conduct of affairs in Japan as the Oxford Union exercises on the deliberations of Lord Beaconsfield's Cabinet. But we will, next week, give a sample of the reports; and shall then be able to judge whether the whole series is worthy of record.

THOUGH writers in the native press have to use much circumlocution and parable in criticising the acts of their own government, they are certainly candid enough when they have to treat of those of foreign countries, and call things by their right names with charming frankness. But they are not often so well justified in their strictures as is the gentleman whose article on the imbecility of what is called International Law we quote to-day from the *Nichi Nichi Shimbun*. France, Germany, England, Russia, and Austria all in turn get their share of rebuke, and it cannot be denied that his cynical conclusion is natural,—that, in the event of war between England and Russia, Japan should, instead of "perplexing herself about the principles of International Law," keep a bright look out for herself and pick up any advantage she may be able to gain. It will be just as well, though, we may hint, that in this laudable care for their people's interests, Japanese statesmen should be cautious to do nothing at which either of the combatants can take offence, lest Japan should furnish another to the list of victims of Great Powers' disregard of International Law, when dealing with little ones.

To both native and foreign readers, who are interested in the subject of International Law, and anxious to know what legislative power formulates its edicts, what tribunal is to issue its judgments, what force to put them in execution, we recommend the study of the introductory chapters of Mr. Kinglake's brilliant and exhaustive History of the Crimean War, in which he treats of the 'Public opinion of Europe' and 'the Balance of Power.'

A CORRESPONDENT of the *Nichi Nichi Shimbun* revives the discussion on 'Straw shoes versus Boots' for the army. He prefers the former, and argues, very properly, that because boots suit European soldiers, it does not follow that they should be suitable for Japanese. He points out that Europeans, being used to wearing boots from their childhood, do not feel the same inconvenience from wearing them as do the native soldiery; and as for the argument that the leathern boot better protects the foot against spikes &c., in rough ground, he disposes of this by showing that as the Japanese army is recruited mainly from the agricultural classes; these peasants, farmers, hunters and woodcutters having all their lives been accustomed to wear straw shoes on rough ground, he fails to see why they should find them any worse wear, after they have become soldiers than they did before. On the other hand, when they are first shod with leathern boots, instead of being able to move easily and quickly in them, they are—as he puts it—'like an old man walking on a bridge made of a single log, even when they are walking on level ground.' Also that when they have worn them for some time, a march of two or three miles knocks up a good many of the men with sore feet from the friction of the boots, and how much worse would this be in rough ground on actual service?

He is not so successful in disposing of the principal argument on the other side of the question:—the enormous quantity of straw shoes requisite on service, and the difficulty of transport; his only reply being that the shoes should be made stronger. This is an insuperable objection to the use of straw sandals, and as the matter is one of great importance, we strongly again commend to the notice of the War office the suggestion made by ourselves when discussing the question in our own columns—that a sandal with a leathern sole should be tried. As we pointed out,

our own soldiers in the Indian mutiny, when forced marches had to be made, cut down their boots into sandals with great advantage and comfort to themselves and we are quite certain, from both reading and experience, that some sort of leathern sandal is the best and cheapest foot gear for the soldier, easily, by means of a gaiter, made to look sightly on parade.

NOTICE TO CORRESPONDENTS.

No notice will be taken of anonymous correspondence. Whatever is intended for insertion in the JAPAN TIMES must be authenticated by the name and address of the writer, not for publication, but as a guarantee of good faith.

Manuscripts found unsuitable for our columns will be carefully returned to the writers.

YOKOHAMA: SATURDAY, APRIL 20, 1878.

NOTES OF THE WEEK.

FRIDAY EVENING, April 19th.

WE notice that during the tea season a monthly line of steamers will leave for New York via the Suez Canal, the agents here being Messrs. Jardine Matheson & Co. This move should have the effect of bringing down freights on the two rival Pacific lines. Up to the time of our going to press we have received no inward home mail since our last issue, but the *Gaelic*, which is bringing the English mail, due here on the 16th, is now hourly expected. The *Tibre*, with the French mail due in London June 10th, left on Wednesday morning, and an outward and inward mail to and from Hakodate, and to and from Shanghai and ports, have to be recorded.

The time of the *Glencagles* from Shanghai hither will hardly be beaten. She lost four hours by having to stop outside, in consequence of thick weather, but made the passage, including this delay, in little over eighty hours. Thus her speed must have averaged about fourteen knots: and this in moderately heavy weather. Very interesting, in connection with this trip of the *Glencagles*, are the reports which reach us from Bombay of a public meeting held there in the Town Hall on Friday the 1st March, to memorialise the Postmaster General of England with respect to the renewal of the Overland Mail contract, when the P. & O. contract expires in February 1880. Many speeches were made, all advocating competition for the contract and insisting upon the necessity of an increase of speed. Nearly thirty years ago, it was argued, the P. & O. ran very inferior boats to what they possess now, at nine nautical miles an hour, and their present speed is only nine and a half. Whereas the Cunard, White Star, Inman, and other Atlantic mail steamers do their 12 and 13 knots an hour, and there is no reason, say the Bombay merchants, why the Indian mail steamers should not do as much, so as to deliver the London mails in Bombay in 16 days, which would necessitate an average speed of about 12½ knots between Bombay and Suez, and 13 knots an hour between Alexandria and Brindisi. The memorial, adopted further urged the abandonment of the Southampton line as useless, and the separation of the Australian and the China mails from the Indian mails in the new contract. The object of holding the meeting was to back up the representations already made by the Calcutta, Madras, and Bombay Chambers of Commerce respecting the terms of the new contract, and to impress upon the Postmaster General that India ought to be consulted in the matter. It would be most desirable for the Chambers of Commerce of China and Japan to object to this separation of interests. We do not see that our interests are less to us than are Indian merchants' to them; and that the P. & O. steamers should come on at 12 or 13 knots as far as Galle and then slow down on the China line to 9 or 10, is most 'tolerable and not to be endured.' No—in this case, if the geese of Bombay are to get such a *sauce piquante* as thirteen knots, we ganders of the Far East are clearly entitled to the same service.

The existing mail contract with the P. & O. Company was entered into in 1860, and will expire in 1880. By it the Company undertook to carry the mails at an average speed of nine knots an hour, which was thought very fine twenty years ago. In 1874 the Company asked to be allowed to carry the heavy portion of the mails through the Suez Canal, instead of overland through Egypt according to the contract, and a modification of the contract was then achieved by the Postmaster-General, by which the speed was increased to nine and a half knots, and the subsidy was reduced by small sum. It is clear that the speed must be increased con-

siderably in the new contract, for it is not in accordance with reason that the steamers of the Glen, Castle, Holt's, and other lines should go faster than mail steamers, though we doubt whether an average speed of 12 knots ought to be asked for from a permanent service, which a mail service must be above everything. We think the difference might fairly be split, and eleven knots an hour asked for and given. One thing we most earnestly trust, and that is that the old P. & O. will retain the contract. Though 'business is business' still there ought to be enough gratitude left in British merchants' minds to so far override that condemnably selfish axiom as to give a preference, at all events, to servants who have done their work for them so well and so faithfully as this magnificent Company.

Every movement of Russian or English men-of-war is now watched, of course, with the greatest interest; so that the departure of the *Modeste* and *Egeria* last night has given rise to much speculation and many rumours. 'The Admiral has received news that war is to be declared to-morrow'—'four Russian ships have slipped over to the China Coast' &c., &c. There is no doubt that the situation is most grave and war more nearly imminent than ever, and that the English Admiral has his squadron,—ship, men and material, in readiness for instant action. British mercantile interests in the China Sea are of great importance and of course our gallant friends the Russians, as soon as a telegraphic message makes them suddenly our enemies, will do their best to damage those interests. The capture, destruction, or imprisonment in neutral ports of every Russian vessel now at large, of course every Englishman must recognize as inevitable, but that they will do a certain amount of damage before they are got rid of is equally so. Perhaps the best estimate of this 'certain amount' is to be found in the 'war risk' now charged on marine policies of Insurance in England—half-a-crown per cent!

From China we continue to receive accounts more and more horrible and heart-rending of the progress of the famine. The stricken districts are literally bare of food and the people are become cannibals; and men are killed for the little dreadful sustenance remaining on their almost fleshless bones. Around these districts food gets scarcer and scarcer, as those who can do so, drag themselves from the places where there is absolutely no food, to those where there is a little. Pestilence, in the form of typhus fever, is also slaying the people by thousands and actual depopulation of large portions of the North and North West is the only end that can be looked for. We read in history, ancient or modern, of no such famine. A hundred and thirty millions of people are suffering, in greater or less degree, from absolute starvation to severe privation. Trade is dead; money appears to have vanished from the country; the Government awakes to its duty too late to help and private charity stands appalled before such a calamity, with its mite in its hand that cannot give a single meal a piece to a hundredth part of the sufferers. Such are the consequences of despotism, neglect and misrule.

We hear that the *Shanghai Evening Courier* has changed hands, and is to be run as a daily morning paper. The journal is said to have been bought by Mr. Drummond, a barrister, in Chinese interest and the price paid for it is stated to have been twelve thousand taels. It is quite time that the *North China Herald* had some intelligent opposition; it has itself been very sleepy for a long time and badly required a stimulus.

The second performance of *Atchi* and *Trial by Jury*, on the 13th inst., for the benefit of the General Hospital, completely justified all that we wrote last week. Every one played and sang their part with more confidence, and many little roughnesses of detail were smoothed away. Company, orchestra, audience, were all in perfect accord, and the performance of both pieces showed an advance. Notably may be singled out Mr. Hay's acting of the valet's part in the first piece, in which he completely changed his reading, to the manifest improvement of the general effect, with which his first, in which he followed the stage directions, was quite incongruous. Mr. Pearson, on the other hand, in *Trial by Jury*, persisted in acting his part in his own way, and again leaving the bench for the footlights as on the previous occasion, in opposition to precedent and to all his critics. Mr. Pearson is an actor and musician of some experience, and even though against a *consensus* of objection, has of course a perfectly good right to maintain his own reading, if he likes; but as a matter of fact, it was remarked on Saturday that his voice was heard from the very back of the house quite distinctly, when he was singing from the bench; whereas it was blurred and indistinct, in his patter song, when he came down to the lights. We understand, of course, the special reasons which may have induced him, here, to adhere to his first reading; but Mr. Pearson is too good an actor not to appreciate the truth that the *Judge's* part should be played with more dignity and when he repeats it elsewhere, no doubt he will alter his reading.

In another column will be found the entries for the First Meeting of the new Racing Association, the Yokohama Jockey Club. We are sorry to remark that native-owned ponies are conspicuous by their absence; so much more interest was given to the last Association Meeting by their competition, that we were looking forward to welcoming some more of his Majesty's stud on our course. We hear that some dissensions in the Imperial stable are the cause of their absence on this occasion, and perhaps the absence of their foreign trainer has something to do with it. We must live in hopes of seeing them come out in the autumn.

By far the most remarkable event of the week has been the publication, by the *Nichi Nichi Shimbun*, of a letter from Iwasaki, Chief Director of the *Mitsui Bishi* Company, of which we give a translation below, taken, by permission, from the columns of the *Japan Gazette* :—

"During many years we have carried on our business in the face of great trouble and difficulty. We have been successful in causing the removal from Japanese waters of the vessels of both the Pacific Mail and Peninsular and Oriental Companies. We are always desirous to extend our business; but times are not good, and things are not as we should wish them to be. But, this notwithstanding, we cannot shirk our responsibility, nor make little of the desires of our fellow countrymen. This is how matters stand. Nothing will abate our zeal for the promotion of national navigation. The Rising Sun flag shall soon float on the Pacific; and lines of Japanese mail steamers shall circumnavigate the world. Of this we have already assured our friends. Still, a great difficulty impedes our progress; and will do us much injury. As the prosperity or adversity of our Company is not merely a question concerning ourselves individually, but also vitally affects the public, it is to their interest to protect and foster our enterprise. By doing so they will promote the welfare of the country and their families. To this we wish to direct your attention.

"Since we opened the Shanghai line, we have sustained continual loss; but thanks to the kind encouragement and aid afforded us by the Government, we are not discouraged, and persevere in our endeavours to promote, as far as we can, the public weal. At the present day it does not appear as if we could continue much longer, for the following reasons. We lost 72,000 yen during the months of December January and Feb., last. This means a loss of 300,000 yen *per annum*. Nor is this all. The Hakodate line entailed a loss upon us of 14,000 yen, and that of Koki 3,130 yen, per month, during the same two months. And we derive no profit from the other lines.

"When the civil war broke out last year, our vessels were chartered by the War Department for the public service, to the great inconvenience of private shippers of goods, and consequent falling off in the commerce of the country. Then, as was our duty, we raised a loan of one million yen, with which we purchased steam vessels from foreigners to supply the demand of the public, to whose convenience we thus ministered. And when the war was over, there was no freight for these vessels, which are laid up in great numbers. So we must expect to undergo considerable loss, which we can only hope to recover by one *coup*.

"The Osaka-Hakodate line is a very important one. During the winter season it was temporarily closed; but it will be re-opened about the middle of April. Now, it happens that people on the coast are in the habit of sending their goods in junks, little appreciating the accidents which are likely to occur; and, thus this line may also turn out a source of loss to us. Regardless of this, however, we must open it.

"As regards the Shanghai line, we were subject to serious competition; since the cessation of which no reform has been made; and we shall shortly have to raise freights to a proper point. Nothing but an extraordinarily high rate of freight can ensure us against loss.

"From the above, it will be seen that we are in a position of great difficulty and grave responsibility. What then is the best way to fulfil what our countrymen require of us? It is this. We must decrease our expenditure, and we and those associated with us must proceed with all caution in our difficulties and embarrassment. Now is the time to try the wit and capability of the members of our Company. We will entirely change our system, and take the most strenuous measures for the protection and preservation of our business. If we succeed not, we will offer ourselves a sacrifice to public and private welfare. An old adage says that no demon can stop the progress of him who has sternly set his heart on the accomplishment of his object. Nothing is difficult to a high-spirited man. What our associates require is merely courage. If any one can suggest a good method of overcoming present difficulties, we shall be obliged to him. Meanwhile we repeat that the prosperity or decay of our business is matter of grave concern to our country and its people."

This Report, for—though unaccompanied, as it by should be, any properly drawn-up, and duly authenticated accounts—a Report we must call it, is of too important a nature to receive more than quotation in this column, usually dedicated to gossip. We pay due attention to it elsewhere, but we can hardly avoid recording here a threat that we may possibly soon be left without regular means of communication with other parts of Japan and China.

In our last we mentioned the predictions of several old friends of ours in the Marine Battalion which left us a few years ago: we

notice now in the home papers that Dr. Orton of the 10th Regt, has been made Surgeon-Major and is appointed to the charge of the medical service on the West Coast of Africa, having his headquarters at Sierra Leone. Popular prejudice is so set against this settlement, that few, perhaps, would be inclined to congratulate Dr. Orton very fervently on his appointment: but we have known men—and not lunatics—who have asserted that Sierra Leone is much maligned in the matter of climate,—that if people would only take ordinary precautions, they would be all right; but that, in fact, as the Irishman said of his Calcutta friends:—'they ate, an' they dhrink, an' they die—an' thin, they wr-rite home an' say the climate does n't agree wid 'em.'

NOTES AND QUERIES.

QUERIES.

Qy. 6. Can any of your readers inform me whether there are any, and if so, what books on Japanese surgery, or midwifery, as practised before the coming of the Dutch and Portuguese? (Unanswered.) Z.

Qy. 9. I want information as to the locality of the signature of the original Treaty with Japan by Commodore Perry. Treaty Point, a mile or so away from the town indicates the spot: but was the treaty signed there in the Temple at Homoko, near which the butcheries now stand; or was it under a group of trees which stood on the site of the present British Consulate? I have heard both places assigned as the scene of the transaction. (Unanswered.) B. A.

Qy. 10. Can any of your medical or other readers inform me of the recent existence of cases of poisoning resulting from the use of bread made from impure wheat; the symptoms being those described in works on Medical Jurisprudence, as arising from the presence of the *Lolium temulentum* or Darnel grass (or other poisonous *gramineæ*) viz; Gastro intestinal derangement, narcotism, vertigo and convulsions. R. N.

THE TIMES OF TAIKO

(FROM THE JAPANESE.)

BY F. BRINKLEY, CAPT. R. A.

ISHIKAWA GOYEMON.

Chapter XVI. RETRIBUTION.

AT sunset Ishikawa left Kiyoto and set his face resolutely towards Fushimi. If his inability to forecast all the circumstances of his undertaking had caused him a moment's uneasiness in the quiet of his home, his feet had scarcely crossed the threshold before his old friends, self-reliance and unflinching courage, came back stoutly to their places, and whispered rebukes to his late faintness. Angry and grieved that he should have suffered Chiyo's disquiet to betray him into ill-omened and unnecessary words, he now burned with impatience to carry her the news of successful achievement, and this feeling, added to the great interests that depended on his enterprise, developed such a fullness of resolute energy as had perhaps never accompanied him in any of his previous adventures.

It is worthy of note that he did not give a second's thought to what most men of his time would have contemplated with the gravest apprehension. The story of the censor's miraculous properties had long passed into a household tradition. That its cry had saved its owner's life on two occasions was now a matter of history: once when the boatman Yojihei had almost stretched out his hand to poison the sleeping Regent, and again when another moment would have imprisoned Taiko in the hold of a sinking ship. Opposed to such an adversary, disloyalty, even were it sufficiently adroit to surmount all other difficulties, could not surely hope for success, and yet the abstraction of this very censor was the object of Goyemon's undertaking. If he was sufficiently credulous to attribute a controlling virtue to the crimson brocade he carried in his bosom, his superstition must assuredly have found something disquieting in the encounter of these supernatural influences, but it seems much more probable that, while obedient to certain forms which helped

to enhance the value of his services, he in reality derided his porcelain enemy as much as he despised his silken ally, and would have laid a naked hand or a brocade envelope on the sacred censer with equal indifference.

The castle at Fushimi was surrounded by a double line of moats. Of these, the inner was in the shape of two equal concentric ellipses with their long axes crossing each other at right angles, but the outer was irregular, sometimes following the configuration of the ground, sometimes the freak of the engineer, and at one part of its windings, it had been widened out to the base of a little hill sparsely wooded, at the foot of whose steep slope the waters of the fosse formed a miniature lake, bathing also the pillars of a lofty barbican that stood at the distance of a drawbridge from the scarp. Just opposite this barbican, the inner moat presented one of its salient points, and since the traces of the two enclosures were not mutually adapted, it so happened that they approached each other closest at this spot.

It was here that Goyemon elected to commence his enterprise. From the summit of a pine that crowned the hill, he was able to examine the ground between the two lines of battlements, but the darkness—for the moon was old and the sky clouded—prevented him from discerning more than the dusky mass of the huge wall forming the scarp of the inner moat. He succeeded however in assuring himself that the drawbridge was up and the barbican unoccupied.

Threading his way through an entanglement of azalea bushes and bamboo grass, he reached the counterscarp—here scarcely raised above the water's level—and then, taking off his clothes, he tied them, together with his swords and the rest of his apparatus, into a bundle, which he placed in the cavity of his large, mushroom-shaped hat. This he launched like a boat on the fosse, pushing it before him, and sometimes wading, sometimes swimming, soon reached the foot of the barbican.

His object was to lie concealed in the tower, and take advantage of an interval between the rounds of the watch to effect the scaling of the scarp and the gate beyond the drawbridge. But it seemed impossible that he could ever climb into the barbican, for the huge wooden posts that supported it, were square, sharp-edged and overgrown with slippery mosses, while the lowest girder was fully ten feet above his head. At one corner, however, the water was sufficiently shallow to afford a footing, and planting himself firmly, he adjusted the grappler attached to his silk line, and slung it with marvellous dexterity through the oaken bars of the barbican gallery. Falling within, their own weight released the iron fingers, so that when the grappler was drawn back, it clutched the bars firmly inside, and Goyemon, with his dirk between his teeth, ascended the rope, cut himself a passage through the bars and drew up his bundle after him.

He now commanded the whole enclosure, and could even see the lights in the part of the castle occupied by the Regent.

At midnight the watch passed. From that time he might reasonably count on two hours of undisturbed solitude. Long as the interval was, however, experience told him that unless some happy accident facilitated the ascent of the inner scarp, but a very brief space would separate him from detection at the moment of crossing its battlements. The utmost despatch therefore was essential.

But here a grave difficulty occurred. In lowering his hat and its freight a second time to the water, he discovered that only a very few feet of slack remained in his hand, and since, in order to release the rope from the bars after descent, it would be necessary to double it and slide down with both ends hanging free below, he saw plainly that the fosse could only be reached by a drop, formidable and perhaps disabling in its results. Nevertheless he did not hesitate an instant, for the fact that this peril was due to his own improvidence made him almost impatient to encounter it. Choosing a spot where he believed the water to be deepest, he slid rapidly down, and holding the grappler firmly, let go the other end of the rope.

He rose unhurt to the surface, but the stillness of the summer night was so disturbed by the splash of his fall, that prudence obliged him to wait some time before proceeding with his enterprise. It was hardly possible, he thought, that observation could be entirely unattracted, and scarcely, in truth, had he swum to his old standing-place, when a sound of voices reached his ear, and lights began to move across the loop-holes of the battlements.

It was not too late to recross the moat, had such an idea

occurred to him, but the habit of his nature made device or daring easier than retreat. Crouching therefore behind the barbican pillars, he smiled as he marked how the pitchy gloom shortened and blurred the beams of the lanterns. So little disturbed, indeed was his accuracy of observation, that before the bars of the gate opposite the barbican were drawn back, he was able to be certain of finding himself beyond the circle of light.

Four soldiers of the guard stood peering across the water, so close that their features were almost distinguishable. But their scrutiny was not very keen, for seeing nothing, they were apparently persuaded there was nothing to be seen, and three of them had already repassed the gate, when the fourth, lowering his lantern beside the buttress of the bridge, recalled his comrades excitedly.

The water was still plashing lightly against the stones of the scarp.

Then for the first time Goyemon turned his head towards the hither side of the moat; not yet, however, despairing, for he said to himself:—"Among three who have not been sagacious enough to observe, there will surely be some too sagacious to believe."

And he was right. Two of the soldiers proposed to lower the drawbridge and visit the barbican, while two scoffed at the idea and refused to give any assistance. At last they compromised the matter, agreeing to return to the guard-room by a path that wound along the face of the rampart; the result of this patrol to determine which pair should come back to bar the gate.

Long before the issue of this arrangement, Goyemon was standing up to his neck in the water of the second fosse close under the counterscarp. From the very verge of failure, he had suddenly passed almost to the certainty of success, for not only had an accident opened the gate for him, but he now made an unexpected and most opportune discovery. A scaffolding had been erected for the purpose, apparently, of repairing the inner battlements. Its feet sprang from a point half way up the scarp, and its long timbers afforded an easy solution of a very serious difficulty—the scaling of the battlement eaves.

Whatever courageous skill Ishikawa had shown in the conduct of his enterprise up to this point, was now marred by an act of unfruitful and incredible recklessness, for when he reached the grounds immediately outside the Regent's apartments, he seated himself on a rock beyond the shadow of any tree or hill, and remained for nearly an hour, listless and inert. He forgot his position, forgot his purpose; forgot the dangers he had just surmounted and those he was about to encounter, and there, in the castle garden, within arm's length of discovery and death, while the rising moon, fragile and pallid, hid herself shyly in the clouds' recesses, and the night wind stirred the melancholy willows, the memory of Chiyo as he had last beheld her, visited him like a whisper from the land of spirits. He saw her, the sunbeam that brightened life into a jewel, the angel that made fidelity a truth; saw her sweet face so close, so life-like, that he had almost stretched out his hand to touch it, when slowly and regretfully it faded and vanished into a darkness from which he knew it could never return: vanished like the impress of a leaf on a stream, and in its place a deep, inviolable stillness, a stillness unlike anything this man of nerve and action had ever before felt or fancied, crept up and isolated him from existence and reality. He had no consciousness of anything near at hand: castle and rampart, sword and shrubbery disappeared from about him, and all his senses were absorbed into an illimitable distance, stretching farther and farther away as he contemplated it, until at last, in the intensity of his gaze, forest cloud and mountain seemed to start into a monstrous rigidity, mocking the soft moonlight and embodying the first fear that had ever stayed his pulses.

There is a fable that tells of a ghastly atmosphere hanging on the horizon of time; a dank atmosphere heavy with vapours of death and decay, and clinging so densely about the throne of fate that her hands sometimes by hazard waft a portion towards the victim she beckons, and forthwith, at the touch of this enchanted air, his senses sinking into a mystery of melancholy, voices of love are changed to sighs of sadness, and loveliness looks at him through tears of loss. And there is also another and a brighter legend, which teaches that there are moments on the confines of existence, when like a smile breaking over the face of a child in slumber, some consciousness of coming release stirs and quickens the soul into such a fine sensibility that it gathers to itself

all the beautiful and sinless retrospects of life, and weaves them into a vision, mystic, many-hued, fair and attractive to our immortal sympathies, but wrapping all that is mortal in a mist of miraculous and ineffable sadness.

The condition of our intelligence must be largely modified before we can determine how much of truth or fancy these fables enfold, for they point to a phase never twice visiting the same existence, and so far beyond the reach of human conception or understanding, that no language of man has ever pictured, or will ever picture, its faintest outline. It would seem as though, leaning over the brink of time, we discover, reflected far down in the depths of eternity, an image of the past, shadowy but unmistakeable as the features of a dead friend seen across the cerement that half hides, half defines them; and even while we gaze, the fathomless infinity of the medium confuses and stuns our senses, till the image sinks out of sight, and our hopes and designs become irrevocable portions of the period it represented.

Roused from his reverie by the crowing of the castle gamecocks, Goyemon painfully struggled back to the realities of the present. He laughed as he marked how long the moon had been his own and the Regent's only watcher; and rising from his seat, stole stealthily round to the most southerly angle of the building before him. Passing under the eaves, he found that the rain-doors were of great strength, but to facilitate their change of direction from face to face of the verandah, the outer edge of the groove in which they travelled, had been removed through half the length of a shutter on either side of the corner. It was only necessary, therefore, to cut away the remaining half, and the shutter would become removeable from without, provided it was not held by some of the bars or bolts with which these more accessible points were generally provided. In this case, Goyemon's good-fortune befriended him, or perhaps his experience enabled him to make a happy selection, for when his dirk, strongly and skilfully wielded, laid bare the bottom of the groove, the shutter came away in his hands without any difficulty.

He found himself in a long, sombre verandah, separated by a balustrade from a corridor, matted and bounded on its inner side by a series of doors with wide lacquer margins and pictorial panels. These were not fastened, and when Goyemon passed through, he saw that his calculations had guided him perfectly, for into the space where he now stood, projected a raised threshold, overhung by bamboo blinds, through which the objects within were faintly discernible in the light of two night-lamps. This was the threshold of the Regent's sleeping chamber.

It was then that Goyemon showed how little the Lapwing-censer's miraculous attributes disturbed him, for only hesitating long enough to accustom his eyes to the dim light, he drew one of the blinds forward, and glided behind it with the tabard still folded in his bosom.

Taiko was sleeping quietly, but the heavy breathing of the guards was audible from the rooms beyond.

Goyemon took up one of the lamps, trimmed it and walked deliberately over to the Regent's side. A tripod of embossed-red lacquer stood near the edge of the silk coverlet. Its lower shelf supported a jade vase containing two half opened lotus flowers, and its upper, a porcelain censer, upon which a Lapwing with unfurled wings was in the act of alighting.

Whether imagination offered an involuntary tribute to the modeller's exquisite art, or the tremulous flicker of the taper imparted a quiver of vitality to the bird's plumage, it seemed to Goyemon, as he gazed, that the Lapwing gradually changed its aspect of incipient repose for one of growing disquiet. It raised itself slowly on its long legs, its wings unfolded wider and wider, the feathers of its crest stirred, and already its throat began to be dilated by the note of alarm, when the folds of the silk tabard fell rustling around it, and Goyemon muffling it in ply after ply of the thick brocade, transferred it rapidly to his bosom.

Then, as if to atone for this transient perturbation, he moved a lantern close to the Regent's couch and stood quietly contemplating Taiko's face. It may well be that the reflections which engrossed his mind at that moment were the secret agents of fate, aided by his own inimitable recklessness. Errand-boy, sandal-bearer, Prime Minister and Regent: how small was the marvel of this sleeper's greatness compared with the unparalleled littleness that had preceded it! Could success then so completely erase the past from the world's memory that men saw nothing in this vulgar sunshine but its brilliancy? If it were indeed so,

what limit need be set to the sequel of this night's adventure? With the dignity he was about to win, with the riches he already possessed, with the faculties that had hitherto made failure impossible, might he not reasonably hope to reach even farther than this upstart, whose life the swimming of a fosse and the scaling of a battlement placed at a robber's mercy? Even as a porcelain censer separated Hidetsugu from the Regency, so the three sacred insignia alone stood between the Emperor's throne and any noble of his court. The mystic red jewel, the mirror of the goddess Izanami, and the sword that Susano-O drew from the tail of the Hydra, had no more ability to guarantee themselves against removal from the Imperial fane than this china bird to preserve itself on its lacquer tripod.

Looking down from the pinnacle of these lofty conceptions on the contemptible features of the sleeping Regent, Goyemon, stirred by mirthful disdain, laughed aloud as he turned and passed outside the bamboo blinds. There, deprived suddenly of the light, he stretched out his arms and groped his way across the space that separated him from the corridor, but even as he touched the cedar doors, he felt his wrist encircled by a powerful grasp.

Something in the contact of the hand that held his, told him its action was in great part accidental. Evidently the encounter was equally unexpected on both sides, and everything depended on anticipating his adversary. Instead, therefore, of attempting to release his wrist, he bent forward, and with an accuracy marvellous under the circumstances, clutched his opponent's throat, at the same time pushing him backwards into the corridor.

Up to that moment, neither of the men had uttered a sound, but now a hoarse groan disturbed the silence, as the life of the one was slowly crushed out by the iron grip of the other. Across the corridor, then to the right along the balustrade, down the steps one by one into the verandah, and again to the left towards the open corner, pace by pace the two passed, Goyemon half pushing, half carrying his antagonist, whose weight became every moment heavier in his hands.

Nothing could have furnished a better example of Ishikawa's implicit confidence in his own strength, than the fact that, the moment his fingers had fairly encircled his adversary's throat, he determined how to dispose of the dead body. It should be thrown over the battlements, for if left in the grounds, its discovery might abridge the time necessary for escape.

A slender stream of moonlight was flowing in through the displaced door, and as its silvery waves fell on the face of the dying man, they seemed, like the touch of some magical elixir, to change his distorted features into the lineaments of an old, old friend. Time and sorrow had whitened his head and furrowed his brow, but there, beyond the possibility of doubt or mistake, were the eyes that for many a year past had looked reproaches through dream and reverie, the lips that had whispered curses in the ear of conscience.

Goyemon, recognizing Momoji Sandayu, relaxed his hold and hid his face with a cry of horror and remorse. Benevolence requited by the darkest treachery, hospitality repaid by robbery and murder, fair friendship marred by foul dishonour; these were the witnesses that rose up at that moment of supreme pain, and seared their testimony in letters of fire on his brain. Had the Regent's guards sprung upon him then, he would have yielded without a struggle or a sigh, but his action had been too silent and too quick, to disturb the careless soldiers' repose. The road to escape still lay open and easy.

He rose to his feet—for he had kneeled beside the body of his victim—and with averted face, stepped towards the open door. But the burthen of his regret was too heavy to permit successful flight. At the instant of descending into the garden he was seized by an uncontrollable desire to assure himself of Sir Momoji's condition. He turned back, and bending over the body, found, not the discoloured features of death, but Sir Momoji's eyes fixed painfully on his own.

The two men gazed at each other for a moment in silence, and then the knight, all his forces restored by the sight of his mortal enemy, threw himself forward and encircled Goyemon's knees in an embrace of desperate energy.

Though he carried in his girdle an immediate means of release, Goyemon, without touching his swords, stooped down and sought to unlock Sir Momoji's fingers, but the old knight, knowing well the enormous strength he had to deal with, twisted and writhed so as to elude his opponent's grasp, and now set himself to shout loudly for aid. Then Goyemon

THE JAPAN TIMES LAW REPORTS. No. III.

IN H. B. M's. COURT AT KANAGAWA.

Before H. S. WILKINSON Esq. Acting Law Secretary
and a JURY.

THE IMPERIAL JAPANESE GOVERNMENT.

v.
F. A. COPE AND W. P. MITCHELL.

1878 } THIS was a suit promoted by the Japanese
Feb. 28. } Government to recover possession of a piece
of land held by the defendants as portion of lot 95; but
which was alleged by the plaintiffs to be wrongly held by
them.

The defendant Cope, by his answer, averred that the defendants were grantees of the piece of land in question under a title-deed granted by the plaintiffs and dated 29th January 1862, and further pleaded that since the said grant, this lot of land had been frequently sold and resold, with the knowledge and consent of plaintiffs, and that such transfer had been admitted and registered by them in the land office of the *Kencho*.

Mr. Kirkwood for the plaintiffs.

Mr. Cope in person.

Captain Purvis holding a power of attorney for the defendant Mitchell.

Owing to the difficulty found by the Court in determining the points in dispute, as on the pleadings the parties were not at issue, the petitions and answers were abandoned, and the parties went to trial on the following admissions and issues.

Admission 1.—It is admitted that a lease of lot No. 95, in the foreign concession at Yokohama, was given by the assignors of the defendants on the 29th day of January, 1862, and that the defendants are now in possession of said lot under said lease.

Issue 1.—It is alleged by the plaintiff and denied by the defendant that the portion of the ground marked A. in the plan annexed to the petition was not part of the ground demised by the said lease.

Admission 2.—It is admitted that the defendants are now in possession of lot No. 95, as marked in the said plan, and the portion marked A. in the said plan.

Issue 2.—It is alleged by the defendants and denied by the plaintiff that the defendants and the assignors of the defendants have been in undisturbed possession of the said piece of ground marked A. on the said plan from the 29th January, 1862, until the commencement of this suit, and that the alleged cause of action did not accrue within twelve years before this suit.

Issue 3.—It is alleged by the plaintiff and denied by the defendants that in the year 1875 the plaintiff Government made an entry upon the said portion of land marked A and thereby took possession of the same.

Admission 3.—It is admitted that since the first of January, 1865, up to the commencement of this suit, the defendants and the assignors of the defendants have been in undisturbed possession of the said portion of ground marked A in the said plan.

Issue 4.—It is alleged as a matter of law by the plaintiff and denied by the defendants, that even although the said alleged cause of action may not have occurred within twelve years before this suit, the plaintiff is nevertheless not debarred by the lapse of time from recovering in this suit.

Issue 5.—That in January, 1876, and long prior thereto, the portion of ground marked lot No. 95 on the said plan and the portion of ground marked A on the said plan were generally reported to be included in and from lot 95 in the foreign Concession of Yokohama, and were known by the plaintiff Government to be so reported, and the defendants in the month of January 1875 purchased the said lot 95, in the belief that the said lot included as well the portion marked A as the portion marked lot 95 on the said plan; and, in consequence of such belief paid more for the said lot than they would otherwise have paid; and possession of the said portion of ground marked A was given to the defendants by the vendors of the said lot in pursuance of such sale, and the plaintiff well knew that such possession was given.

Admission 4.—It is admitted that it is a condition of the said lease that every transfer of the said lot should be re-

ported to the plaintiff Government for the registration of the transaction. That the said lot was purchased by the defendants in the month of January, 1875, and transferred to them on the 6th of February, 1875, and that the transfer was so reported and duly registered by the plaintiff on the 10th of February 1875.

Admission 5.—That at the time of the transfer of the said lot to the defendants there was no visible boundary between the portion of ground marked lot 95 on the said plan and the portion of ground marked A on the said plan, and that there was then standing on the said portion of ground marked A a stone godown of considerable value.

Admission 6.—It is admitted that as well the portion of ground marked No. 95 on the said plan, as the portion marked A on the said plan, so far as the defendants are entitled to the possession of the same, are held by the defendants from the plaintiff Government, and so much of the same (if any) as the defendants are not entitled to, ought to be delivered up to the plaintiff.

Issue 6.—It is alleged by the plaintiff and denied by the defendants that the plaintiff had not, prior to the month of March, 1875, any knowledge that the portion of ground marked A on the said plan was in the possession of the defendants, or that there was at the time of such sale to the defendants no visible boundary between the portion of ground marked lot 95 on the said plan and the portion of ground A on the said plan or that any buildings were then erected thereon.

Admission 7.—It is admitted that the lot now in the occupation of the defendants, including the portion marked A, contains 535 *tsubo* and that in the title-deed it is described as 401.

It appeared by the evidence, that the official map of the Settlement was lost, when the *Kencho* was destroyed by fire in 1866. Some of the account books containing the accounts of rent paid for the land, had been saved; and copies of account books which had been kept at the Tobe office of the *Kencho*, were put in. These copies were made from the originals in 1866 by officers of the *Kencho*; the originals could not be traced; they had been sent to the office of the *Gaimusho* in Tokio, but were now missing. The copies were admitted, on the ground that they were copies of public records made by officers in the execution of their duty.

From these accounts, and from evidence produced on their behalf, the plaintiffs sought to show that the land on which the Settlement of Yokohama is now built, was appropriated to the use of foreigners in the year 1859, that in that year, the said land was surveyed and portioned out into lots, that the lot 95 and the lots 94, 93, 92 and 91 abutting thereto on the south side were laid out with frontages of equal length of 20 *ken* each and that this arrangement of the lots remained unchanged. That in the year 1862, when the lot 95 was first granted to Mr. Elmstone, it contained 401 *tsubo*, and that the ground rent thereon was 112 *rios*. That in 1859 and up to 1862, there had been a roadway between the lot 95 and lot 76, the adjacent lot on the north side; and that this roadway had been appropriated by one of the predecessors in title of the defendants, and formed the portion of the ground now held by defendants in excess of the extent of the original lot. The mayor of the village of Yokohama, at the time of the forming of the Settlement, and many Japanese who knew the settlement in its early days, spoke to the existence of the road, or pathway as it really was, but they differed very much as to the width of the path, and could not speak with any certainty of the time when the path ceased to be used. The path, even in the earliest days, was overgrown with high grass and reeds and was very little used; from the time that any attention had been paid to the making or repairing of roads in the settlement, none of the witnesses could speak to the existence of any pathway near the locality.

The defendant Cope contended that, from the time of the original grant of the lot in 1862, there had been no road or pathway between lots 95 and 76; that in the latter part of that year, or in the beginning of 1863, there was a house erected on the spot where defendant's godown now stands (this godown is admitted to be on the space where the pathway was said to be) and it was finally admitted by plaintiff's counsel, that the road was closed before April 1863. Many foreigners who had known the Settlement from 1861 were called to prove that they were well ac-

quainted with the lot in question; that they had no recollection of the pathway between the lots 95 and 76. It was also shown that there was originally a racecourse or riding ground adjoining the western extremity of lots 95 to 91, which had been for a long time disused, and the ground thereof incorporated with those lots, with the sanction of the Japanese Government. The title deeds under which he held the lot were put in by defendant Cope. The endorsements of registry on these showed, that at the time of the purchase of the lot by defendants in 1875, the said deeds were left at the land office of the *Kencho* for registration, and the transfer of the lot with the buildings thereon as they then stood was duly registered.

His Honour in charging the jury, put to them sixteen questions for solution: these questions with the finding of the jury thereon were in the following terms:—

Question I.—“Was the whole, or any part, and if so, what part, of the piece of ground marked A in the plan annexed to the petition a portion of the ground described in the title deed of the 29th January 1862, as lot No. 95?”

Answer:—“We find that a piece of ground marked A was a portion of the ground described in the title deed of 29th January 1862 as lot 95, and that such part measured twenty-four feet or four ken, extending from the portion of ground marked lot 95 in the plan, towards lot 76, and also extended to the rear of the lot (now called Homura Road) for one hundred and twenty feet, or twenty ken, such piece being a rectangle of 24 by 120 feet, containing two thousand eight hundred and eighty feet superficial, or eighty tsuobes of ground.”

Question II.—“Is there any part and what part of the portion marked A of the said plan which was not a portion of the ground described in the said title deed as lot 95?”

Answer:—“We find that the space within the ink-line in the above diagram measuring on the respective sides 9 feet and 146 feet, 34 feet, and 30 feet, 24 feet, and 120 feet, (containing say: 55 tsuobes of ground,) forms the portion of A not included in the said title deed as lot No. 95.” (A diagram accompanied this answer.)

Question III.—“When was such part of the piece of ground marked A which was not included in the ground described in the said title deed as lot 95 first included in the lot 95 as now known, and by whom, and was it so included with the knowledge and consent of the plaintiff Government?”

Answer:—“We find that the portion of that part abutting on the Homura Road was incorporated with the lot at the same time that the neighbouring lots (say 91 to 94) were extended to the Homura Road, and that such extension was known to the land officers of the Government. The exact date when the extension took place we cannot say, but we find that it took place after the making of the Homura Road, and that according to the evidence the road was in process of construction in June 1862. We cannot say by whom this portion was incorporated in the lot. We find that such extension took place not later than 1st April, 1863. The remaining portion, abutting on lot 76, was incorporated with the lot at some time prior to the 1st April 1863, for we find on that date Mr. Goble residing in a house which partly stood on this then strip. We find that the portion was included in the lot with the tacit consent of the Japanese Government, but the exact date and name of person incorporating the strip we cannot say. We find that both portions were so incorporated by either Mr. Elmatone or Mr. Stearns.”

Question IV.—“Did the assignor of the defendants build upon the portion marked A on the plan annexed to the petition the building or buildings now standing on that portion in the genuine belief that the whole of the ground upon which such building or buildings was or were erected was his own. If so, describe that building or those buildings?”

Answer:—“We find that the assignor of the defendants did build upon the portion marked A the building now standing on that portion, in the genuine belief that the whole of the ground upon which such building was erected was his own. We find that such building is a stone godown now used as an auction-sale-room by the defendant Cope. We find that the said godown was erected in 1872.”

Question V.—“Was the plaintiff Government or its officers and what officers aware that such building was be-

ing so erected? And if so did the said Government or its officers make any objection to such building?”

Answer:—“We find that the plaintiff Government was fully aware in the year 1870 of a godown already erected on the site of the present auction room; and we also find that on the re-erection of said building in 1872 the plaintiff Government made no objection whatever to said re-erection.”

Question VI.—“Was the plaintiff Government prior to 1872 aware of its rights with regard to the part of the piece of ground marked A not included in lot of ground described on the title deed of 29th January 1862 as lot 95 and if so when?”

Answer:—“We find that the plaintiff Government was aware of its rights with regard to the part of the piece of ground specified in the question at the granting of title deed on 29th January 1862. And they continued in such knowledge up to and until the time when they tacitly allowed the erection of Mr. Goble's dwelling house upon the ground some time prior to the 1st April 1863.”

Question VII.—“Was the whole or the portion of ground marked A in the plan annexed to the petition as well as the portion marked lot 95 on the said plan, in December 1874 and in February 1875 and long prior thereto, and generally reputed to be included in and upon lot 95 in the foreign Concession at Yokohama?”

Answer:—Yes, it was so reputed.

Question VIII.—“If so, were these portions of ground known by the plaintiff Government in December 1874 and February 1875 to be so reputed?”

Answer:—Yes, they were.

Question IX.—“Did the defendants between December 1874 and February 1875 inclusive, purchase lot 95 in the genuine belief that the said lot properly included as well the whole of the portion marked A as the portion marked lot 95 in the said plan.”

Answer:—Yes, they did.

Question X.—“Did the defendants pay a valuable consideration for the said lot? and if so, what consideration?”

Answer:—Yes, they did pay a sum of not less than eleven thousand dollars Mexican and not exceeding thirteen thousand.

Question XI.—“Did the defendants pay more for the said lot by reason of their belief that the whole of the said portion marked A was a proper part of the said lot?”

Answer:—Yes, they did.

Question XII.—“Was possession of the whole of the portion marked A on the said plan annexed to the petition as well as of the portion marked 95 on the said plan given by the vendors to the defendants in pursuance of such sale?”

Answer:—Yes, without doubt.

Question XIII.—“Was the plan of the Settlement of Yokohama purporting to be published in 1870 by order of the Japanese Government, published by order of such Government, and, if so, when?”

Answer:—We find the said plan was published and printed in London by order of the said Government in 1870, and we also find the said plan was sold in Yokohama by their authority in the year 1871.

Question XIV.—“Did such plan induce the belief in the defendants that the whole of part marked A on the said plan was proper portion of lot 95?”

Answer:—Yes, it did.

Question XV.—“Did such plan prevent the legal adviser of the defendants from instituting any inquiries which he otherwise might have instituted as to the existence of any claim by the Government?”

Answer:—Yes, it did.

Rider to answer to question VI:—We find the plaintiff Government was aware of its rights with regard to the part of the piece of ground specified in the question, at the granting of the title deed on the 29th January 1862, and that they continued in such knowledge up to and until the time when they tacitly allowed the erection of Mr. Goble's dwelling house upon the ground some time prior to the 1st April 1863. We consider that plaintiffs abandoned their rights in the said piece of ground at the time of the erection of the dwelling house in 1863.

Question XVI.—“At the time the person or persons incorporated the portion of the piece of ground marked A,

on the said plan not included in the ground described in the said title deed as lot 95, to whom did that piece of ground belong? Was or were the person or persons so incorporating the same aware thereof, or to whom did he or they believe it to belong?

Answer:—The piece of land belonged to the Japanese Government at the time. The person or persons incorporated the said piece; and the land was incorporated with the knowledge of the Government land officers.

On these findings, His Honour left it to either party to move for judgment.

Mr. Cope having moved that judgment might be entered for the defendants, the case came on for argument on the 3rd of April.

Mr. Cope, in support of the motion. The jury have answered 15 out of the 16 questions put to them, in favour of the defendants: as to that one found in favour of plaintiffs, the piece of land referred to by the jury is not the piece of land claimed by plaintiffs in their petition.

Mr. Kirkwood for the plaintiffs. Admitted that he could not have judgment for the whole of the land claimed, but as to the 55 tauboes of ground which forms portion of A, not included in the said title-deed as lot 95, this portion was found by the jury not to have been transferred to the defendants, and for that portion, plaintiffs must have judgment. The defendants at most, are tenants at will to this piece of land, they have no title therein as against their landlord; the equities which restrict the conveyance of lands as between individuals do not apply with the same force against the crown: and the maxim *omnia præsumuntur contra spoliatores* applies. Moreover, the consent of the Government, if consent there was to the transfer of this lot to the defendants, was the act of the land officer only, and there is no finding of the jury, nor is there any evidence to show that that officer had any authority to give consent. A Government is not responsible for the acts of its agents who act beyond their powers. [Story on Contracts p 412.]

Bassett v. Nosworthy, and the cases collected in the notes thereto, in *White and Tudor's Leading Cases in Equity*, Vol. 2 p. 1. do not apply in this case: *Bassett v. Nosworthy* was a case of a *bona fide* purchase in market overt, without notice of encumbrance or equitable title: and all the cases cited and commented upon in the notes thereto, were decisions relating to freehold estates. This case must be governed by the ordinary law of landlord and tenant.

(Mr. H. S. Wilkinson. You have a title-deed granting a lease in perpetuity; what does this constitute?)

Mr. H. S. Wilkinson, Judgment must be for the defendants. It appears to me that the principle of *Teasdale v. Teasdale* Sel. Ch. Ca. 59, as given in *Leading Cases in Equity*, Vol. II, 4th ed. p. 33 applies to this case. I regret that I have not the original to refer to. I do not think it necessary to decide whether Lot 95 is held on a leasehold or a freehold title. I think the principle is the same. The finding of the Jury amounts to this, that the plaintiff Government by its representations induced the defendants to believe that the piece of ground referred to in the answer to the second question put to the Jury was parcel of lot 95, and that the defendants purchased it *bona fide* and for valuable consideration in that belief; and I think the plaintiff Government cannot now say that it is not part of lot 95. Mr. Kirkwood says that although the jury have found that the defendants purchased lot 95 in the genuine belief that the said lot properly included, as well as the whole of the portion marked A, the portion claimed by the plaintiff as the portion marked lot 95 in the plan on the plaintiff's portion, they did not find that the defendants believed that the portion marked A or so much of it as is included in the answer to question 2 was held on the same tenure as the lot 95 in the title deed. I think however that that is the inference to be drawn from their answers. I think I am at liberty to draw this inference and I do draw it.

Having come to this conclusion it is not necessary to consider the defence on the ground of estoppel.

Judgment for the defendants.

IN H. B. M.'s COURT FOR KANAGAWA.

Before H. S. WILKINSON ESQ. ACTING LAW SECRETARY.

HART versus HERHAUSEN.

On the 9th of March 1878 the plaintiff obtained a decree in this court, ordering defendant to pay immediately to the plaintiff the amount of a judgment of H. B. M.'s Court at Hiogo, delivered on the 10th of May 1875 in favour of the plaintiff for \$11,176.70 in a cause entitled "*Hart v. Abell and Herhausen*." The amount not having been paid, plaintiff took out a judgment summons under Sections 129—131 of the rules of H. B. M.'s Supreme Court for China and Japan. The material parts of the summons were:—

"You are hereby commanded in Her Majesty's name to appear personally before this Court, * * * to be examined respecting your ability to make the payment directed, and as to the circumstances under which you contracted this debt or incurred the liability in respect of which payment of the said sum of \$11,376.70 was directed to be made, and as to the means or expectation you then had of paying the debt or discharging the liability, and as to any disposal you may have made of any property previously or subsequent to the date of the said judgment."

The defendant appeared to the summons.

Mr. Kirkwood for the defendant:—This summons must be amended by striking out the words "and as to the circumstances under which you contracted this debt or incurred the liability in respect of which payment of the said sum of \$11,376.70 was directed to be made and as to the means or expectation you then had of paying the debt or discharging the liability," and also by striking out the words "previously or."

He contended that as the rules of Court were issued, and the form of summons framed under them before the Debtors' Act of 1869 was passed; this form of summons is no longer available for the purpose for which it was intended. The Debtors' Act abolished imprisonment for debt, except (under Section 5 of that Act) in the particular cases of defaults made in the payment of money under an order of a Court or Judge, where it is proved that the "person making default, has or has had since the date of the order or judgment the means to pay the sum in respect of which he has made default, and has refused or neglected, or refuses or neglects to pay the same." The right to enquire into the circumstances under which the debt was contracted can no longer be sustained, as they can have no bearing upon the defendant's ability to satisfy the judgment: and can only be sought for the purpose of a committal. If a committal was desired, proceedings must be taken in a very different manner, viz. under part II of the Debtors' Act, which relates to offences by fraudulent debtors.

Mr. Litchfield for the plaintiff:—The objection raised for the defence is as the act of "one who jumps before he comes to the stile:" when an application is made for a committal, it will be time to consider the effect of the Debtors' Act upon the Order in Council of 1865. The circumstances under which a debt is contracted and the disposal by the defendant of the proceeds of the transaction upon which the cause of action is founded, may be very material for the purpose of discovering the defendant's ability to meet the judgment. The Order in Council of 1865 was issued expressly for the governance of British subjects in China and Japan, and is in force until expressly repealed. It is not like an Act of parliament. The Debtors' Act of 1869 does not expressly repeal the Order in Council, and the provisions thereof are in force.

March 27th.—Mr. H. S. Wilkinson, read the following judgment.—

This is an application to strike out certain words from a Judgment Debtor's Summons, issued under Rules 129 and 130 of the Rules framed under the China and Japan Order in Council, 1865. The material part of the summons, as issued, was as follows: [he then read the Summons.]

The words "and as to the means or expectation you then had of paying the debt or discharging the liability" have been struck out by consent; and the words which it is sought to have struck out are "and as to the circumstances under which you contracted this debt or incurred the liability, in respect of which payment of the said sum of \$11,376.70 was directed to be made," and the words "previously or."

As to the first clause which it is sought to have struck out, it is admitted that it is strictly in accordance with the

3rd paragraph of Rule 130; but it is contended by Mr. Kirkwood, for the judgment debtor, that that part of the Rule has been superseded by the Debtors' Act, 1869, and that the debtor can be examined only as to the means he has or has had since the date of the judgment to pay the amount due upon the judgment. Mr. Litchfield, for the judgment creditor, contends that the words ought not to be struck out, because the circumstances under which a debt was contracted are material to show the present ability of the debtor to pay the debt. But I am of opinion that if the Debtors' Act applies to the case, this contention cannot be sustained. The summons ought to contain only a statement of the facts in issue, and not of the facts relevant to the facts in issue, and the only facts in issue, under the Debtors' Act are whether the debtor now has the means to pay, or whether he has had the means since the date of the judgment. Without deciding whether the facts referred to in the clause in question are or are not relevant to the issue: if the Debtors' Act supersedes the Rules, the clause must be struck out.

But Mr. Kirkwood's argument rests upon the assumption that the Debtors' Act, being a statute, overrides the rules framed under the Order in Council. Is this a correct assumption? I am of opinion that it is not. I had occasion in the case of "*Iwasaki v. Colomb*," June 28th, 1877, to consider the law affecting Her Majesty's Jurisdiction over British subjects in this country, and I have seen no reason to change the view I then took. It is unnecessary that I should repeat all I then said. The view I take may, with reference to the question now under consideration, be shortly stated thus. According to the Treaty this case is governed by British law. What that British law is, depends on the provision Parliament of the United Kingdom may have made on the subject; Parliament has made a provision on the subject in the Foreign Jurisdiction Act, 1843, and the effect of that provision is that Her Majesty's subjects residing here are subject to such laws as Her Majesty in Council may impose, to the same extent as persons residing in one of Her Majesty's Crown colonies. In making such laws, Her Majesty in Council may, subject to the controlling power of Parliament, make any laws she pleases, and such laws, except where Parliament otherwise provides, (if there be other exceptions it is unnecessary here to notice them), need not be in conformity with the law of England on the same subject. As to the relative force of such laws, and of Acts of Parliament; Parliament has made provision in the Act. 28 and 29 Vict. c. 63, and the effect of that provision is that such laws when repugnant to any Act of Parliament extending by the express words or necessary intendment of that or any other Act of Parliament to the colony to which such laws relate shall be read subject to such act, and shall to the extent of such repugnancy, but not otherwise, be void and inoperative. But as Her Majesty in Council may, in making such laws, make any laws she pleases, she may of course order that

the law of England shall be the law in any particular case and accordingly in the China and Japan Order in Council 1865, in section 5, it is ordered:

"Subject to the other provisions of this order, the civil and criminal jurisdiction aforesaid shall, as far as circumstances admit, be exercised upon the principles of and in conformity with the Common Law, the Rules of Equity, the Statute Law, and other Law for the time being in force in and for England, and with the powers vested in and according to the course of procedure and practice observed by and before Courts of Justice and Justices of the Peace in England, according to their respective jurisdictions and authorities."

So much then of the statute law of England as is by the express words or necessary intendment of any Act of Parliament extended to British Subjects in this country is binding to the exclusion of the Order in Council, and the rest of the statute law of England is binding only so far as it is not repugnant to the express provisions of the Order in Council.

The question then in the present case resolves itself into this: are the provisions of the Debtors' Act 1869 extended by the express words or necessary intendment of any Act of Parliament to Her Majesty's subjects residing in this country? They are not by the express words or necessary intendment of the Act itself; and I know of no other Act under which they are so extended. There is nothing in the Act itself to show that its provisions were intended to extend beyond England. The 2nd section provides that it should not extend to Scotland and Ireland, and it was not till three years later that the principle of the Act was extended to Ireland. There is no decision that I am aware of, available to me, which shows expressly that the Act does not apply to the Crown Colonies, but there is one on the subject of the Bankruptcy Act with which this Act is so intimately connected. The case of *Benecke v. Whittall* (L.R. 2 App., Cas. 602), heard on appeal in the Privy Council, shows incidentally that the ordinary provision of the Bankruptcy Act 1869 did not (in February 1876) extend to Hongkong, but that the Bankruptcy Law then in force in that colony was an Ordinance of 1864 which adopted most of the provisions of the English Bankruptcy Act of 1861. The ordinary provisions of the Bankruptcy Act of 1869 do apply to Her Majesty's Courts in Japan, but that is by force of the Order in Council and not of the Act itself, and I am of opinion that those provisions, as well as the provisions of the Debtors' Act, are to be read subject to the provisions of the Order in Council, and are inoperative so far as they are repugnant to the provisions of the Order in Council. I say the ordinary provisions of the Bankruptcy Act, because there are certain extraordinary provisions which are expressly extended by the Act itself to all British Courts having jurisdiction in bankruptcy. The clause must therefore stand as part of the summons.

As to the words "or previously," Mr. Kirkwood admits that they must stand on the same footing. The application must therefore be refused.

knowing that the end had come, steadied himself against a pillar, and drawing his long sword, faced the coming danger.

At the sound of the blade gliding from its scabbard, he felt the knight's arms tighten convulsively about his knees, but bending down, he said in a low, beseeching voice: "Sir Momoji, my death may hereafter persuade you to pardon me, when you remember that your's would have saved my life."

These were the last words that ever passed between the two men. In another moment, the antechambers had poured out their armed inmates, and the din of contest and confusion echoed through the castle. Goyemon fought recklessly, his sole object being to purchase death from his adversaries, while they on their side were equally anxious to take him alive. It was a terrible and pity-stirring sight to see this solitary man, the arms of his outraged friend thrown about his knees like the iron band of fate, and a score of weapons forming an ever-narrowing circle of menace around him. Had he been free to move, the issue would have been speedy and certain, but held firmly in his place, the few vigorous blows his adversaries ventured near enough to receive, only served to place him beyond the reach of their swords. The result he had hoped to avert arrived. Half a dozen men advancing upon him simultaneously, caught his neck and shoulders with blunt halberds, or entangled long grapples in his clothes, so that dragged forward from above and held back below, after one supreme effort to close with his enemies, he fell heavily to the ground.

Meanwhile those least concerned in the capture, had exerted themselves most to spread the alarm, so that in a short time the noblemen in waiting, the captains of the gates and half the inmates of the castle, some bearing torches and others lanterns, hastened to the scene of disturbance. Taiko himself, though roused from sleep, did not leave his room, but summoning his body guards, took precautions against any sudden attack. Nobody supposed that the captured man was alone in his enterprise, and daybreak found the soldiers' scrutiny of the castle grounds still incomplete.

Goyemon, bound hand and foot and watched by twenty men, was confined in the muster-hall pending examination. The tabard and censor found in his bosom were carried to the Regent, who at once recognized the former to be the one given by himself to Hidetsugu.

It was almost impossible to suppose that the Minister could have quietly suffered the loss of such a rare and precious article, and yet under any hypothesis save that of theft, its possession by the captured man became the basis of strange and unwelcome suspicions. On the other hand, a burglar sufficiently skilful and daring to make his way into the Regent's sleeping room for the sake of a porcelain censor, would not certainly have been incapable of coveting Nobunaga's brocade tabard, and, after all, this man's action might be merely the outcome of an insane longing to get possession, one by one, of the most precious things in the empire. Hoping to be confirmed in this latter supposition, Taiko summoned his Council and demanded their opinions.

All, except Ishida Mitsunari, agreed that this robbery was probably one of a series, and that the tabard had apparently been the first to experience the fate so narrowly escaped by the censor.

Ishida, the subtle, scheming Ishida, made wise by the very considerations that rendered the Regent incredulous, gave it as his opinion, that Goyemon was the emissary of some powerful conspirator, who aimed at nothing less than the Regent's life.

Pressed by his colleagues to explain the grounds of this conviction, he said:—"Every theft aims either at its perpetrator's gain or its sufferer's loss. Now the Lapwing-censor is useless to any but its real owner. It could neither be concealed nor converted into money, if stolen, and therefore I conclude that its abstraction was dictated by the second motive I have mentioned. To understand that motive, it is only necessary to remember that the censor, though valueless to another, is inestimably valuable to the Regent, whose life it has twice saved. Suppose it were no longer by His Highness' side, what then? The robbery, accident has prevented to-night, would surely have been the prelude to an attempted assassination to-morrow. These are the inferences the censor suggests. I pass now to the tabard. It is at once too precious to have been easily stolen, too unique to be safely kept concealed, and of no possible service, as a tabard, to any but a nobleman of the highest rank. It did not therefore pass into this man's hands for its own sake, but was probably lent to him for some specific purpose, and that purpose is, I

believe, explained by the use to which the tabard was applied. Enveloped in its folds, the censor seems to have lost its miraculous properties, and suffered itself to be carried off in silence. It seems to me therefore, that the owner of the tabard is the conspirator under whose orders the captured man acted, and that, though the man himself had no immediate object but the removal of the censor, the ultimate design of the conspiracy was His Highness' death. Possibly," continued Ishida, now addressing Taiko himself, "your Highness finds it difficult to reconcile this theory with the fact, that the tabard so closely resembles the one given by you to the Prime Minister at the time of his investiture, but in the absence of evidence to the contrary, I think it only just to presume that some other nobleman possessed a similar piece of crimson brocade."

By mentioning the brocade and omitting the embroidery of the golden phoenix, Ishida tacitly indicated the impossibility of the presumption he advanced.

The counsellors kneeled with bowed heads, unable to contradict, unwilling to confirm. Some moments passed before Taiko mastered his emotion sufficiently to address them.

"My Lords," he said at last, "I commit the carriage of this affair to your discretion. Steps will of course be taken to ascertain whether Hidetsugu still possesses the tabard I gave him, but as for this thief, you will employ any means in your power to extort a confession of his real motive."

(To be continued in our next)

THE JAPANESE PRESS.

THERE SHOULD BE A LIMIT TO THE PRODUCTION OF SILK-WORMS' EGGS.

(From the 'Hochi Shimbun'.)

GOVERNMENT is responsible for giving protection to the people, and the people expect to receive it from the Government; but there is a limit to giving such protection, and if it should interfere with any small matters and go beyond proper limits, protection may result in harm. If, however, Government sees anything which may affect the interests of the country and deems interference necessary, it should act at once.

Silk-worm egg cards, a celebrated production of our country, used to be in former times produced only in certain fixed places, in Uyeda in Shinshu, and in Shimamura in Jôshiu; but since the Restoration, as, the foreign trade in them began to flourish, they having become an article of export, the silk business has extended into other places and the production of the silk-worm eggs has been conducted successfully. Several Companies have been established and managers and agents appointed, and in the 7th year of Meiji, an Association was established at Tokio, where all business connected therewith was conducted; and at the time when the cherry blossoms each year, the managers or their representatives, from all the silk provinces, assemble in Tokio and, selecting a president from amongst themselves, discuss the advantages and disadvantages &c. of the business, for a period of one or two weeks, and adopt then such methods as are decided by the majority of opinion of the members for the business transactions of the year. But no such assembly was, I hear, held last year; this however, we presume, was owing to the South Western complications. But I also hear that it will be held this year.*

But alas, as a few sheets of egg cards were exported at a high price in the beginning of this trade, producers, considering it to be their best business in future, increased in numbers, and produced greater quantities, year by year, which have become gradually inferior in quality, and thus have lost the confidence of foreigners, in consequence of which the price has gradually fallen down, and indeed during the last two or three years, even those of excellent quality have lost their normal value. And if the prices of best or first quality have fallen like this, the prices of second and third may be imagined, and although the middle class maintained their value for a little, the lowest class would not be even accepted, if given without payment. For eggs of such quality would, either exported

* We are informed that this committee will commence its session next week, and will publish the resolutions it arrives at for the coming campaign as soon as possible. [Ed. J.J.]

or employed in the country, result in harm to the silkworm-grower. They have finally had to be, by the decision of the members of the Silk Association, thrown into water or consumed by fire. This has been done now in successive years. But if we consider the object of the producers, it seems almost like that of speculators, who although they sustain loss for successive years, are not willing to give up the business at once. If they lose this year, they wish, indeed expect, to gain twice the amount of the loss next year, and so it goes on year after year, until they may finally find that they meet with the same fate each year, when they would despair and give up. But as these traders are generally men of this stamp, although the assembly may take place this year and all this be argued, it seems to me impossible that this practice would be resisted. Is not therefore a cry of the 'powerful old crane' (Government order) very necessary here now? Unless this is heard, silk, the most important of our productions, will, more or less, have to be destroyed, the labour of the product will be thrown into the bay of Yokohama and thus decrease a portion of our exports. I cannot but regret this for the sake of the country. I therefore heartily wish that producers of silk-worm's eggs should for the future be limited to a certain amount, or by averaging the actual amount that were exported during the past two or three years, settle a fixed amount to be produced next year, and thus regain what we have lost, and also make the silk business, which is the most important of our staple productions, more flourishing in future.

(To this article, a correspondent of the *Nichi Nichi Shimbun* replies as follows:—)

THERE SHOULD NOT BE A LIMIT PUT TO THE PRODUCTION OF SILKWORMS' EGGS.

THE argument to limit the production of silkworms is, I must say, simply for the purposes of profiting producers, and would cause more or less general loss to the country. The quality of the silkworms of our country differs in each province, arising from experience or inexperience, and skilfulness or unskilfulness of the producers. Thus, whatever limit may be put to the quality of production, unless the unskilful producer can be made skilful and the inexperienced made experienced, it is beyond hope that all the silkworms should be of equal quality. The limitation would, I think, tend to deter producers from competition in their work, and to make them work only as others do; because, if the system of limitation be actually carried out, it would follow that, although silkworms' eggs of the best quality would of course be sold at once, even those of bad quality would, although not admired, as there would be no better quality to be got, have to be bought by native and foreign merchants and thus the producers would gain their profit. Although, at first sight, the system of limiting the production may appear to be advantageous to all, and thus equally apportioning the profit, it only ends in giving a profit to a few producers and all the others throughout the country would have to sustain great loss, and finally the reputation of our product would be spoilt. It is a natural and acknowledged fact, that, in all things, if good seed is sown, the product will be proportionately good, but if bad seed is sown, the product will be proportionately bad. The silk manufacturing business in the various provinces is now daily increasing, the Kuwa (mulberry) gardens are being more and more extended and machinery, &c. is being provided. Would it not be a pity if there were now to be a scarcity of the best quality of the silkworms' eggs and thus make it impossible to produce silk of purely good quality? Unless therefore, in any year when we consider 1,000,000 cards of silkworms' eggs, a sufficient and suitable quantity for the use of the whole country, we produce 1,500,000 cards, and employ the best quality picked out from among them, we shall not be able to improve more and more the quality of the silk, which is the most important production of our country. The quality of the silk depends, upon not only the skill of the manufacturers, but upon the quality of the worms. For instance, there is, in my province, one Tanji Umekichi, who at the Exhibition in Austria received a medal of the first class for the silk he produced, as being the best in the world; and besides him, there are several more who produce a similar quality

of silk. This is simply the result of their skill and experience in feeding and rearing the worms. Thus the best plan, in order to make our silk known more and more widely over the world, to increase the demand and make our export trade flourishing, is to produce in large quantities, good and cheap eggs. This would then induce egg hatching to be studious in their work and to emulate each other in producing good eggs, and the silk makers to improve their manufacture and not fail in producing good silk. The silk eggs for exportation to foreign countries ought also not to be limited. If the system of limitation be adopted and 1,500,000 cards be manufactured in the whole country, of which 1,000,000 be taken for the requirements of the country, and the remainder be left for exportation; then if, at this time, foreigners should require to buy 1,000,000 at once, their value would no doubt greatly rise, in which case, our merchants, only seeking for the profits immediately before them, and not considering the requirements of the country, would export over the estimated quantity. This would be the course they would take and it would be impossible to resist it. Should this really happen, the silk manufacturers of our country, would sustain not a little injury therefrom, whereas, when it happens that the egg growers, after having grown a great quantity of silk eggs, unfortunately meet with the loss of throwing them into the water or fire, it is only a temporary injury, and if compared with limiting the manufacture, discouraging emulation in improvement and thus degrading the quality of our silkworm eggs and consequently spoiling the reputation of our silk,—which would be the more important? And again, is not this system of limitation far beyond the province of Governmental interference, and is it not rather near to oppression? I heartily hope that our Government will not agree to the request of such narrow-minded disputants who are in favour of the limiting system, or actually adopt it; for, although limiting the manufacture of the silk egg cards may show a little profit directly, as it would be greatly injurious to the country indirectly, the production should be allowed to go on freely, so as to maintain and advance the public profit in the future.

IS INTERNATIONAL LAW PRACTICABLE IN THIS SELFISH WORLD.

(From the 'Nichi Nichi Shimbun'.)

INTERNATIONAL Law is not Law: it is only improperly called so. Since Grotius formulated its general principles, nearly 250 years have elapsed; and during this period, the countries of Europe have not been destitute of eminent men, who have written upon the subject: but though, at present, we have the works of such eminent men as Wheaton, Kent, Watt, Phillimore, Mill, Bentham, &c. &c. in which are fully explained its principles, still we must say that it only exists in theory, and that we have not seen much of it practised. Though European Governments have, in order to further public interests and profit, despatched ambassadors to each other, and promoted such things as International Exhibitions, International Conferences on War, Telegraphs, Coinage, &c. so that meetings called 'international' are daily increasing in number—still International Law has not yet been looked upon as a law governing all countries, and though, sometimes, by means of a Court of Arbitration, disputes between nations have been adjusted; it is by no means as yet decided that Arbitration shall always be resorted to in cases of dispute. Why is this? Because "Law" is that which is established by authority, for the violation of which there are rules and means to punish. So long as they are not established by authority, and no means of punishment exists, international rules cannot be looked upon as really "laws." International Law is really in this condition, and as it has been formulated by no sufficient authority, appointed by the rulers of all countries, and as there is no Court before which violators of it can be summoned, nor any means of punishing them; obedience to international law is merely owing to the sense of right in nations, and not to legal compulsion. So if people have no regard for this sense of right, obedience to international law at once disappears, and it becomes merely a subject for argument among the learned. As is really the case at the present time. Although, in books bearing the

titles of treaties of International Law, rectitude and a sense of right are upheld as guiding principles, yet—looking at the actual state of Europe at present, what amount of these qualities do we see existing among them. Their condition, in fact, is the same as at the time of the war in Shinshiu (China) Leaving past time out of the question, we can prove this by examples at present. Napoleon III. when on the throne of France, in his transactions with other nations, deceived and hoodwinked them in various ways, and thus destroyed the sense of right in the minds of his own people: but at the same time the prosperity of France reached its highest point, and International Law did not censure the wrong doer. The next who usurped power over Europe was the German Minister Bismark, whose deception and dissimulation have not been less than that of the French Emperor; and Germany, too, in his time has been brought to the highest point of prosperity, and his proceedings have not been checked by International Law. And the proceedings of England towards Oriental countries, and of Russia in Central Asia have all been of a similar cast. A policy of deception produces prosperity, and the attainment of prosperity seems to bar International Law. It is therefore not too much to say that, in the actual state of affairs, the principles of International Law have no longer the slightest effect on the communities of the present day, whose friendly relations with each other are not governed by a sense of what is right and decent. Especially in the Turco-Russian War of last year—leaving aside the question whether the reasons of the Russians for fighting were sufficient or not, or in accordance with the principles of International Law—look at the policy of England. At first she showed great friendliness to Turkey, and incited her to fight; and then, as soon as the war began—putting her hands in her pockets, stood silently looking on, and would not come to the rescue, even when the Turks were defeated, and were about to surrender their capital. But when a Treaty of Peace was about to be made, she suddenly raised objections, and insisted that the terms should be submitted to a Conference of European nations, and also wants to interfere in the making of the Treaty, and is on the point of declaring war, if her demands are not complied with. Is this what International Law admits as right? England, evidently thinking this policy to be for the interests of the country, does not seem at all ashamed of it; and giving as her reason that there is a clause in the treaty between Russia and Turkey which affects her interests, refuses to agree to it. Austria, also, decidedly stating that the treaty proposed is against the interest of Austria and Hungary, says she cannot agree to it. Thus it would appear that decision to accept or not of a treaty is to be arrived at by seeing whether it is profitable or not. We must therefore conclude that England and Austria, transforming the maxim 'Necessity has no law' into 'When our interests are concerned, the question of right or wrong does not matter' make the latter their policy and wrest international law to obey it.

Therefore, in associating with other countries where decency and the sense of right are ignored, and only self-interest regarded, our country, too, should likewise keep its own profit in view, and should direct its policy towards such ends only as will serve its own interests. Thus, in the event of war between England and Russia, we should seize every opportunity of profit, and not perplex ourselves with the principles of International Law, so as to lose any gain that may be attainable.

Alas, that the world should be so selfish as not to be restrained by International Law!

YOKOHAMA JOCKEY CLUB.

SPRING MEETING, 1878.

THE FOLLOWING ARE THE ENTRIES.

FIRST DAY.—Wednesday 8th May.

1.—TRIAL PLATE.—For China Ponies that have never won a race. Weight for inches. Entrance \$5. One mile.

Vagabond, Vanguard, Velocity, Gone Away, Telephone, Brown Satin (late Mongolian Wolf) Sovereign, Brown Prince (late Satisfaction).

2.—GRIFFINS' PLATE.—Value \$200. For Japan Ponies, *bona fide* Griffins. Weight as per scale. Entrance \$10. First Pony to receive \$175; Second Pony, \$25. Five furlongs.

Vampire, Saint Elme, Kuazoku, Sir John, Admiral Rous, Petrel, Plover.

3.—.—For all Ponies. Weight as per scale. Entrance \$5. Three quarters of mile.

Valorous (late Mr. Toots), Grey Friar, The Dwarf, Liddesdale, Bonny Doon, Gone Away, Sunbeam, Skeddaddle, Chief Mongolian, Saltarello, Ballon Kiel (late Dick Swiveller) Oyama, Braemar, Lintie, Allendale, Dibs, Bravo, Chance.

4.—.—For China Ponies that have never won a race here up to date of entry. Weight for inches. Entrance \$5. Half a mile.

Velocity, Vanguard, Gone Away, Telephone, Saltarello, Sovereign, Allendale.

5.—.—For Japan Ponies. Weight as per scale. Entrance \$5. Half a mile.

Jim Hills (late The Convert), Fleur de Lys, Monarque, Saint Elme, Annandale, Kuazoku, Drift, King All Francis (late Exile), Oyama, Admiral Rous, Distemper, Petrel, Plover.

6.—.—For China Ponies. Weight for inches. Entrance \$5. One mile and a half.

Vandal, Vagabond, Valorous, Sunbeam, Bonny Doon, Mongolian Chief, Hah Daiku San (late Kingfisher), Braemar, Hoolet, Sport, Dibs.

7.—MITSU BISHI CHALLENGE CUP.—Value \$200. Presented by the Mitsu Bishi Company. For Japan Ponies. To be won at two consecutive meetings by the same stable, to be held in the mean time by the last owner. Weight as per scale. Entrance \$5. Once round and a distance. (Last winner Mr. Morrison's Distemper.)

Jim Hills, Fleur de Lys, Annandale, Kangaroo (late Kickapoo), Oyama, Distemper.

8.—.—For all Ponies. Weight as per scale. Entrance \$5. Once Round.

Valorous, Vandal, Grey Friar, The Dwarf, Liddesdale, Bonny Doon, Sunbeam, Chief Mongolian, Crusader, Kangaroo, Oyama, Lintie, Hoolet, Braemar, Dibs, Chance, Bravo.

8.—.—Open to Professional Riders. For Japan Ponies. Weight as per scale. Entrance \$5. One mile.

Jim Hills, Annandale, King All Francis, Kangaroo, Oyama, Admiral Rous.

SECOND DAY.—Thursday 9th May.

1.—.—For all Ponies. Weight as per scale. Winners of one Race at the Meeting 7-lbs. extra; of more than one race 10-lbs. extra. Entrance \$5. Once Round.

Valorous, Vanguard, Grey Friar, The Dwarf, Liddesdale, Bonny Doon, Sunbeam, Chief Mongolian, Kangaroo, Oyama, Lintie, Hoolet, Braemar, Allendale, Dibs, Chance, Bravo.

2.—THE MAIDEN STAKES.—For Japan Ponies that have never won a race. Weight as per scale. Entrance \$5. Half a mile.

Vampire, Saint Elme, Main Chance, Snake, Kuazoku, Sir John, Admiral Rous, Yama Sakura, Atsumidori, Petrel, Plover.

3.—.—For China Ponies. Winner of No. 6, First Day, 7-lbs. extra. Weight for inches. Entrance \$5. One mile and a quarter.

Vandal, Vanguard, The Dwarf, Bonny Doon, Sunbeam, Brown Satin, Chief Mongolian, Mongolian Chief, Brown Prince, Braemar, Hoolet, Dibs, Bravo, Favori.

4.—.—For all Ponies. Weight as per scale. Entrance \$5. Half a mile.

Grey Friar, Velocity, Saint Elme, Monarque, Liddesdale, Telephone, Gone Away, Sunbeam, Skeddaddle, Saltarello, Chief Mongolian, Kuazoku, Talisman, Ballon Kiel, Admiral Rous, Allendale, Lintie, Braemar, Bravo, Chance.

5.—.—For Japan Ponies. Winners of one race of three-quarters of a mile or under at this meeting, 7-lbs. extra, of two or more such races, 12-lbs. extra. Weight as per scale. Entrance \$5. Three-quarters of a mile.

Jim Hills, Fleur de Lys, Monarque, Annandale, Kuazoku, Kangaroo, Oyama, Distemper, Petrel, Plover.

6.—THE MITSU BISHI CHALLENGE CUP.—Presented. Value \$200. For China Ponies. To be won at two consecutive meetings by a Pony or Ponies, the *bona fide* property of the same owner or owners, to be held by the last winner at each meeting until finally won. Weight for inches. Entrance \$5. One mile and three-quarters. (Last winner Mr. Robertson's Dibs.)

Vandal, Valorous, Vagabond, Donca ter, Brown Satin, Mongolian Chief, Hah Daiku San, Brown Prince, Hoolet, Braemar, Sport, Dibs.

7.—.—For Japan Ponies. Weight as per scale. Winners of one race at this meeting, 7-lbs. extra, of two or more races, 10-lbs. extra. Entrance \$5. One mile.

Jim Hills, Vampire, Main Chance, Annandale, Sir John, Kangaroo, Oyama, Distemper.

8.—HACK STAKES.—For all Ponies not otherwise entered except for the Hurdle Race, and that have never won a flat race. Weight 12-stone. Entrance \$5. Three-quarters of a mile.

Jim Hills, Fleur de Lys, Monarque, Saint Elme, Main Chance, Annandale, Kuazoku, Drift, King All Francis, Kangaroo, Oyama, Distemper, Petrel, Plover.

9.—.—For Japan Ponies that have been beaten at this meeting. Weight as per scale. Entrance \$5. Five furlongs.

THIRD DAY.—Friday, 10th May.

1.—**THE HURDLE RACE.**—Value, \$75. For all Ponies, over six (6) hurdles. Weight as per scale, with an allowance of 5lbs. to Japan Ponies. Entrance \$5. Once round and a distance.

Vanguard, Borderer (late The Snark), Liddesdale, Gone Away, Annandale, Brown Prince, Favori, Gladiateur.

2.—**—For all Ponies Weight as per scale.** Entrance \$5. Three furlongs.

Grey Friar, Fleur de Lys, Doncaster, Saint Elmo, Monarque, Liddesdale, Telephone, Gone Away, Skeddaddle, Snark, Chief Mongolian, Saltarello, Talisman, Ballon Kiel, Admiral Rous, Allendale, Braemar, Chance, Bravo.

3.—**THE CHINA CHAMPION STAKES.**—For China Ponies. Compulsory on winners on 1st and 2nd days at this meeting. A Sweepstake of \$10, with \$5 extra for every Race won. Open also to Ponies placed second, at an entrance fee of \$5, to go to the Fund. Entries to be made on the Course at the close of the second day's racing. First Pony to receive 75 per cent., second Pony 25 per cent. Weight for inches. One mile and a quarter.

4.—**THE JAPAN CHAMPION STAKES.**—For Japan Ponies. Compulsory on winners on 1st and 2nd days at this meeting. A sweepstake of \$10, with \$5 extra for every Race won. Open also to Ponies placed second, at an entrance fee of \$5, to go to the Fund. Entries to be made on the Course at the close of the second day's racing. First Pony to receive 75 per cent., second Pony to receive 25 per cent. Weight as per scale. One mile.

5.—**THE CHINA CONSOLATION.**—For China Ponies beaten at this meeting. Weight for inches. Entrance \$5. Once round and a distance.

Vandal, Vagabond, Volorous, Velocity, Vanguard, Grey Friar, The Dwarf, Gone Away, Sunbeam, Bonny Doon, Telephone, Skeddaddle, Brown Satin, Mongolian Chief, Chief Mongolian, Sovereign, Crusader, Hah Daiku San, Brown Prince, Lintie, Allendale, Dibs, Favori, Sport.

6.—**THE JAPAN CONSOLATION.**—For Japan Ponies beaten at this meeting. Weight as per scale. Entrance \$5. Five furlongs.

Jim Hills, Fleur de Lys, Vampire, Monarque, Saint Elmo, Annandale, Main Chance, Snake, Kuazoku, Drift, Sir John, King all Francis, Kangaroo, Oyama, Admiral Rous, Distemper, Petrel, Plover.

7.—**THE CHINA HANDICAP.**—Open to Professional Riders. For China Ponies. Entrance \$5. Once round.

8.—**THE JAPAN HANDICAP.**—Open to Professional Riders. For Japan Ponies. Entrance \$5. Once round.

9.—**—For China Ponies. Open to Professional Riders. Weight for inches. Winners of one race at this meeting 7lbs., of two races, 10lbs., of more than 2 races, 14lbs. extra. Entrance \$5. Three-quarters of a mile.**

Grey Friar, Velocity, The Dwarf, Liddesdale, Telephone, Gone Away, Sunbeam, Bonny Doon, Skeddaddle, Chief Mongolian, Saltarello, Crusader, Hah Daiku San, Hoolet, Lintie, Allendale, Braemar, Dibs, Chance, Bravo.

EXTRATS.

THE BARBOUR CASE.
(From the 'Friend of India.')

IN dealing with this Barbour case, we now come to what is by far the most difficult part of it: that is the special liberties which these gentlemen allowed themselves, under the plea that they were justified either by the nature of their relations with Messrs. Williamson, or by the usages of Manchester trade. If we approach the dispute with a bias in favour of either party, such as Sir George Jessel seems to have been under in favour of the plaintiffs, it is easy enough to pronounce a strong opinion upon the matters in dispute; but it is certainly not so easy, when we make an effort to view them impartially from the stand-point which the two parties respectively occupy. Suppose we look in the first place at what seems to ourselves one of the most disagreeable features of Messrs. Barbour's conduct, namely, the discounting of Messrs. Williamson's bills. The charge against them under this head is two-fold. It is complained (1) that they discounted these bills at lower rates than they represented, and (2) that they omitted to give Messrs. Williamson credit for the proceeds of the bills from the real date of discount. As a rule, they held in their hands at all times bills remitted to them by Messrs. Williamson in advance of their wants, to be discounted as required for the payment of the goods bought by them on Messrs. Williamson's account. Now it is shewn in the evidence that they used these Bills freely for their own purposes, discounting them, or holding them over, according to their own forecast of the discount market. In other words, they assumed a right of holding the bills, not as Williamson's agents, but as bankers, and made the discounting of them a source of profit to themselves. Thus they held, say, in February, 1874, Williamson's bills of exchange, say, for £12,000, while they had no payment to make on their account until the 31st March. There was no necessity therefore for their discounting the bills until, say, the 30th March; but believing that the rates were likely to advance, they discounted them in February, say at 3½ per cent., as a speculation of their own. The market rose as they anticipated, and on the 30th March the discount rate is 4½ per cent., at which rate they credit Messrs. Williamson with the proceeds for the payments they have to make next day. Thus they assumed a

liberty, or right, of treating the bills of exchange as having been deposited with them as bankers. They did precisely what Glyn's or Smith Payne's would have assumed the right of doing, if Messrs. Williamson had sent the Bills to them to meet their liabilities to Barbour as they matured. The whole question, therefore, seems to turn upon the fact whether they were entitled so to regard themselves or not. Where remittances were in their hands, whether in the shape of bills of exchange or actual cash in advance of Messrs. Williamson's requirements, were they at liberty to deal with these advances as a banker would have dealt with them, and to make a profit out of them? Or were they bound to leave them untouched, until Messrs. Williamson's requirements necessitated their being used? The Judge does not hesitate to say that they were bound to leave them untouched; or, if they dealt with them at all, to do so on account of the Williamson's only, giving them the profit or charging them with the loss that had occurred on the use of them. It would be dishonest if, out of deference to popular impression, we were to say that the Judge was clearly right. It certainly bears a very nasty look, that Messrs. Barbour should use their financial skill to discount the bills before they are really wanted at 3½ per cent., and the charge Messrs. Williamson 4½ per cent.; and yet it is exactly what every banker would have done had Messrs. Williamson financed their purchases from Barbour through such an agency. Sir George Jessel insisted that the Barbours had no right to discount the Bills until they were actually required to meet Messrs. Williamson's purchases; and he would have insisted no doubt, that had the £12,000 been cash instead of Bills, they were bound not to use it in any way for their own purpose, but to have labelled it as Messrs. Williamson's, and left it intact. What Messrs. Barbour virtually said was, "if you send us remittances in advance of your liabilities, we shall regard ourselves as your bankers *ad hoc*, and make what profit out of them we can for ourselves, until they are absorbed by your requirements." And the sole question, as it seems to us, is whether in the absence of any specific agreement upon the point, they had the right to do so or not. What we cannot give in to—is the declaration that it was fraud to do so. In the absence of express instructions as to what they were to do with the advance remittances that reached them, they assumed a right of dealing with them as bankers *ad hoc* for Messrs. Williamson; and Sir George says that it was a "fraud" to do so. It is the fact, that we approached this part of the case with a strong impression that what Messrs. Barbour did was morally wrong, and that we should have to condemn it in severe terms; but the closer we have looked at it, the more indisposed are we to follow Sir George Jessel's leading on the point. To convict Messrs. Barbour of anything morally wrong in what they did, it seems to us that it would be necessary to shew, that they were bound by express instructions, either to hold these advance remittances as a mere trust in their hands, and not to touch them; or to make use of them to any advantage they could on Messrs. Williamson's account, charging a commission for what they did. In the absence of all instructions, it was fairly, we think, to be presumed by Messrs. Barbour, that they were at liberty to look upon themselves *ad hoc* as Williamson's bankers. If we are wrong, we should be most glad to see the right view of the matter set forth in our columns by some one else.

YOKOHAMA MARKET REPORT.

FRIDAY, APRIL 19th, 1878.

IMPORTS:—Business during the past few days has materially fallen off. Although native exchange is rather better, we have to report a decidedly weaker market. Heavy arrivals of goods, especially Yarns, are responsible for this. We hear that over 6,000 bales of yarn are in warehouse, sold to arrive, and about as much more unsold, with large quantities nearly due. We are not likely to see clearances of any importance until the arrival of new Tea and Silk, and as we are evidently to have a backward season, import merchants must be patient.

EXPORTS:—**SILK.** During the past week, very little business has been done in silk, owing, doubtless, in great measure to the difficulty experienced by buyers in selecting a parcel of fair quality from the very mixed lots which compose the small remaining stock. Much that we reported last week as having been taken into buyers' godowns has also been rejected, so that actual settlements for the fortnight amount only to about 150 bales. Some parcels, however, are still under treaty and before the present week closes, this figure may be somewhat increased. Prices are well maintained at our last quotations, and natives do not appear to care particularly whether they effect sales or not. Stock remains at our previously quoted figures, not exceeding 1,500 native bales.

EXCHANGE:—There is again very little business to report, and rates continue the same as last quoted, for Bank and Private paper on London.

On Hongkong and Shanghai, very few transactions have taken place, and rates on the former place have declined to ¼th @ ¼ per cent.

On New York and San Francisco, there is no business reported.

We quote:—London Bank, 6 months' sight 4s. 0d. Sixty day' sight, 3s. 11½d. sight 3s. 11d. @ 3s. 11d. Credits 6 months' sight 4s. 0½d. Documents, 6 months' sight 4s. 0½d. Documents continental, 4s. 0½d. Paris Bank, 6 months' sight 5.00. sight 4.90. Documents, 6 months' sight 5.06½. Shanghai Bank Bills, sight 73½. Private, 10 days' sight 73½. Hongkong Bank Bills, sight 1½ @ 1½ o/o disc. Private, 10 days' sight 2 o/o disc. San Francisco Bank sight 94½. New York Bank, sight 94½. **BULLION.** Gold Yen 392, Kinsatsu 426½.

* The dates of Arrival and Departure of the Mitsu Bishi Company's steamers are susceptible of alteration, consequent on the necessity imposed upon the Company—by its contract—of connecting with the steamers of the Pacific Mail.

** No days for Arrival or Departure of the Pacific Mail Company's or Occidental and Oriental Company's steamers having as yet been fixed, we are unable to tabulate them. Each separate steamer's departure from her port will be notified in the Table below, and the day of her probable arrival at her destination.

*** Three days are allowed in the P. & O. Company's Schedule for transit of the Mails between London and Brindisi.

*** Two days are allowed in the Messageries Company's Schedule for transit of the Mails between London and Marseilles.

SCHOOL FOR CHILDREN IN SWITZERLAND.

MADAME A. JAQUEMOT (née Dogny) proposes to establish at Geneva, Switzerland, a Boarding School for Girls, and for Boys under 12 years of age; where they will have the advantages of a sound education and sedulous domestic care.

Boys over 12 years of age may be committed to Madame Jaquemot's charge as boarders, and parents can thus secure for them the comforts of a home, with the opportunity of attending one or other of those educational establishments for which Geneva is so justly celebrated.

Parents wishful to place children under her charge at the Pension Dogny, may address their enquiries as to terms &c. to the Editor of the *Japan Times*, who is empowered to furnish them.

[\$24 PER ANNUM.

ARE OUR TELEGRAMS SAFE?

WE must call the serious attention of the Foreign Ministers and of the foreign commercial community to the following announcement, in which we describe a not inconsiderable danger, but one not at first sight apparent. On Monday evening last, in the advertising columns of our local daily contemporaries, appeared this Notification:—

IMPERIAL GOVERNMENT TELEGRAPHS.

The public is informed that the Government, having officially opened its Lines of Telegraph for International Correspondence, will no longer continue to receive at local rates Messages addressed to Nagasaki for re-transmission to Foreign Stations. Such messages must be addressed direct to their ultimate destination, and be paid for at the international rate, otherwise they may be refused or stopped.

In the event of any Telegram, the ultimate destination of which is beyond the Empire of Japan, being transmitted at the local telegram rates, the sender of the same will be liable for the full charge.

T. ISHIE,

Acting Director of Telegraphs.

Public Works Department,
Tokio, 22nd April, 1878.

When, at the end of last month, the announcement was made that the Japanese Government had concluded such arrangements with the Great Northern Telegraph Company as relegated it to its point of departure at Nagasaki, and gave to the native Department the care of all messages, international, or other, we congratulated the Government on having made a step in advance. A slight saving, too, was gained by foreign merchants, when sending only a short message abroad, in consequence of Japan adopting the one word system, and abolishing the \$2.515 fee for a message, as far as Nagasaki, of any length up to twenty words. But we never contemplated that Government would force us to use *only* their office here for the despatch of messages abroad, and deprive us of our right to have such started from Nagasaki, when we thought fit. This threat to 'refuse' or 'stop' messages sent to agents at Nagasaki for transmission by the Great Northern line implies a supervision over our telegraphic correspondence to which it is impossible for us to submit; which shakes our confidence in the Department's trustworthiness; and at once raises a suspicion of a most uncomfortable nature that some interested persons may be tampering with our telegrams and spying into our secrets. And the Agents of the Great Northern Company, moreover, have to account to the public for their own conduct in this matter; as it is evident that, without their connivance, the announcement would hardly have been made. For, unless they betray us, it will be impossible for messages sent to our agents at Nagasaki for transmission by the Great Northern Agent there, to be 'refused' or 'stopped' by the Japanese Government. It is to be hoped that these errors will be rectified; that this offensive Notification will be at once withdrawn, and that

the Agents of the Great Northern Company will immediately give to the public satisfactory assurance that our messages are safe in their hands.

At first sight, of course, the Notification would appear to indicate merely a 'squeeze,' especially of Baron Reuter. All Reuter's messages—we may tell the public—are 'packed'; it is by this process that he makes a profit on lines where the charge is for a given number of words or under. By the use of his directory of registered addresses, each compressed into a single word, his Agents are able to run together, without confusion, any number of different persons' messages, so as to fill up exactly the full number for any particular charge. And in this instance, Reuter's Agent here, by sending packed messages for abroad for transmission by his colleague in Nagasaki, and sending them as local messages at a charge of \$2.515, saves on each group of twenty words almost a dollar-and-a-half, inasmuch as twenty words for abroad, delivered in at the Government's office here, would cost him \$4.00. We fully anticipated trouble of some sort, when the charge of 20 cents a word was advertised as to come into force on and after the 1st of May. The proper charge would have been 12½ cents, or under, so that the charge for twenty words to Nagasaki for transmission abroad should not have amounted to more than for a local message of the same length. But we by no means anticipated, in addition to an enhanced charge, such an interference with our political and private affairs as this Notification amounts to.

Nothing of course is easier than for anyone, except Reuter's agent, to evade the Government trap, unless the Great Northern's agent at Nagasaki consents to become a Government spy, which we find difficult to believe. A man here has only to arrange with his Nagasaki agent that every word sent hence to him, for transmission abroad, is the code word above or below the real word to be sent on. Then, even if his cipher were guessed (and senders of messages would be astonished if they were told how much an intelligent telegrapher comes to guess, after a few months' working of a code) the sentence hence to Nagasaki would only translate into unintelligible gibberish; while if the Government at Nagasaki did get a copy of the real message sent on, it would not agree with the sham message sent hence. But why should we have to resort to any such subterfuge? The spot of ground on which is landed the shore end of the Great Northern Company's cable is a concession over which the Japanese Government have no jurisdiction—it is, or ought to be, neutral ground for all nations having Treaties with Japan—and with our messages sent thence through the submarine cable they have no concern. It should be sufficient for them that their own messages abroad are faithfully transmitted; they have no right or title to enquire whether a foreigner's message sent by the cable originates in Nagasaki or in Yokohama. Enough for

them that they have control over their own land lines: and it is natural and proper that the Government, whose property the land lines are, should claim and take precedence for their own messages over those of other people. Beyond this, all their customers, native and foreign, have a right to expect strict impartiality, and perfect secrecy. That messages should be submitted to censorship, to determine whether they are for delivery at Nagasaki, or for transmission thence to some other country, and subjected to refusal or delay at the caprice of a Japanese telegraph-clerk, is not to be borne. And it is clear that the system of differential charges cannot be worked without scrutiny. That the charges are differentiated is an error. As a matter of business, of cost of clerks' work, wear and tear of instruments &c., it is clearly the same thing to the Department, whether the twenty words sent to Nagasaki are to go on farther or not, and the charge for both classes of messages ought to be as far as possible assimilated. It is open to the Department to raise the tariff for local messages, if it thinks it would pay, to a point equalizing their cost with that of foreign-going messages at twenty cents a word: but we expect the Director knows better than to do this, and the only other alternative is to lower the tariff on foreign-bound words.

At such a crisis as this, especially, with war imminent between two great European powers, it behoves Japan to avoid the faintest breath of suspicion on her telegraphic system. An item of information might often, in times like these, be worth a frigate, and the suppression of a telegram *in transitu* might constitute a breach of neutrality. England has quite sufficient cause for dissatisfaction as it is; the Great Northern, though nominally Danish, is actually a Russian-owned line; and certainly either combatant would be apt to punish Japan most heavily, should any disaster occur to her ships or her commerce in these seas which could be traceable to Japanese connivance with foreign intrigue.

We have no doubt that these remarks will give offence to a number of individuals of whose very names we are in ignorance: but this is not a subject, nor is this a time, which will allow an English journal to give out an uncertain sound. We have full warrant for what we have written, and for more, if needful, and the interests or feelings of individuals do not weigh as a grain of dust in our balance, when in the other lies the welfare of our native land.

FORE-SHORE RECLAMATION. I.

IN our attempt to show the Japanese how some of their 'ruined rivers' may be restored, we have sketched the processes to be employed on the upper and middle sections of the streams under treatment; when we shall have given the same attention to the lower section, the 'mouth' of a river, our task will be done. But the same rule holds here as that mentioned when treating of rivers' middle sections:—each stream has its own peculiar surrounding circumstances, varying with various localities, to which must be adapted the processes in every separate case. And, as the river widens at its outlet, or divides into several branches as it meets the sea, so does our subject of riverine engineering develop, till it becomes foreshore reclamation, and modes of treatment rival in number the mouths of the Danube, the Mississippi, or the Nile.

If this were a Magazine instead of a weekly Review, and a number of pages, not lines, was our limit, we might attempt more: but, as it is, we shall confine ourselves to a single example of Japanese rivers. It is at once familiar and typical; for the Sumidagawa is not the only stream in Japan choked at its mouth by the accumulations of centuries of mismanagement, and creeping to the sea though acres upon acres of scarcely covered mud or sand which might, without much difficulty or expense, be converted

into useful land. Meandering through the vast flats which extend beyond the Forts and creep on along either side of the gulf of Yedo, as far as Yokohama on the one hand, and Saratoga Spit on the other, are the mouths of several rivers; but we only propose to deal now with the Sumidagawa, flowing through Tokio, and specially with that branch of it which discharges itself into the gulf to the right of the Light-house Fort.

Our readers will of course understand that we assume the upper and middle sections of the river to have been treated as recommended in our previous articles; that the accumulation of lithic matter has been checked, the flow of the stream facilitated, and that, nearing its outlet, it has thus acquired a certain volume and force. This has now to be utilized and increased. And now comes into play the valuable experience and appropriate apparatus of the Dutch engineer, for catching the soil and developing the channel. This successfully achieved, the reclamation of the whole foreshore becomes a simple matter, and the value of the ground reclaimed will more than repay the expenses of the whole operations; for not only will thousands of acres of valuable land be wrested from the sea, but the chosen channel will be rendered navigable, so that eventually Tokio might be made really a sea-port, and not remain dependant, as she is now, upon the anchorage of Shinagawa, an anchorage so exposed as for ever to preclude the profitable employment of ocean steamers, with so insecure a terminal point of their voyages.

We must again ask our readers to construct a diagram for themselves out of a familiar object. Let them take the skeleton of a flounder or other flat fish, and assume the head to be placed off Tskidji, and the tail to be in the vicinity of the present anchorage off Shinagawa. Considering the backbone to represent the channel of the Sumidagawa, which we propose to improve and prolong, and the side bones to represent the controlling apparatus to promote silt-catching, our rough diagram will be complete. But before using it in our description of proposed improvements, we must more minutely than we have hitherto done define a river's 'bar' and describe the process of its formation. This we cannot do in clearer or less technical language than that employed by the great authority Elisée Reclus, whom we have quoted once before. He writes:—

"At first sight, the origin of a bar seems a matter easily to be understood, especially in the case of rivers with waters much charged with mud. It is thought that the current of fresh water, being suddenly arrested in its career by the sea water, immediately lets drop on the bottom the matter which is held in suspension, and thus gradually forms the kind of sill which rises between the bed of the river and the ocean. This, however, is not the exact mode of formation. The flow of fresh water, being but little retarded, continues its movement above the salt water coming in a contrary direction. The sediment which is let fall by the current of the river is taken hold of by the counter-current and borne up stream. At the same time the heavier alluvium, which makes its way to the sea by gliding over the bottom of the river-bed, is arrested in its progress, and is mingled with the sand and the innumerable organic remains driven in by the waves. Thus an increasing cushion of mud is formed in front of the rising tide flowing to meet the river, and in this way the heaps of *débris* which constitute the bar are gradually accumulated. This obstacle being produced by the shock of two opposing currents, shifts coincidently with the scene of the conflict. During floods, the impetus of the mass of fresh water becomes sufficiently strong to remove the whole bar and to carry it further in advance; but on the other hand, when the water of the river is low, the tide resumes its preponderance, and the bar is again driven back. The barrier shifts its place, sometimes in one direction, sometimes in another, and is incessantly seeking to preserve its equilibrium between the two opposed forces which impel it."

From this quotation may be seen how vitally important is the work which has to be done on the upper and middle

sections of rivers, and how mistaken are engineers whom we have ridiculed for 'pottering about their mouths,' without attacking at their sources the evils which they seek to cure. It is evident that the prime necessity in working at the mouth of a river is that the stream should bring down a *minimum* of lithic deposit and a *maximum* of pure water, which should flow with such steady force (not rapidity, which in these instances, is a description of force not desirable) that in all ordinary weather the impetus of the fresh water should be sufficient to discharge the material forming the bar in sufficiently deep water that it shall not impede navigation. Along the backbone of our fish's skeleton, indicating the prolongation of the river's channel, which we propose to bring out into the bay, we have therefore to create, first, artificial banks, and this can be done by planting, at the junction of the fish's side-bones with the *vertebra*, and tapering off to right and left on the lines marked by the side-bones themselves, the *zinkstake*, *wieps* and *fascines*, the Dutch apparatus by means of which so much good land has been recovered from the stormy German Ocean by the persevering, industrious Netherlanders.

Of these combinations the 'fascine' is the unit. Our readers of course know that a fascine is a bundle of sticks;—in this case they are made of any tough brushwood procurable, and should be from eight to twelve feet long and about eight inches thick. The 'wiep' is simply a continuous fascine, a brushwood cable, and its length is determined by the object for which it is required. It is made rather thinner than the fascine—say about eighteen inches round, and is bound at shorter intervals. For binding, there is nothing better than the tendrils of the *fuyi* (Wisteria) or that excessively tough ground creeper so common about Kobe—there are some fine specimens in the Main Street. The 'Zinkstak' is a mattress made up of 'wieps' and 'fascines' arranged thus:—The brushwood is laid on trestles, compressed and bound, and turned out as 'fascine' or 'wiep' as required. 'Wieps' are laid in parallel rows, forming a grid, with bars two or three feet apart, and of the length of the intended 'Zinkstak' and across these bars are laid fascines close together. Across these again, parallel with the 'wieps,' are laid another layer of fascines, and again above these, a third layer, in the same direction at the first. Over all are laid 'wieps' carefully adjusted so as to be exactly over the grid of 'wieps' at the bottom. The fabric is laced firmly together, as it is built up, with vegetable binders or straw ropes, passed through the interstices and round the lower and upper layers of 'wieps.' The four edges are fenced with stakes and long sticks, and the whole apparatus is further strengthened by stakes driven through the mass at intervals from top to bottom. Should it be thought necessary, still greater firmness can be given by a cross layer of 'wieps' at top and bottom. Mooring props must be also provided, which depend for their character on the locality for which the 'Zinkstak' is destined, sometimes being collections of stout stakes or piles, ten or twelve together.

Thus is formed a brushwood raft, and when ready for launching, it should be from one-and-a-half to two feet thick. It can be rapidly made, and of any manageable size that may be desired, and of course wherever it is possible, it is constructed on a spot uncovered at ebb tide, so that the rising tide may float it, and it may then be easily moved to its destination. There it is sunk by means of stone ballast, the fascines, as laid in, having been partially weighted with heavy sandy soil, and the upper surface protected by tough clay well rammed in. The whole is then moored in position, and great care must be bestowed upon the selection of the site; for once down, it is a most difficult thing to raise. It soon becomes practically immovable. Storms, typhoons, currents, floods, fail to disintegrate it, and the sand and clay protect the more perish-

able vegetable parts from the attacks even of the dreaded *teredo navalis*.

Having thus prepared our apparatus, and sketched the outline of the plan on which it is to be used, we must leave until next week the description of the application of one to the other—and the result.

KOBE ECONOMISTS.

THE hitherto happy villagers of Kobe are affording the world another proof of the truth of the burden of an old song:—

'Tis better to leave the well alone.'

It cannot be that this community, so celebrated for its athletic triumphs, can be kicking against its Municipality, because it has so neglected its training as to have taken on flesh like Jeshurun;—for 'dull and depressed,' 'nothing doing,' and 'no transactions' have for months been stereotyped phrases in the circular of its Chamber of Commerce, as with ourselves. We are therefore thrown back on our childhood's friend and guide, Dr. Watts, for an explanation of its vagaries, and can only ascribe to Satanic influence the mischief wrought by a few idle malcontents. It is painful to see the only representative of the Fourth Estate, the *Hiogo News*, stumbling along in the van of the blind, and a second flash of light from the *Kobe Chronicle* seems needed to prevent them all falling together into the ditch of misrule. Failing this, perhaps a friendly warning from ourselves may not be unwelcomed.

Some three years ago, in the columns of the *Japan Mail*, Kobe was held up as an example, bright and shining with gas and cleanliness, to dark and dirty Yokohama. In the columns of this Review, too, have the excellence of its Municipal system and the consequent comfort of its citizens been cited for our imitation, and put Yokohama to shame. The happy harmony in which they lived together, the non-existence of 'cliques,' the efficiency of their police, the splendid discipline of their Fire-brigade, the beauty of their Recreation Ground and the conveniences of their Boathouse and bathing-place were themes of our untiring admiration; while a feeling of envy, almost amounting to hatred, was always excited by the calm, cool tone of superiority assumed by every stray denizen of the favoured Goshen who visited our benighted land, as he told us that, in Kobe—"there are no burglars, no fires, no beggars, no mud, and no dogs that bay the moon." A series of shocks of the rudest character has been given recently to our childlike faith in all these perfections of our sister port:—one correspondent of the *Hiogo News* calls for a chemist's aid to guard his slumbers from hawks that make night hideous; a thief in broad daylight walks off with property from the sacred chemist's shop itself; fires in rapid succession give pause to the Insurance Companies, who were on the point of reducing *premia* fifty per cent; and now seven sages come and take the roof off our faith in the perfection of the Kobe Municipal system, with their Land Renters' Committee Report. Happily they make such tremendous blunders in their statement of accounts, and commit themselves to such an utterly untenable proposal for the disposition of their savings out of the year's income,—to give it no harsher epithet—that we entertain strong hopes of their coming to their senses and withdrawing their Report, when their errors are mildly pointed out to them by ourselves, instead of incurring the harsher rebuke they ought to get from a bench of Consular magistrates.

It is necessary to quote in full their first paragraph, containing their statement of accounts. It reads as follows:—

"Having made a careful examination of the Municipal accounts for the past five years, your Committee find that

the total expenditure during that period, when arranged under the various heads, shews as follows:—

Superintendent's Salary.....	\$15,000.00
Police	18,825.32
Medical attendance for do.....	1,272.34
Lighting Settlement (part gas, part kerosine)...	11,458.14
Scavengers and watering	5,955.60
Municipal Buildings	21,547.52
Insurance on Municipal Hall.....	525.00
Roads and footways	8,457.60
Drains	5,044.86
Cost of lamp posts and lamps	3,061.64
Public Park and Bund Improvements.....	946.04
Recreation Ground.....	4,033.52
Ground Rents	3,634.19
Cost of Fire Wells, Bell Tower, &c.....	2,162.50
Expenses of Cemetery, less fees received	998.94
Sundries, including furniture for Municipal Buildings	4,007.53
	<u>\$106,930.74</u>

Now on the face of this statement is to be instantly descried its inaccuracy, and it should have been printed in red ink, as indicative of a blush. In the following paragraph we are told, and truly told, that the yearly revenue is about \$12,600; and how, in the name of Cocker and Colenso, do the seven wise men who append their names to the Report propose to make out that an expenditure of \$107,000 has been got out of an accrued income of \$63,000! That there is no misprint of 'five' for 'nine' is evident, for the superintendent's salary (\$3,000 per annum) is correctly stated to have cost \$15,000, and the police and lighting items seem also correct. We will charitably hope that it was not from eagerness to make out a case, but from ignorance of book-keeping, that the Land Renters' Committee have confounded capital with yearly expenditure. Because this is what they have done. Their items of \$21,500 for Municipal Buildings, of \$8,500 for Roads and footways, of \$5,000 for Drains, of \$3,000 for lamps and lamp posts, of \$2,000 for Firewells, Bell Tower, &c. of \$4,000 for the Recreation Ground and whatever may have been the cost of the Municipal and Police furniture,—which together make up a sum of \$44,000—ought all to have been excluded from their statement of 'five years' total expenditure. When the settlements of Osaka and Hiogo were first made, the upset price of the land sold was fixed at eight *bus* per *tsubo*, whereof six went to the Government, and two were "transferred to a Municipal fund to be formed at each settlement, and to be used for "the construction or repairs of roads and drains, lighting "the streets, or other Municipal purposes." (Land Regulations of Aug. 7th 1868.) Thus was formed the nucleus of the Kobe Municipal Fund. Moreover, by the same article of these Regulations, it was agreed that the Government should "consent to relinquish, for the uses of this "fund, a moiety of all money that may be realized at "the public sales of land at Osaka and Hiogo, over and "above the aforesaid upset price." As the land at Kobe sold for an amount largely above the upset price, the Municipality found itself started with a large fund, out of which the Municipal Hall, Jail, Police Barracks and Fire-Engine House were built, the roads made and footways paved, drains constructed, and, we think, the lamp posts bought. Still there remained a surplus, which has been since slightly increased by small balances of income over expenditure, and the Municipality has a 'reserve fund' of \$4,000 invested as a fixed deposit; but until a properly made-up capital account is presented to the public, we have a right to believe (and the writer is fairly well assured that the assumption is correct) that the cost of firewells and bell tower, and of the Recreation Ground, has also come out of this capital fund. Some slight deduction may be claimed on the items of Roads and Drains,—as we presume that the five years' repairs to these

are included in the Committee's figures, as also whatever has been spent in repairs on the Municipal Hall—these would all be properly chargeable to yearly expenditure account,—but if we allow \$10,000 for these, we shall still have \$34,000 as an error to score against the Committee.

Having thus formulated a charge of undue extravagance against the Municipal Councillors who have held the public purse for the last five years, and demonstrated, in this funny fashion, that out of a yearly income of \$12,600, they have in five years spent \$107,000, this Land-renters' Committee proceed to tell how they propose to not only make both ends meet, but to make them overlap, cut off a goodly remnant, and present it to the impecunious land-renters to put in their pockets. The owners of land in Kobe are mostly honest men, and we seriously doubt their acceptance of the gift. It is proposed to extinguish nearly half the lamps, impair the efficiency of the police, dock the Municipal Superintendent of two-fifths of his pay,—leaving him only \$150 per month,—and to abolish the annual fee of \$250 to the Medical officer. (Your Little Peddlington cheese-parers always cut down the doctor's pay: having no bowels themselves, they think that none of their servants can ever have a stomach-ache; besides, a doctor is a gentleman, and will feel too much contempt for them to complain.) These precious economies they justify thus. The gas-lamps, they say, are not required to light the streets for traffic, but are chiefly for the use of the police and prevention of burglary—which is perfectly true. But they argue that a ring of light round the outside of the place is quite enough for this, so they propose to extinguish 39 lamps within the settlement. They do not seem to see that burglars will thus have only to slip through the outer *cordon* of lamps,—where of course the beats of the policemen will be, to be of any use,—and they will then have the whole interior of the settlement as a happy hunting-ground. Arrangements should be made to direct some Ishikawa Goyemon of the neighbourhood to the houses and godowns of these seven economical accessories of his before the fact, that he may exhibit a little retributive robbery as a corrective to their folly.

The truly 'porochial' meanness of rewarding a faithful servant, who has worked very hard for a number of years to get the place into perfect order, by cutting down his pay nearly a-half, on the ground that he has left himself very little to do, is a good *pendant* to that of discharging the doctor; but it speaks for itself—it requires no comment. We pass to the ingenious way in which, having cut down Municipal expenditure, they would cut down Municipal income.

Article V. of the Land Regulations under which this Municipality exists provided that:—

"The Annual Rent of the said ground at Osaka and Hiogo shall be one *Bu* per *tsubo*, which shall be paid in advance into the Municipal Fund of each place, and shall be appropriated to the repairs of roads and drains, lighting the streets, or other Municipal purposes—subject however, to a first charge of one thousand five hundred and twenty four *Bu* at Osaka, and one thousand six hundred and forty one *Bu* at Hiogo, which sums shall be paid annually to the Japanese Government, as the ordinary land tax due on the said ground."

In addition, it was provided by another article, that in case it was required, a further sum, 'not exceeding one-third of a *bu* per *tsubo*' might be demanded of each land-renter. Availing himself of the fact that this latter tax was an elastic one, and being able to demonstrate that the Municipal service could be efficiently carried on,—police, lighting, and all, with the income from the land-tax alone, one of the elected members proposed, three years ago, to reduce the police-tax to the nominal impost of one *bu* per lot; and this proposition was carried. But there is no elasticity about the ground-rent mentioned in article V.

quoted above; whereas, having cut down their proposed expenditure, as detailed, to \$8,000 from \$12,600, these Kobe economists had to contrive some means of cribbing \$4,000 from their income. Our readers will hardly guess how they propose to achieve their object.

They propose to 'tamper with the currency'—to reduce the value of the *bu*. Disregarding the fact that both foreign and native Ministers agreed and mutually understood that a '*bu*,' for the purposes of this Convention, as for the customs, &c. &c. meant a silver *bu*, at three to the dollar,—they coolly propose to treat it as an abstract *bu*, at four to the paper *yen*. As payable according to treaty, they say, it is worth \$0.32.154—(these arithmeticians are as particular about their decimals as was Mr. Micawbor about his halfpence;) as payable according to them, it would only be worth twenty-two cents. And this neat little conversion, they point out, would reduce the Municipal revenue about \$4,000, and just balance accounts. As, however, it is at present only in the embryo form of a suggestion, we will neither christen it, nor attempt to father it upon anybody; enough to say that, if a man has to pay us sixpence and he attempts to palm off upon us a fourpenny-piece, we generally send for a policeman.

We need not go further into this precious 'Report,' though there are plenty of other fallacies and errors to expose. Such, for instance, as the argument, so clearly conceived by weak holders, that "a reduction of taxation" would increase the stability of the Municipal revenue, by "making lots more valuable, and tending to prevent their 'relinquishment.'" Should this foolish proposal be accepted, lots—on the other hand—will decline in value, for as, in another part of their Report, the writers propose an adjustment of the value of the *bu* annually, to suit each year's requirements, no buyer of land would know what ground-rent he might have to pay. And so on. But we have sufficiently criticised the document; it is a satisfaction to note that at its foot is not a single one of the names one is accustomed to see attached to public papers in Kobe, and though it is perfectly easy to believe that these agitators have a mob-majority at their backs,—majorities are always so stupid:—we have sufficient faith in the Consular Board and their present lay colleagues to believe, that they will treat as it deserves this petition or Report—should it ever be brought officially to their notice—by refusing to spoil the model settlement of Japan by false economy, and to descend to make paltry savings by meanness and chicanery—to satisfy either disgusted land-speculators or disappointed holders of kerosine lamps.

IN our last issue, we printed a couple of articles translated from the native press, on a subject which we discussed in the first number of this Review, a most interesting one to many of our mercantile readers—native and foreign—on the question: should, or should not, a limit be put to the production of silkworms' eggs. And in a foot note we mentioned that an assembly of representatives from the silk districts was immediately to meet in Tokio for the purpose of debating and deciding on the very important point—the number of egg cards which should be filled this year for home and foreign consumption. The *Hochi Shimbun* states in its issue of yesterday, that the members of this silkworms' eggs business Association met at their office in Tokio on the 22nd inst. and passed a resolution that the number of cards for the year should be limited to 130,000. But, the paper goes on to tell us:—'Tajima Yahei and ten others objected, and insisted that the production should not be limited at all. The Resolution, however, having been approved by a majority of the members, the President declared that, in accordance with Clause eight of the Regulations of the guild—(the *Hochi Shimbun* does not quote the section)—the Resolution must

be obeyed. Whereupon, those who objected to the limitation, still persisting in their opinion, refused to append their signatures to the necessary bond of agreement, and hurried off to the *Kuwan no kiyoku* (Board of Agriculture) to submit their views!' Here however, they appear to have got no comfort; for our correspondent goes on to tell us that, the decision having been legally arrived at, no one is of opinion that it will be overruled by Government.

Our foreign readers in the silk trade will not have failed to remark the characteristic shallow impertinence and superficial knowledge exhibited by a Japanese correspondent of another native paper, the *Chiugai Bukka Shimpō*, who wrote from Italy, and whose letter we translated into an editorial note last week. 'Silk-merchants and silk-growers in this country' he wrote 'are, contrary to my expectation, inexperienced in judging of the quality of the silk-worm eggs,' and went on to predict that as foreign buyers looked only at marks, cards with the Akita stamp would be the popular brand this season. In another part of his letter he makes the ridiculous statement that Akita cards were worth on the spot fifteen *lire* per card, others being worth but two to three.

The fact is that Italian silk-growers, and Italian *graineurs* who come to Japan, know precisely as much on the subject as Yokohama Japanese egg-sellers, and that amounts to—nothing at all. A hen-wife will know whether an egg will produce a bantam chick or a black Spaniard, if she knows from what cross was produced the egg; and, in the same way, the only person who can predict in the least how silk-eggs are likely to turn out is the person who saw the cards filled and knows from what moths the eggs were born. What the Japanese correspondent from Italy says is quite true, as far as relates to the ignorance of foreigners, but his implied assumption of superior knowledge on the part of his own countrymen is absurd.

PAPERS OF THE GERMAN ASIATIC SOCIETY.

THE GREAT EARTHQUAKE OF SHINSHU IN THE YEAR 1847.

THE province of Shinshu or Shinano is divided into ten districts, or *kori*, and is 547,300 *koku* in area, that is, it produces this quantity of rice annually. It is one of the largest of all the Japanese provinces, and is both mountainous and well watered. It does not touch the sea on any side, and it lies quite in the centre of the main island of the Empire. The people are intelligent, thrifty and diligent, and the province furnishes us with celebrated natural productions in great abundance. What unutterable woe came in former years over this richly endowed region! Thirty years since, a terrible earthquake changed blooming fields into a desert, and populous towns and thriving villages into smoking heaps of rubbish.

From the evening of the 24th of the 3rd month of the year 1847 violent earthquake shocks, such as had never occurred since the most ancient times, were felt in the province. For a whole week before the earthquake, the weather was incessantly bad and close. About 12 o'clock on the night of the 24th, when these shocks were occurring, there is said to have been a shower of stars, and many averred that they saw a white streak in the shape of a rainbow, stretching across the sky, in a North-westerly direction. At 4 o'clock on the morning of the 25th the mountains began to quake, and a hollow noise, which was particularly loud in the neighbourhood of the Senko temple, became audible. At the same moment, mountains fell in, and water overflowed the land. This all occurred before people had time to warn each other by the cry of "Earthquake!" Simultaneously, subterranean noises were heard. Cracks in the earth, varying from five inches in width to ten feet, were formed, from which masses of brown earth, frequently sparks of fire in large quantities, were ejected.

The fall of the mountain Kokusan or Iwakurayama was especially grand and terrible. It is situated near the village of Hirabayashi, in the Sarashina district, about three *ri* on

the west side of Obahayama. Falls occurred at two different places; and one of these was 30 *chô* in height and 20 in length.* The Saikama valley was filled with the *débris*. Large rocks rolled as far the village of Nubi in Nubi district, nearly a *ri* south of Magaribashi. The mass which fell from the Northern side of Kokusosan was fifteen *chô* high and twenty broad. The *débris* here completely buried the villages of Fujikura and Furagado. Owing to the filling up of the river bed with this *débris*, the water rose to a height of seventy or eighty feet, and inundated five or six villages, whereby innumerable human beings and cattle found a speedy and terrible death. On the north of Iwakurayama, a rock 60 feet in height fell down. In the lower part of the river, the water disappeared completely, and at the ferries of Nagai, Murayama, Tambashima, and Koichi, the boats were destroyed by the sudden and extraordinary diminution of the water. The inhabitants of the neighbouring villages were enabled to run from one bank to the other without wetting their feet.

Previously, the river flowed so swiftly in the neighbourhood of these ferries, that boats could not be ferried across with poles alone, hence a rope, carried from shore to shore, was always used for that purpose. At the time of the quaking, an individual crossing the river at the ferry of Koichi had arrived nearly in the middle of the stream when the hill began to move, the water rose high, and the rope was broken in an instant; even large boats were driven by the stream to a distance of a *ri*, and were carried almost up on the Sewaki hill. After a short time, the water disappeared very suddenly, and in the bed of the river an enormous cleft was formed, from which suddenly a hill was seen to arise. Many people and horses were swallowed in this cleft, but the boat which was on the rope escaped in a marvellous manner. The newly formed mountain, five *chô* in breadth, arose between Koichi and Komagunbara. It had to be removed afterwards, in order to prevent other inundations, and six thousand coolies were necessary for this purpose, and with the material of which it was formed, an embankment ten *chô* in length was constructed.

Other mountain slips occurred at Mushigurataki, chiefly on the south side, by means of which the villages of Yori, Fujisawa, and Tikobora were completely buried. The Todinigawa became choked, and both houses and fields were destroyed by the flood.

The sources of the Kagesusubanagawa were completely filled with earth, so that their waters could find no outlet. Fissures in the earth and landslips occurred chiefly in places situated on the north-west of the river. Liquid substance, earth, and flames were ejected from the fissures. In many places, depressions and elevations of the surface of the earth occurred, but these were so numerous that no account can be given of them here.

The formation of new hot springs, and the total disappearance of old ones during earthquakes, is remarkable; and it has also happened that the hot water of springs was changed into cold.

On the morning of the 28th the waters of the Sudzanagawa returned to their former course. At 12 o'clock on the 29th the shocks recommenced, again also with great destructiveness. This earthquake was particularly violent at Takata and Imamachi in Echizen, and the latter place was burned to the ground. Towards the end of the third month, the water at the Iwakura embankment rose about seven or eight feet, and in the beginning of the fourth month it rose three feet daily.

Shortly before 11 o'clock on the seventh day of the fourth month, a violent storm, accompanied by a heavy fall of hail, broke suddenly over the district,—the sky in the southwest, at the same time, looking black as ink. The rain became heavier and heavier during the night, and the following day Togakuchiyama looked as if it had been washed. From that time violent rainstorms occurred daily; the water increased with irresistible violence, and at the second embankment of Iwakura it rose nearly twenty feet. From ten a.m. to 2 p.m. on the 10th the storm was of tremendous force; torrents of rain fell, and the gale blew down large trees. The people were seized with unutterable terror; they feared that the Saikawa would overflow with more dreadful consequences than before. Every one seized

* A *chô* is about 1-15th of a statute mile (Branssen) so that two miles of the mountain side slipped down, for a distance of a mile and a third. Ed. J. T.

their goods, and fled to the more elevated parts of the district. This terrible storm seems to have spread over a large tract of country, as in the provinces of Mino and Owari, houses were blown down by the force of the gale.

The waters of the Saikawa remained for nearly twenty days spread over the land. All the villages on its banks were under water, and the inundation extended as far as Tikuma and Adzumi. An immense area of water, extending as far as the eye could reach, about eight or nine *ri* in length, flowed through the two districts of Minuchi and Sarachina, and spread as far as Ikuno, Hisaka, and Uraka. The tops of the hills appeared above the surface of the water like islands in the sea. On the 13th, after two hours of beautiful weather, frightful hollow noises were heard about six o'clock in the evening; earthquake shocks were felt at the same time. The first embankment at Iwakura burst; the mass of water rushed forward with immense force over hills and valleys; and the mighty roar was heard in distant places, such as Mazugiro, Susaka, and Nakano. "I, Shogen, was on the summit of Seidosan at Umizu (Haizu), when after a time I heard a rushing sound which continued for some time. It sounded as if it came from a place in the immediate neighbourhood. After a few moments, the water rushed to the westward, and the roaring of the waves was heard re-echoing among the hills. The foggy clouds, which hardly rose from the valleys were driven to the north and east. The storm carried sand and gravel away; and on me the raging struggle of the wild unfettered elements made the same impression as if myriads of wild horses were chased about on a large plain, and it seemed as if heaven and earth had collapsed."

After the bursting of the embankment the water at the foot of Magamiyama was over 61 feet. The frightful force with which the flood overcame every obstacle is beyond description. The main stream flowed towards the south, through Koichi, Kamagabana, Imasato and Imai; it flowed as far as Onbaigawa, and there united with the Zikuma-gawa. A second stream took its course through Shioku, Nakashima, Nanboku, Haramura, Ai, Komori and Yikuma-gawa. In the evening as the sun went down, the third main stream took its course through Kitakawabara, Mumesawa, Kakami, and Higana; destroying everything as it rolled on, it flowed to the south of Tanbashima, and then wasted Riyo-Ozuka and Kashima, and went as far as Yamatahara where it joined the others. The height of the water at Tikuma was now over twenty feet. At 10 o'clock in the evening, the stream had a breadth of six *ri* from east to west, and on the north side it extended to the main road into Echizen. At two o'clock on the morning of the 14th, the quantity of water had diminished considerably, and at sunrise it formed three large rivers. At four o'clock on the 14th the flood reached Niigata, and an area of fifty *ri* was inundated. At noon on the 17th, several thunder-claps were heard, and a furious storm, which destroyed many houses, broke out at the same moment. In the Saku district in Koshu much damage was occasioned by a violent hail-storm.

On the 28th the sun was of the colour of the *Beni* (saffron plant), and lost its glittering light. On the 20th of the 6th month, claps of thunder were heard here and there; many houses were thrown down, and both men and horses lost their lives. During the first three days of the seventh month the earth shook day and night; and at four o'clock on the morning of the 19th these shocks recommenced, so that the terrified inhabitants left their houses and lived in the open air at the same time, the waters of the Sushanagawa, Sitogawa, &c., overflowed their banks, and ravaged the country as far as Tenkôji, carrying away many houses. On the 20th of the 8th month the Kayagawa returned to its old bed. At the end of the tenth month, the shakings and subterranean noises were often heard.

EDITORIAL NOTES.

THE Japanese Government can again point to that of England as giving it a precedent for controlling the native Press. More than once lately have English statesmen had to suspend Irish newspapers which were preaching sedition, and we now find the Government of India putting a curb on the vernacular Press of India. The

Bombay Gazette, a Liberal paper of the highest class, thus records the circumstance in its issue of March 18th:—

"The principal event of the week has been the sudden passing by the Government of India of a Bill establishing a severe censorship over the vernacular press of India. The reason alleged for the introduction of the Bill is that the vernacular press is distinctly disloyal and is addicted to making unfavourable comparisons between the power of England and Russia. The policy of introducing such a Bill at the present moment cannot but be condemned as it exaggerates the importance of the vernacular press and the influence of Russia in Indian affairs."

"We understand that the Secretary of State has by telegraph approved of the general scope of the Vernacular Press Bill and of its being introduced and passed through the Legislative Council. This seems to show that for political reasons the passing of the Bill has been suggested by the English Government."

We cannot agree with our Indian contemporary in condemning the action of Government. The half-educated classes in India who read the vernacular papers have the same influence over the wholly uneducated classes, who cannot read at all, as is the case here, and are just as excitable, superstitious, and easily led by designing men. It will be long ere either India or Japan is fitted to receive and utilize the not wholly unmixed blessing of a free Press.

THE name of Baboo Keshub Chunder Sen will recall to our readers' memory the visit to England, years ago, of this distinguished Hindoo scholar and theologian who, as a sort of Indian Protestant and Reformer, was received by the religious world of England with the honours due to a Luther. His portrait was given in a full page engraving in the *Graphic* and *Illustrated News* and his lectures were listened to with enthusiastic admiration by full audiences at Exeter Hall, St. James' Hall and elsewhere. Specially did he take up his parable about the education of women in India, the abolition of polygamy, and the enervating practice of early marriages. The wily Baboo has just married his daughter to the Maharajah of Cooch Behar, to the frenzied indignation of the Bramo-somaj party—that of Young India—whose apostle and Gamaliel the old gentleman has hitherto been. The boy and girl are both very young, the Maharajah may take as many wives as he likes, and the only consolation remaining to the reforming party is that no idolatrous rites took place at the marriage ceremony. The Maharajah's numerous mammas, on the other hand, are tearing their hair because the idolatrous rites were not performed, that nothing of the ceremony was Indian except the paltry feeding of 5,000 beggars, that the daughter of such an infidel as Chunder Sen should enter his harem at all; and also that the British Government proposes to send the young gentleman to England to be educated. As the people of his State also object to his going, and as he certainly won't be allowed to take his bride to school with him, the prospects of the Maharajah of Cooch Behar's enjoying a peaceful honeymoon are dubious.

FROM our Hongkong exchanges, we learn that the Hon. J. Gardiner Austin, the Colonial Secretary, has taken his final departure for Europe from Hongkong. The name of this venerable public servant has been long before the public of the Far East, and a few of the older residents of Yokohama will remember his son, who was for some time in the house of Jardine, Matheson & Co. and for a few months represented it here, and whose untimely death cut short a promising career. The Colonial List tells us that Mr. Austin filled various appointments, as Magistrate, assistant Government Secretary and immigration agent in British Guiana from 1849 to 1864, when he was appointed lieutenant-governor of Honduras. In 1868 he was made Colonial Secretary at Hongkong, which post he has since filled with credit.

THE Hongkong papers are much exercised by the promotion of Mr. J. M. Price, the present Surveyor General, to fill Mr. Austin's place, temporarily, as Acting Colonial Secretary,—over the heads of others with ostensibly stronger claims, notably Mr. Cecil Smith. Considering that the appointment is only an 'acting' one, for a few weeks or months, until Mr. Austin's successor is appointed by the Colonial office and that Mr. Cecil's Smith's relations with

the Governor are anything but amicable, we should imagine that this latter gentlemen feels less aggrieved by Mr. Price being preferred to himself than his friends in the Hongkong Press.

DURING the short holiday vouchsafed to us at Easter, the opportunity was taken by a correspondent, of inspecting the salmon breeding establishment opened by the *Gaimusho* at Tana, on the banks of the Sagami river, and he has been good enough to place his notes at our disposal for record. The buildings erected for the purpose, it appears, are of the simplest character, consisting of a shed to cover the hatching troughs, and a house—we might rather say a hut—for the keepers. The water is supplied through bamboo ducts from a hill-side rill, and after serving the troughs, is discharged into the rearing tank, adjoining the hatching house. The ova are procured from the Kanagawa river in Mito. As this is the first year of the experiment, it is too soon yet to speak of the results thereof, or of the chances of success. We can only state what has been done. Some 50,000 fry have been already placed in the pools of the river, and a corresponding number are now in the rearing tank, shortly to be turned out, as soon as they are big enough to take care of themselves. Every care seems to be bestowed on the fry, even to the doctoring of the sick and ailing, and nearly all of them were, at the time of the visit, in thriving condition. The Government, too, has not been unmindful of the protection of the young ones after they have left the tanks, and have been turned into the pools. All fishing in the river has been stopped for two months. So far, so good. But to complete the success of the scheme, they must go further, and issue Regulations prohibiting the use of nets with a smaller mesh than—say four inches, the taking of unclean fish and the taking of salmon under a certain weight. It would be beneficial, too, if certain lengths of the river were set apart, in which fishing, and that with the rod and line only, could alone be had under the license of the government. Such a scheme would soon result in the stocking of the river with well sized fish, while the fees charged for license to fish in the preserved waters would, in a great measure, recoup the Government for its expenditure. On the other hand, if some restrictions are not placed on the use of the seine,—or of the cast-net, with its very destructive small mesh, which is now in vogue among Japanese fishermen, the Government can hope to do little more than, out of a year-by-year importation, obtain at great cost a supply of a few under-sized, unseasoned fish. Interference by restrictions like these, to check the improvidence of the individual, for the ultimate benefit of the community, is one of the legitimate acts of a Government often necessitated by the ignorance, selfishness, or recklessness of the subject.

The Sagami River is well adapted to the culture of the salmon, or its congener, the trout, which already flourishes in the upper waters, and under proper regulation, the fishery should become a source of wealth to the district fishermen, and a means of recreation for the angler. We shall watch the progress of the scheme with great interest for the sake of all concerned; and our interest would be greatly increased, if the salmon of Mito were susceptible to the blandishments of the fly; it remains for us to hope that a change of scene and *habitat* may have changed their nature.

WITH Bank holidays at the beginning of the week and Athletic sports half-holidays at the other, both import and export markets have seen but little business. Exchange has remained in *statu quo* and for the few alterations in prices which we have to note in our goods market, we refer our readers to our page of Quotations without further remark.

NOTES AND QUERIES.

QUERIES.

Qy. 6. Can any of your readers inform me whether there are any, and if so, what books on Japanese surgery, or midwifery, as practised before the coming of the Dutch and Portuguese? (Unanswered.) Z.

Qy. 8. Mr. Bramsen's interesting note on the relative values of coins in your issue of February 23th, leads me to

think that he or some one else may possibly be good enough to clear up a few points which have frequently occurred to me:—

1.—Can any one say when, and under what circumstances, paper money was first issued in Japan? "Shosai" in your issue of March 9th gave a most interesting account of the *Han* paper money; and perhaps if there were a general issue before that, some other student may be able to do the same for it.

3.—Can any account be got of the regulations (if any) which governed coining under the feudal system? For instance, under what circumstances was permission granted to certain individuals to strike coins? This seems to have been done at various parts of the country, thus we have Musashi Ichibu, Suruga Koban, &c.

(Unanswered.)

X.

Qr. 9. I want information as to the locality of the signature of the original Treaty with Japan by Commodore Perry. Treaty Point, a mile or so away from the town indicates the spot: but was the treaty signed there in the Temple at Homoko, near which the butcheries now stand; or was it under a group of trees which stood on the site of the present British Consulate? I have heard both places assigned as the scene of the transaction.

(Unanswered.)

B. A.

Qy. 10. Can any of your medical or other readers inform me of the recent existence of cases of poisoning resulting from the use of bread made from impure wheat; the symptoms being those described in works on Medical Jurisprudence, as arising from the presence of the *Lolium temulentum* or Darnel grass (or other poisonous *gramineae*) viz; Gastro intestinal derangement, narcotism, vertigo and convulsions.

(Unanswered.)

R. N.

Qy. 11. Many of your readers, when walking towards the new cemetery, must have remarked the *tumuli*, about twelve in number, which dot the table land which lies above Ota on the one side, and the hill of Tobe on the other. These *tumuli* are religiously preserved from the spoiling of the farmer, and must have some history; are they the burying-places of heroes fallen in some old quarrel? Can any of your readers enlighten me?

(First time of asking.)

YOKOHAMA: SATURDAY, APRIL 27, 1878.

NOTES OF THE WEEK.

FRIDAY EVENING, April 26th.

THE *City of Peking* from San Francisco arrived on Tuesday last, having left port on the 1st instant. The *Volga* bringing the Marseilles mail of the 10th of March anchored in the harbour at 5.30 p.m. yesterday. The *Malacca* with the London mail of the 15th of March left Hongkong on the 23rd inst., two days behind schedule time. The *Tanais* leaves on the 1st proximo with the French mail due in London June 20th and the *Chion* is advertised to sail for San Francisco on the 4th proximo. The *Nagasaki Maru* leaves on May 1st for Shanghai and ports. An onward and inward Shanghai and coast ports steamer completes our mail steamer intelligence for the past week.

The opening of a new Tea season is signified by the arrival of the flight of Tea-tasters who arrived by the *City of Peking* from America on the 23rd inst. From a glance at her long passenger

list, one is led to believe that the party she brings must have spent three very enjoyable weeks. There is a great deal of fun to be got out of a voyage like this, in a good ship, with a pleasant captain and a party of passengers the majority of which are well acquainted with each other. Private theatricals, concerts, readings or lectures, sometimes a little magazine, may be got up—according to the tastes and idiosyncrasies of the leading spirits among them. The writer has lively and most agreeable reminiscences of several such voyages. On one he learnt piquet, and fancy what a solace that will be to his declining years! On another, he enjoyed one of the most agreeable and successful amateur concerts ever arranged, there being luckily on board four or five passengers with such voices as are seldom heard off the Italian stage. A third was made in company with a great actor, who graciously entertained his fellow-passengers one evening with readings from Shakespeare. Epigrams, on another, were the order of the day. An example from our common-place book may not be unwelcome. It was written on the subject of the Doctor, who, we had ascertained, got a very poor salary from the Company, but made a decent livelihood by embalming defunct passengers. He used to complain bitterly that the Company, since an economical Direction had come into power, had docked him of half his fees and made him find his own Carbolic Acid:—

"IN MUMMIFECEM."

"Our Doctor's so clever—don't let it alarm us,
If he cannot preserve us, he'll nicely embalm us;
He eats a good breakfast—then stuffs a Chinese,
Before dinner a second, and one after tea,
A fourth for his supper; then, perfectly placid,
Goes to bed with a tumbler of carbolic acid,
Perhaps two or three—and then after his toddies
Dreams sweetly of fees upon pickled deal bodies."

We were delighted to welcome back to Yokohama, ex *City of Peking*, our deservedly popular American Consul, General Van Buren. His occupation of a berth in the ship is a thoroughly good guarantee, alone, that her passengers must have had as pleasant a trip as any of those to which we have referred above. Now that he has re-assumed the curule chair, we shall look to him to help us to crawl out of our Municipal slough.

Apropos, we beg to put a case to the Consular Board. In the middle of the foot path in the Main Street, just opposite the Roman Catholic Church, are a couple of heavy wooden iron-bound flaps, about two feet square, which cover the openings through which access is had to the fire-wells. During the past week, on three occasions, the writer has passed these late at night and found them half-opened, thus making a most dangerous obstruction on a moonless night. Nothing but the extreme wariness which grows out of the necessity of traversing our unlighted streets when most other people are snug in bed (and the old-fogey habit of carrying a 'chocking') saved him from breaking a leg. In case of such an accident, who could be proceeded against for damages,—the Fire Brigades, the Roman Catholic priests, or the Japanese Government?

Mr. Wilkinson has inaugurated his reign as acting Consul by an extremely cunning use of the 'iron hand in the velvet glove.' In common, apparently, with three folio chit-book pages' full of brother culprits, the writer had been hugging himself for the last six weeks in the belief that surely, in his insignificance, he at least had escaped the modern Poll-Tax gatherer's eagle eye for this year, and had resolved most gratefully to devote the 'sov' towards swelling Mr. Forsyth's retaining fee, whenever China and Japan mercur hants should wake up their minds to resist this infringement on the Bill of Rights. But, yesterday afternoon, presto! himself an apparitor, A.H.M.S., and a cold perspiration bedews the face as the envelope is broken open! The feeling of relief excited by finding,—instead of a summons and a threatened fine,—a neatly printed form, with a polite request for a few lines of manuscript in the blank spaces and a trifle of five dollars; the feeling of relief is so intense that the blanks are filled up without thinking and the poll-tax tooth extracted for once, without a pang! Permission to be a British subject for another year avorns our ———— to R.I.B. Britannia,—Britannia rules the waves;—Britons never, never, never will be slaves!!

Great excitement has been caused this week by the movements of the English and Russian squadrons. Ruler's Lytlebank on Sunday the 15th had gone out of the harbour. About half-past two in the afternoon the *Delphin* sailed under the *Maggie*, followed; and the *Albatross* sailed. The entrance to the harbour till the *Delphin* was out, was guarded and he intended to convey her to the entrance of the strait, still the Russians have received news of a fleet of gun-boats of which we were ignorant. Our leading anti-fleet ship shot that this is a contingency not altogether out of the realm of possibility.

The wireless telegraph, long a phantasm communication with Shanghai has been restored but the telegrams are not very satis-

factory. For instance, Baron Reuter must have sent the following messages, which we got on Thursday last, for merely perfunctory reasons, in fulfilment of his contracts:—

"London, April 23rd, 1878.—The warlike situation remains unimproved. Austria is vacillating over what action she shall adopt, and there is an essential difference in the views of Russia and England."

He might have as well telegraphed a verse from *Alice in Wonderland* of 'Tweedle dum and Tweedle dee, prepared to have a battle.' What we want from the Baron are 'facts,'—we can form our own opinions, and draw our deductions, for ourselves.

During the week there have been some land sales, the prices realized, we are sorry to note, giving a poor look-out for land-holders. One lot, decidedly one of the most beautifully situated on either Bluff, known as 'Paradise,' prettily wooded and commanding three exquisite land or sea-scapes, sold for only \$900. Last week, for \$1,200, another purchaser got a lot, with a pretty little villa upon it, which must have cost at least three times the money to build. The crushing ground-rent exacted by the native Government really constitutes a quite legitimate grievance, and we trust that, in the give-and-take Revision of the Treaties now under consideration, our Representatives will obtain some reduction thereof, in exchange for some one or other of the numerous concessions asked for by the Japanese. The exaction of such rents militates strongly against investment of foreign capital, and the consequent creation of a class of resident foreigners interested in the stability of the Government and the prosperity of the country. It is odd that in a country like this, so poor in accumulated wealth, the Government should not be able to see the benefits which would accrue from attracting, instead of repelling, foreign money.

The *Chihokuwan Kuwaigi*, (Assembly of Provincial Governors) was debating during last week, first on a new subdivision of the country into districts, villages and streets, as in ancient times, the larger divisions of *Ken* and *Fu* being retained as at present. This was a short bill and soon passed. The next subject was one of greater importance and has occupied the Assembly several days. It is nothing less than a proposal to establish municipal Government with a representative system, a fairly conservative franchise, with a property qualification, proportional representation and vote by ballot. The whole system is at present vitiated by the Municipalities being only allowed to discuss such matters as the Provincial Governors place before them, and also by the power vested in the same officers of closing the debate whenever anything is said, which they deem seditious. But in this column we must not anticipate what we shall probably have to say in our leading columns, when the Bill shall have been completed and passed.

Some excitement has been caused in the capital by the arrest of several prominent Tosa men, amongst them Oyo Taku, late Gonrei (deputy-Governor) of this *Ken*. Our readers will remember that, at the time of the Satsuma rising, great fears were entertained lest Tosa should also rebel: but clan jealousy kept the province quiet except from talking. Now, when any attempt against the Government would be hopeless, we hear of arms having been secretly collected, and other symptoms of a conspiracy being detected, of which these recent arrests are the consequence. There does not seem to be the least cause for alarm.

We hear that it is proposed to hold a Regatta on the 24th of May, in honour of Her Majesty's birthday, and under the auspices of the Bowing Club. There are to be, if sufficient entries can be obtained, yacht racing, races for open sailing boats, and events in which the men-of-war and merchantmen can compete, in addition to the races among the members of the Y.A.R.C. These events, if the entry-papers are well filled, should afford a good day's sport, and it only remains to pray for 'Queen's weather' for their decision. Of course, the funds of the Y.A.R.C. are not in a position to justify that association defraying the whole cost of the Regatta, if attractive prizes are to be given, as well as the expenses of entertaining our guests, and we presume an appeal will be made to the community for assistance. It will certainly be generously responded to, as soon as the Y.A.R.C. shows us more than one four-oar occasionally out for practice in the bay. When the programme is published, we will give fuller notice to the subject; meanwhile we wish the Y.A.R.C. good weather and a successful meeting.

The Athletic Club were favoured, for their first day's meeting to-day, with weather almost as fair as the ladies who graced the stand. The tender green of Spring, clothing the surrounding hills with varying verdure, wherever the eye rested, shaded here and there by sombre evergreens, or lighted by the delicate blossom of the cherry or the plum; the waving plumes of the graceful bamboo, with here and there a speck of brilliant maple, together made a background for the bed of flowers which seemed to fill the Grand Stand, and the whole made a picture which a spectator will not easily forget. It was to be regretted that we had not, as on other

occasions, the stirring strains of a band, to please another sense; but the low ripple of laughter and the hum of conversation filled the intervals between the several contests as pleasantly as music.

The sport was inaugurated, punctually at 2 p.m., the time appointed, by the preliminary heats of the 'sprint' races: and an attempt to hit a wicket with a cricket ball was made without success by some eight or nine would-be cricketers and others. We would suggest to the Committee of the Athletic Club, that this should be admitted as a feature of their programme for the Autumn Meeting only, after some practice can have been had with the ball. Also we would recommend that bad cricket should not be encouraged, by giving a prize for a full-pitched throw, instead of for the delivery of the ball, as it should be sent in, with a single bound, as if into a wicket-keeper's hands. The judgment for this event should go by 'points,' given in accordance with this principle. For the long throw with the cricket-ball, we were glad to see the winner turn up in a member of the Fourth Estate—Mr. Clode, of the *Japan Gazette*. He made a moderate, but straight throw of 75 yards.

The real business of the day began with the race for the Champion Cup (quarter-mile). We had to deplore the absence of Mr. Watson, the winner at two previous meetings and of Mr. Walker, his antagonist at the last, both of whom had broken down in training. In their absence, only two started, and the prize fell to Mr. A. H. Dare, the brother of the donor: he was never approached, and won in the slow time of 60 sec. The boy's race (1st heat) then afforded much amusement, while six competitors were preparing for the race of the day—the Ladies' Purse (660 yards). In this race, previous winners are heavily penalized, with the express object of excluding them from all chance of success, and 60 yards is handicapping enough to stop the best of men if he meets competitors worth beating. For a quarter of a mile there was a good race between Vincent and Playfair, but after that, the latter gave in, leaving the former to come in an easy winner by twenty yards. A. H. Dare struggled hard under the disadvantage of the long start he had to give the winner, but though going strong all the way, he lacks the turn of speed necessary to make up for such a crushing penalty. Miss Brooke presented the Purse to the winner, and in a few gracefully spoken and appropriate words, congratulated him on his success. Mr. Kilby, the Secretary of the A.A.C., then presented her with a bouquet, on behalf of the competitors. The quarter-mile handicap produced an excellent race, won by Mr. Poulter, R. N. in 57 seconds: Walker, from scratch, struggled gamely, in spite of his lack of condition, but could only get up third. The winner was greeted in a most enthusiastic way by cheers from the sailors on the ground. The Mile Walking Race gave us the only really closely contested race of the day. Clode, the limit man, made but slight use of his start, and at the top of the back stretch in the first lap was caught by Ward; the two raced together from this point, toe and toe, until the completion of the third lap, when Clode spurted, and left his man about ten yards; Lingham, R.N. had meanwhile closed up with the leading pair; up the back stretch the relative positions were maintained, but going round the turn at the top, both second and third closed in on the leader, and the three entered the straight for home dead level. The pace now became very fast, too fast for Clode, who gave in—quite walked out—about fifty yards from home, leaving Mr. Lingham to win a very fast race in 9 min. 3 sec., very well-deserved and vociferous cheers greeting his victory. A Tug of War between the 'Salts' and a shore team, however, turned the tables on the sons of Neptune, who were defeated in the easiest possible manner; the civilians weighing an average, however, of some twelve stone, we should say, to the Sailor's ten, did not boast of much of a triumph. Tomorrow will be run off the deciding heats of the sprint races, and the half-mile; which, with the steeple-chase, and other events will give us another capital afternoon's sport.

By the way, would our readers like to have acrostics? They appear to titillate the brains of a good many Yokohama residents on Sunday afternoon in an agreeable manner, and as they seem to be quite the fashion in the London weekly papers, we have no objection to set aside a corner of the *Japan Times* where such rubbish may be shot, albeit at a certain small sacrifice of the dignity of 'this Review.' Our subscribers have only to ask and have: they are easily made. Meanwhile, as a puzzle of rather severer nature, here is a *menu* in Latin, which we came across to-day in turning out an old box of odds and ends. The dinner was given by an eminent London surgeon of our acquaintance, on the occasion of a number of old fellow-pupils coming up from the country to attend a medical congress of some sort or other; and the idea occurred to him of having the *carte* written in 'prescription Latin.' Here's the result, and if any of our friends can send us the

menu in cook's French—well, we cannot give him as good a dinner as that was, but we shall be glad to do our best for him next Saturday night at 7.30.

DIE V. MENSIS AUGUSTI, 1873.

CHARTA PRANDIOSA.

Sorbitio Chelonis perlucida.
Pisorum turgidum, sicut apud Condé, jusculum.

Simplices Hæculæ atque piperatæ.

Rhombus, Homarique condimentum.
Salmonis, Armoracis cum jure, frigida segmenta.

Olivæ Hispanicæ condituris fortæ.

Aura, more thesaurario.
Coturnices, cum Lycopersicis comminutis, exossatæ.
Lardo suffixi, Cucumeris super assulas, Thymi Agnorum.

Hepar opinatam secundum Lucullum.

Clunis ferina assa.

Acetaria, more Italico.

Lepuscula. Meleagris parvula.

Tubera in Mappa instructa.

Malorum Armeniacorum conditus, crustulatâ inclusus.
Gelatina, more Scythico, multicolorata.
Flatus glaciatus Vanillâ odoratus.
Caseus, condito cum Selino albato.

Tosta apud Hæcem siccata.

Not often in a life time does one get a dinner like this, and not only did it deserve—to follow out Dr. Johnson's theory on epitaphs—to be written in Latin, but it merited being printed, as it was, in gold!

THE TIMES OF TAIKO.

(FROM THE JAPANESE.)

BY F. BRINKLEY, CAPT. R. A.

ISHIKAWA GOYEMON.

Chapter XVII. TORTURE.

AT the Palace of Pleasure, the three conspirators, Hidetsugu, Bansaku and Kumagaya (who had been admitted to the Minister's confidence) impatiently awaited the result of Goyemon's enterprise. Bansaku was the most sanguine, yet not the least anxious. It did not occur to him, indeed, to associate Ishikawa's action with failure, but he remembered that his success would be only a preliminary, and that the possibility of utilizing that success depended on a condition mainly under the control of chance.

The interval between dawn and the conclusion of Goyemon's attempt must be sufficient for Bansaku's own undertaking. A day's delay would render the precautions suggested by the absence of the censor no less formidable than its presence at the Regent's side.

Strange to say, this consideration had not occurred in time to be profitable. No doubt the danger of tardiness as well as his own natural energy would accelerate Goyemon's proceedings, but in the absence of instructions to the contrary, anything might induce delay, and delay too probably meant ailure and disgrace for Bansaku. Still the idea of retreat never presented itself. It was sufficient that he had promised, whatever that promise involved, and so, concealing his anxiety as best he could, he waited.

But when the hours, wearing slowly on, brought only feeble moonlight and the interminable drone of the cicadas, apprehensions, no longer contingent but actual, began to visit the watchers. What if Goyemon were taken with the tabard in his possession? Taiko could not fail to recognize his gift to the Minister, and then discovery and ruin would depend entirely on Goyemon's fortitude. And a wondrous fortitude it must indeed be, to resist the tortures that would assuredly be employed to shake it. Bansaku found the conception so terrible that necessity alone, he determined, should oblige him to entertain it.

Two hours after dawn a messenger from the Regent's court arrived at the palace. Received by Bansaku and Kumagaya, he described the attempted theft of the Lapwing censor, and its envelopment by the robber in a brocade tabard, so closely resembling the Nobunaga heirloom, that the Regent had ex-

pressed a wish to compare the two, and with this object sent him, the messenger, to carry the Minister's tabard to Fushimi.

Bansaku at once adopted the only course that offered any reasonable prospect of extricating his master from this dilemma. He said that having charge of the tabard himself, he would immediately carry it to Fushimi, and begged the messenger to precede him with this assurance. It seemed only honourable that he should assume the whole responsibility of a crisis induced by his own counsels, and under the influence of this impulse he set out for Fushimi, rejoicing, if the truth were told, in the prospect of anticipating his dishonour by death.

The revelations to be extorted from Ishikawa Goyemon were of so important a nature that the Regent signified his intention of being present himself at the examination, which was accordingly deferred till the receipt of the Prime Minister's answer. Bansaku therefore found the Privy Council assembled in expectation of his arrival, and could not fail to observe the significant looks exchanged as he presented himself empty-handed. Knowing however, how essential it was that his statement should not be disfigured by any confusion or hesitation, he introduced himself simply as an emissary commissioned to convey his master's congratulations on the fortunate arrest of the thief and the rescue of the precious censor. This induced a recapitulation of the circumstances attending the capture, and during the conversation that ensued, Bansaku, by certain unmistakable indications, arrived at a conviction that filled him with consternation: behind a curtain that draped the north side of the council chamber, Taiko was seated listening.

No incident could have suggested a more disturbing idea of the Regent's suspicions. Bansaku did not abandon his programme, but he prosecuted it thenceforth without hope.

"I understand," he said, looking unflinchingly at Sir Ishida, who acted as the Council's spokesman, "that the thief had in his possession a tabard of crimson brocade, closely resembling the one given to my master by—is His Highness. I hope sincerely it may prove to be the same, for His Excellency's tabard disappeared from the palace some ten days ago."

At this announcement, the five Councillors involuntarily turned their eyes towards the silk curtain, as though they expected to behold an intensified reflection of their own emotion. Ishida, however, quickly recovering himself, said significantly:—

"It is unfortunate that some report of this loss was not made before, Sir Bansaku."

"It is unfortunate," answered the comptroller, "but the fault is altogether mine. Believing that the measures I had taken could not fail to recover the tabard, and knowing how much its disappearance would distress my master, I have carefully concealed the fact from his knowledge. Under the circumstances my error can only be amended by my death, and I entreat you, my Lords, in the name of all that is just and honourable, to intercede with His Highness, so that he may accept my life and restore the tabard to my master."

An ironical smile spread over Ishida's face as Bansaku spoke. It was so very transparent, the device of this honest man, who constantly committed the error of accrediting others with his own guilelessness. Nevertheless the answer was courteous and conciliatory:—

"I think I may say in my colleagues' name as well as my own, Sir Bansaku, that we fully appreciate your motives, and will gladly give you our assistance. With your permission, I will at once take the Regent's instructions."

A little reassured by the councillor's tone, Bansaku awaited the result of an interview which fortunately for himself he did not witness. Taiko, as was the habit of his nature, had passed from willing incredulity to indignant conviction. His wrath only needed an agent to become destructive.

Even now, however, everything might be jeopardized by precipitancy, and for the first time, Ishida found himself acting the rôle of an honest intercessor. He pointed out that Goyemon's confession would assuredly supply irrefragable proof of Hidetsugu's treason, and consequently of his chief vassals' complicity also, but that in the interim it was essential to temporize with Bansaku, lest he should establish his statement by suicide, as he was evidently prepared to do, and thus in a great measure invalidate the admissions extracted from the prisoner.

Taiko yielded to these arguments, and Ishida, returning to the Council Chamber, informed Bansaku that the Regent accepted his excuses, but not the sacrifice he proposed, for if

the loss of the tabard warranted a charge of culpable negligence, what should be said of the censor, saved from a similar fate by mere accident? The comptroller might therefore be assured of His Highness' sympathy, and Ishida charged himself with the restitution of the tabard in due course. Bansaku had no choice but to accept this decision, though its excessive suavity confirmed, rather than relieved, his disquiet.

Everything now depended on Ishikawa Goyemon's confession.

Beyond the extremity of the most westerly wing of the castle stood a building of more than ordinarily solid construction, surrounded by tall bamboos, and connected with the main edifice by a long, covered alley. A high palisade, starting from the entrance of this alley and stretching away among the groves at either side, prevented approach or scrutiny, though indeed light and vision seemed already sufficiently baffled by the closely barred gratings which, hardly descending to the level of the eaves, constituted the only openings in the sombre area of three sides of the structure. Stern and forbidding in its exterior aspect, the interior of the building presented at first sight the appearance of a hall destined for mechanical experiments or some rude species of gymnastics. The floor was for the most part of clay, beaten to consistency and worn to ruggedness, but at one end a raised dais, matted and not devoid of embellishment, formed the foreground of a recess shrouded by bamboo blinds. Ropes, leather bands, pulleys, iron rods, an instrument resembling a close pinned harrow and two piles of heavy flat stones furnished the left of the room, while the right was occupied by a narrow platform, the timbers of which were laid so as to form a rough surface after the fashion of a saw's teeth. This platform served apparently for the passage, backwards and forwards, of a large wooden horse mounted on rollers, and remarkable for the shape of, its back, which instead of being round, terminated above in a long, sharp edge.

This was the Inquisition Hall of the castle. In the recess of the bamboo blinds the Regent himself was seated, while the dais was occupied by Ishida and Nagatsuka, councillors of state, attended by a number of inferior officers.

Goyemon was led in with his arms bound behind his back. As soon however as he had been placed kneeling before the dais, his hands were released and the bonds transferred to his feet. He made no semblance of obeisance to his judges, but stared at Sir Ishida with a look of smiling disdain that disconcerted the councillor not a little.

"What is your name, burglar?" demanded Ishida haughtily.

"Sakichi, a page and tea-server," was the mocking answer, delivered so rudely that the audience were more disposed to marvel at the prisoner's temerity, than to be amused at this allusion to the baron's early career. Ishida himself seemed the least concerned of all. He pursued, calmly:—

"Your name can, as you well know, be easily ascertained, and you will do well not to augment your crime by frivolous impertinence."

But Goyemon, directing his attention to the recess where the Regent sat concealed, treated Sir Ishida's rebuke with complete indifference. The baron therefore resumed:—"We are perfectly well aware, that, in attempting to steal the Lapwing-censer, you were merely acting as another's agent. This fact, though it extenuates your crime, does not excuse it. You have it in your own power however, to save your life by confessing the name of your employer, observing that if you refuse to do so, every bone in your body will be broken before you leave this room."

Goyemon prefaced his answer to this terrible threat by a contemptuous laugh. "I am at the head of my profession," he said, "and acknowledge no authority but my own will. Taiko valued his censor; so did I, but as I saw no prospect of his giving it to me, I determined to take it. I congratulate you all on my failure, and since you desire a confession, I am willing to admit"—here he paused to enjoy the interest his words excited—"I am willing to admit that I acted as the agent of—Ishikawa Goyemon."

Sir Ishida was for a moment deceived, but observing the mocking expression of Goyemon's countenance, understood that this was a fresh impertinence.

"Your own name, I presume?" he enquired.

"My own name, at your service," Goyemon answered bowing slightly.

The confession they had so confidently expected began to appear a little less certain to the councillors.

"It is impossible to believe, Ishikawa Goyemon," said Sir Ishida, "that a man of your capabilities would have adopted the profession of a robber for its own sake alone. It seems much more likely that you acted in obedience to some mistaken obligations of loyalty or engagement, ignorant, most probably, of your employer's ultimate object, which I now tell you was the murder of His Highness, the Regent."

A stir passed through the audience at this statement, for which the main part were entirely unprepared.

"This being so," continued Sir Ishida, "you have it in your power, not only to atone for your crime, but even to establish a claim to the reward of fealty, by disclosing the name of the traitor that commissioned you, and unless I am very much mistaken, this may be the beginning of a career for the success of which I pledge my name and influence."

"Ha! ha!" laughed Goyemon. "I had heard what a subtle rhetorician you are, Ishida, and I see report does not overestimate your capabilities. That tongue of yours must have been no mean ally in your various plots and schemes, and perhaps—for women, they say, are easily won by words—perhaps it has pleaded your cause successfully with Chika herself. But let me tell you—though I should be sorry that the warning lessened your disappointment hereafter—even if your infamous treachery achieves Hidetsugu's downfall, all your power will not avail to save Chika alive, and when you shall have betrayed your master and murdered your love, I, Ishikawa Goyemon, promise you—for I know—that one lonely night's communion with your own black heart will bring you more agony than all the tortures I am about to suffer here before you."

Truth has often strength to awaken an instinctive perception of its presence under the most unlikely circumstances, and if the verity of these solemnly spoken words required any confirmation, it was afforded by the effect they produced upon Sir Ishida. He seemed to shrink and collapse, as though the support of his life had been suddenly struck away, a ghastly pallor overspread his features, and in the glance he involuntarily directed towards the Regent's seat, it was easy to read consternation, confusion and despair. Whether this accusation sounded false or faithful to his hearers, it was equally ruinous to his hopes, since their consummation would now necessarily condemn him, and from that moment he knew that the curse of his crimes had begun to fall upon him.

After a moment's silence Goyemon resumed, pursuing his advantage with merciless determination:—"No doubt you now regret the imprudence that persuaded you to be my judge, Ishida, and in truth I your prisoner, I who am doomed to suffer I know not what death, can almost pity you when I remember that to escape your evil fate, you dare not halt in the path you have entered, though it leads no longer to Chika's pillow, but her grave. If posterity calls me a thief, it will christen you a catiff, Ishida, and even in my present plight, I would not change places or reputations with you. As a villain you are certainly well fitted to judge villainy, but you are incapable of appreciating a brave man's contempt for the mercenary arguments you employ."

Seeing that his colleague was for the moment unable to prosecute the examination, Nagatsuka now addressed the prisoner:—

"In your present position, Goyemon, your recriminations have no weight, either to move or to asperse. The insolence of a criminal may excite a judge's contempt, but not his anger; neither can it turn him from his duty. You call yourself a thief, forgetting that thieves steal goods or gold, while, had you succeeded in your attempt of last night, you know well that so long as you valued your life you must have kept the censor concealed. You could neither have made use or profit of it. The same argument applies to the brocade tabard found in your possession. It was the property of the Prime Minister, and is at once too remarkable to be safely stolen and too precious to be lightly lent. All this proves plainly that you are no thief, and though we admire the feeling of devotion that induces you to traduce yourself and brave torture and death, we should give you still greater credit, did you abandon and denounce a master that you now know to be disloyal."

Goyemon did not treat his new inquisitor with any greater deference than his former one.

"Have you then proved to yourself, Nagatsuka," he said, "that I am no thief? With your permission, I will now prove to you that you are a fool and incompetent. A fool, because while history tells of such men as Fujiwara, Kuma-

zaka and Tojiniudo,* you still believe that thieves can only be influenced by the desire of gain: incompetent, because, being a judge and councillor, you have failed to discover in Ishikawa Goyemon the prince of all the robbers that have hitherto existed. For your instruction and humiliation, I will describe a few of my exploits. I began my career by stealing two thousand riyos from your own armour-chest. I sent your colleague Ishida with his men-at-arms on a fool's errand to Fushimi, and during his absence, carried off from his castle the proceeds of half a dozen years' savings and extortions. I took the place of the Imperial Delegate, and for a large bribe compounded with the murderers of Nagatsukasa, Earl of Tamaru. I have personified Taiko's commissioner of Examination in fifteen different provinces, and extracted immense sums from the nobles who had avoided the war imposts by false representations. I have visited all the principal temples in Japan, and wherever I found lying priests preying on the superstition and fanaticism of the people, I have carried off their treasures and exposed their impotence. I have done all this and much more, but I have never robbed an honest man nor refused to aid a needy one. And while the whole country was ringing with the rumour of these deeds, and you, wise councillors, judges, sheriffs and so forth, were moving heaven and earth, after your own bungling fashion, to discover their perpetrator, I was living at Kiyoto under your very eyes, possessor of more wealth than I could have spent in a century. Do you still doubt that I am a robber, Nagatsuka? Verily you should have known better, seeing that you are one of the same craft, though of a very different kidney. For though oppressing the poor, selling injustice, deceiving your master and plotting against your rulers may be fashionable knavery, I should despise myself if I practised it as you do. And now once for all, enough of these inexpert questions and hypocritical sermons, which become absurd in the mouths of such as you and Ishida. If you fancy you have more to learn from me, entrust your case at once to your minions and to these instruments that are independent of your incompetence."

It is impossible to describe the effect this statement produced on its hearers. Among the officials present not a few had been Goyemon's victims, while all had been engaged at one period or another in fruitless attempts to unriddle the mystery of the crimes he had now confessed; crimes whose number, variety and apparent ubiquity, as well as the official incompetence their perpetrators' immunity testified, had passed into the title of the time:—"licensee's manhood and law's dotage." Astonishment and rage were painted on every face. Here before them; disdainful and defiant, sat the author of their loss and their disgrace, laughing at their threats and glorying in their discomfiture. Even Sir Ishida forgot the death-blow his prospects had received in his thirst for vengeance, and all the members of the court turned their eyes longingly towards the instruments of torture, by whose aid they hoped now at last to vindicate their insulted dignity.

Goyemon noted this disposition, but betrayed no emotion. Within an arm's length of the place where he was kneeling, sat two men whose dress betrayed the physicians always in attendance at examinations by torture. Beside their medicine chests stood a small brazier supporting a vessel of boiling water. Goyemon stretched out his hand, took the vessel, and turning to the councillors, said:—"In order that you may save yourselves the trouble of employing such useless agents as fire and water, I give you here a proof of their inefficacy."

With these words he slowly and unflinchingly poured the contents of the vessel over his left arm. Many a strong man averted his eyes with a shudder, as the white flesh rose in large flaccid blisters from wrist to elbow.

"Goyemon," said Sir Ishida, "self-inflicted pain is easily borne. We shall see presently whether this is fortitude or bravado. You have now to confess the names of your accomplices, as well as that of him who employed you to steal the censer. Once more will you do so willingly, before the avowal is wrrenched from you by such tortures as no criminal ever before suffered?"

"I should be sorry to deprive your brutality of the spectacle it anticipates, Ishida," replied Goyemon, bowing with mock courtesy.

The etiquette of clemency was now amply satisfied. Ishida made a sign to a party of *shirri* standing at the back of the dais. Six of their number immediately placed themselves,

* Celebrated bandits, supposed to have embraced their profession from motives of ambition.

three on each side of the prisoner, while one, apparently their leader, came and knelt before the judges. Ishida, understanding that he awaited instructions, drew the figure of a crescent with the handle of his iron fan on the matting, whereupon the man bowed and retired. It seemed as though the silence of shocking anticipation had fallen alike on judges, executioners and spectators.

One of the doctors now drew a large pair of forceps from his instrument case, and looked enquiringly at Sir Ishida, but Goyemon, perceiving this, said:—"You may leave me my teeth, Ishida. I promise you not to baulk your projects by biting out my tongue at any rate." The doctor, plainly glad to accept this engagement, replaced his forceps, and the *shirri* proceeded to bind Goyemon's wrists tightly behind him.

This done, an instrument known as the "friction-trees" was produced. It consisted of two pieces of hard-wood, some three feet long, slightly curved, and triangular in section. On one of these, laid with its concave surface upwards—the prisoner was obliged to kneel, while the other was forced between his calves and thighs. The end of the two "trees" having been tied together in this position, it resulted that the man's legs—midway between the knees and ankles—were held in a tightly fitting wooden arc, always presenting a sharp edge to two of the surfaces it touched. Finally, a long iron bar was thrust perpendicularly between the victim's hands and his back, forming a sort of lever, (the fulcrum being at the lower end and the point of application of the force at the upper) by pressing on which he was obliged to remain sitting on his heels.

Goyemon not only offered no resistance to these arrangements, but even facilitated them as far as possible, and so soon as he saw that everything was prepared, he himself ordered the *shirri* to commence.

The men were evidently disconcerted by this extraordinary stoicism, but their duty was a very simple one. Two of them, grasping each an end of the trees, drew them rapidly backwards and forwards, at first with apparent difficulty, but presently aided by a deluge of blood. It seemed as though the man's legs must soon be cut in two, yet the few who could endure to observe him, saw that neither by voice or motion did he give any evidence of suffering.

At every tenth passage of the trees, the *shirri* that held them were relieved, and before each repetition of his torture, Goyemon was asked to confess, but he maintained a dogged silence. The eighth query finding him still determined, the process was abandoned as unsuccessful.

A harrow with wooden pins was now brought forward, and Goyemon was placed on it in a kneeling position. He shuddered slightly as the sharp points pierced his wounded legs, but withal his nerves seemed firmer than those of the men that held him.

Heavy flat stones were then heaped, one by one, on his knees, an exhortation to confess preceding the addition of each weight, but though the pile at last reached so high that only his livid face and blood shot eyes were visible above it, no sound escaped his lips.

This silent suffering was terrible to behold. When the stones had been removed from his knees, half the officers present, including Nagatsuka himself, crowded round Goyemon, and urged, nay entreated him to confess. For a long time he paid no heed to their words, but when at last it was pointed out to him that his judges had no longer any discretion, since the law made the discovery of his accomplices an imperative necessity, he answered that those who had aided him in his enterprises were not his accomplices, but his servants, and that deprived of his leadership, they would be incapable of anything. "The leaves and branches," he added, "wither of themselves when the trunk is dead. I alone have outraged the laws, and in my punishment alone will you, their guardians, have an opportunity of vindicating them. Exact therefore the fullest penalty you may, for I tell you that your vengeance is bounded by my life."

"In heaven's name, Goyemon," urged Nagatsuka, "abandon this fruitless obstinacy. Reflect that we have power to prolong your tortures day after day, and that, held between life and death, the secrets of your heart will surely escape you in the delirium of agony. Can you then be sure that your tongue, no longer obedient to your volition, will not extend your fate to some one, it may be a wife, it may be a child, for whom you would now gladly suffer a hundred deaths? Have you no care for them, no wish for rest yourself?"

For the first time, Goyemon appeared to be in danger of losing his self-command. He trembled violently and looked wildly about him, like one who finds himself suddenly in the presence of some appalling peril. Sir Ishida, observing these symptoms, held up his hand to enjoin silence, and all listened breathlessly for the confession that seemed about to come.

But memory, not fear, had produced this transient weakness. It passed away in a moment, leaving Goyemon firmer than ever. "There are feelings stronger than the sense of pain," he said, "and they will preserve my reason. As for rest, shall I not presently have an eternity of quiet?"

After these words not one, perhaps, of those present entertained a hope of subduing the man's unflinching courage. Many, indeed, would fain have arrested the progress of so fruitless and merciless an ordeal, but there was no longer any choice. The inexorable law acknowledged but one limit, the prisoner's death, and the immense physical energy that had hitherto sustained him, presaged a long term of suffering before that limit was reached.

If however his torturers might not relent, they could at least be speedy. The next stage was so terrible, that it always brought its own relief, insensibility. The prisoner was placed astride on the sharp back of the wooden horse, and in this position heavy weights were attached to each of his ankles. The horse was then drawn backwards and forwards by means of pulleys over the platform of rough logs. Every jolt caused excruciating agony, and by multiplying the number of the stones used as weights, and augmenting the speed of transit, the victim's body might be almost torn in two. It was not, therefore, customary to apply this ordeal in its extreme severity at once, but to proceed by small increments of weight and velocity. In Goyemon's case however, two stones, each a stout man's burden, were suspended on either side, and the horse was drawn at full speed up and down the platform, once, twice and then a third time. Strange and unnatural sounds, half groans, half wails, broke from the miserable man's lips while the motion was continued, but before the completion of the third passage, he fainted.

At no time is man's antipathy to active suffering keener than during the moment of sick faintness that accompanies recovery from the paralysis induced by pain. Memory, unable to recall the exact degree of agony to which nature yielded, has recourse to imagination, and conjures up a phantom from which the shattered nerves shrink with all the more terror because of its vagueness. This fact was well known to the officers charged with Goyemon's examination, and in it rested their last hope of extorting a confession. As soon therefore as the first signs of returning consciousness appeared, the *shirri* proceeded to cauterize his wounds with red hot irons. Thus recalled to life by an anguish even more excruciating than that which had benumbed his senses, and horrified by the shocking nature of his new torment, he struggled for a moment to recover his courage, and then, after a few heart-rending moans, fell into violent convulsions.

There was danger in this condition: the danger that a power stronger than pain might step in and rob the law of its victim. The physicians employed all the resources of their art to prevent such a catastrophe, and after a time they were successful; successful in restoring physical calm, but with such an accompaniment of exhaustion, that further resistance seemed impossible.

Goyemon being again exhorted to confess, replied:—"Confront me with the Regent and I will reveal the name of my master in crime, but to Taiko alone will I do so. If this cannot be, finish what you have begun. I have suffered the worst and will die in silence."

The torture had done its work; the man's spirit was at last broken. His spirit was broken, but of the process, this at least must be recorded, that among all those who witnessed his submission, not one had conceived a higher limit of endurance than that attained by this robber's fortitude.

It would have been unreasonable any longer to doubt that Goyemon had been employed by Hidetsugu. This resolution to confess to Taiko alone could bear no other interpretation. Notwithstanding the important nature of the expected revelation however, it is scarcely probable that Taiko would have consented to such an unusual proceeding, had not his own observation convinced him there was no alternative. As it was, his permission was accorded in opposition to the advice of many of the courtiers, and notably of Mayeda, Duke of Kaga, who contended that an interview with such a malefactor must degrade the Regent

in the eyes of the people. But Taiko was blinded by an angry desire to obtain proof of the Prime Minister's treason. He gave orders that Goyemon should be brought into his presence.

(To be continued in our next.)

EXTRACTS.

THE AMERICAN PRESIDENT'S VETO.

(From the *Economist*.)

WE do not know that there is anything in modern constitutional history which is better worth noting than the degree and kind of success which has attended the American Presidency. The framers of the Constitution, influenced partly, no doubt, by the tradition which made a King seem indispensable to a State, partly by the necessity for a strong Executive—always imagined after a long war, when a nation is apt to think of itself as if it were an army—and partly by the reverence felt for the man who was sure to be first President, and who it seemed probably would be President for life, invested the President with the full powers of a Constitutional Monarch, and with the Premiership beside, and he has exercised them unopposed ever since. The elaborate scheme framed by the same men for the election of the President has hopelessly broken down, and that officer is now elected on a plan which is as rough as a mass vote, and yet does not give to the object of its choice the full moral sanction of a *plebiscite*. The President is chosen by the populace, and yet may be chosen, as Lincoln was on his first nomination, and as Mr. Hayes was, by a minority of the electors who recorded their votes. The idea of choosing the ablest or most trusted man to be had has not been found workable, and American Presidents have varied in political rank from Washington to Franklin Pierce—a bad nonentity—and from Madison to Andrew Johnson, a drinking rough of unusual innate capacity. Nevertheless, from first to last, through more than a century of time and an immense variety of circumstance, the Presidency has been a success. The people have always been inclined that the President should perform his legal functions and exercise to the full his legal powers. No King or statesman has ever been more cordially abused, or less respected, or more openly resisted, but there never has been a time when a President, supported by a minority of one-third, plus one, could not veto an Act, or employ the army as he pleased, or dismiss and appoint any member of his Cabinet. After a hundred years, the American President can still treat Cabinet Ministers as clerks, still remove any official he dislikes, and still lock the legislative machine so that it cannot move, without any fear of consequences. General Grant was declared in a thousand newspapers to be a low horse-jockey, a bribe-taker, and a wine-bibber, and, though he was none of these things, he was undoubtedly an inferior politician; yet he remained to the end of his second term the most powerful personage in the Union. Mr. Hayes, the present President, reigns by a very doubtful legal title, and with no moral title at all; yet if he vetoes the Bland Bill, which is supported by nearly two-thirds of Congress, and quite two-thirds of the people, there will be no serious resistance to his action. A great many journalists will comment severely on the "one-man power," and a great many electors will vow audibly not to re-elect him, but of serious anger that he should so defy the people, there will not be a trace. Indeed the feeling will be slightly the other way—a slight additional liking for Mr. Hayes because he has had the courage of his opinions, and has "put his foot down." He will be considered perfectly justified in setting at defiance the formally-expressed and most deliberate will of the majority of the nation.

There is nothing in the least like this fact, that we know of, in the history of modern popular institutions—nothing so entirely unlike the action we should *a priori* expect from a democracy. No people under a Constitutional Monarchy allow their Sovereign this power, and no President of any other Republic has ever been able to claim it safely. In the very latest Constitution of France, a Constitution intended to be Conservative, and to pave the way to a Monarchy, the power of the veto has been carefully omitted, and a clumsy substitute found for it in an exaggeration of the independence of a not very much respected Second Chamber, placed in practice under the control of the Executive. Yet one would not say at first sight that the American people was likely to bear patiently with the authority of a single man. It is a people used to be managed, rather than governed, by committees, very jealous of official authority, very determined not to allow any approach to a monarchical system. Yet it submits to the authority of a single officer, often personally not respected, as quietly and with as little complaint as if he commanded an irresistible army. It is quite certain that the English people, supposed to be so law abiding, would not do so, and why does the American?

We suspect that the true explanation, unlike most political explanations, is a satisfactory one, at least for those who hold it good for society that the Executive should be strong, namely that we none of us quite know how much power the people will delegate when the contest between them and authority is finally over. The American electors do not suspect the President of aspiring to more than legal power. They know almost without reasoning that it is impossible for him to obtain such power; that if he stepped over the law nothing but universal opinion could protect him—that, in short, they themselves are masters past all resistance or discussion. If the President gives reason for suspicion, they can dismiss him at the next election; if he breaks the law, they can enjoin Congress to impeach and dismiss him without waiting even for that short period. European thinkers may speculate on contingencies, but no American ever dreams of circumstances in which a President could force himself upon the people for a second election, or hold power for half an hour in default of one. He would be sent to prison, or sent home like the commonest rough who had irritated the community by an act of indecency or violence. This profound sense of security cures suspicion, and when unsuspicious, a democratic community rather likes to give large powers, and to see the large powers it gives fully exercised. It realises, under such circumstances, its own might, and takes pleasure in it. It looks upon the elected head of the State, who is so painfully visible and so intelligible, and so much more human than any Assembly whatever, as its own special representative, and rather enjoys seeing him snub anybody else, even the representatives, or the people itself. He is there to be a restraining power in the people's name, and he is a restraining power; and as the people can always have their own way at last, he is approved. It must be remembered that he can do nothing. The American president, great as his prerogatives are, cannot levy an extra penny a gallon on whiskey, or add a regiment to the army, or arrest an individual at his own discretion. All he can do is to compel Congress, or as in the case of the Bland Bill, the people, to reconsider its judgment; and the people, which half distrusts its representatives, and is not quite certain about its own judgment till it becomes practically unanimous, likes to see him do that. What is he there for, placed up so high above the poor farmers who elect him, if he is not to have a strong opinion, and to act on it? He can do no harm beyond causing a delay, and about delay democracies never really care. The notion that they are impatient is, we feel assured, almost entirely a delusion, arising from the experience of countries in which democracy is not yet real. The educated classes are impatient because they see the evil caused by uncertainty, but the body of the people who do the same thing day after day, who are not irritated by too many thoughts, and who are never frightened, wait through very lengthy delays with great tranquillity, find indeed in those delays a certain opportunity of making up their minds decisively, which they approve. The duration of the American feeling about the conduct of England in the matter of the Alabama amazed Englishmen, and so did the quiet persistence of the French peasants in the struggle with Marshal MacMahon. In the latter case everybody supposed that the long delays purposely enforced would alter the popular will, that the people would not keep its determination, but it did, and probably—though of course this is beyond proof—grew all the stronger in its resolve for the time which intervened. The people, were not suspicious, are never in a hurry, and are never annoyed at seeing legal power exercised somewhat strongly, and those two facts which preserve the American Presidency are perhaps the two most hopeful facts notable in the modern progress of democracy. We saw one of them very recently in England. When Mr. Gladstone abolished Purchase by an exercise of the prerogative, statesmen murmured that this was not Parliamentary Government, but the body of the people, which has long ceased to be afraid of prerogative took that view so little, that it was found impossible to raise even a serious discussion. It is not of a weak Executive that Liberals, as the popular power advances, need to be afraid, but of an Executive a little too strong to be resisted when resistance is considered advisable by those who do not share the sentiment of the crowd.

SIR RICHARD TEMPLE AND THE PARSEES.

(From the *Bombay Gazette*.)

IT would be easy for some good-natured friend of the description emphatically immortalised by Sir Fretful Plagiary to suggest to the present Governor of Bombay that he must be suffering severely from *cacoethes loquendi*, for during the past few months he has been making speeches at an alarming rate, of an alarming length, and with an equally alarming affectation of Oriental learning. It may be questioned whether he does much good by his laborious efforts in public-speaking, so that his medical advisers

might advantageously hint that a little silence would do him good and relieve the minds of those who are watching his career with some anxiety. We are not even sure that some of his speeches have not done harm by their invidiousness, however well meant they may have been. On three recent occasions the Parsees have had three formidable speeches all to themselves, while the other great sections of the native community have not been so honoured—a distinction which very possibly is the cause of a little irritation and jealousy. The position he has assumed towards the Parsee community is very like that of a father. He praises them, glories with them in the pride of their ancestry and blue blood, and then turns round and lectures them upon the state of their morals. The Hindoos and Mahomedans are perhaps disposed to grumble because he does not aspire to be their father, too, for they feel they have as much right to be petted and lectured as their brethren the Parsees. However, we advise them to have a little patience. Their turn will come some day, when Sir Richard will spread abroad his hands and say, "bless you, my children!" in three or four columns. We are certain that his sympathies are too large to find adequate room for expansion upon Parsees alone. Moreover, those sections of the community may find consolation in the reflection that perhaps Sir Richard's addresses to the Parsees have not been very flattering after all, for we think that they contained some bitter truths which were so nicely tied up in big sentences that at first they were not perceived by the persons for whose digestion he had prepared them. It may be the old story of the fox and the grapes over again, but if we were the jealous communities this is certainly the way we should look at the matter. A father is often a very desirable acquaintance to possess, but when he happens to be exceedingly fond of talking, and of saying things you have often read of before about virtue, morality, and industry, he is apt to become just a little tiresome. After Sir Richard's last speech at the Newsaree Tower of Silence—from the name of which he scorned to take a hint by holding his peace—we daresay that even the Parsees are beginning to find out that having a Governor as a parental adviser is not an unmixed blessing. So we would ask the Hindoos and Mahomedans not to fret too much if, up to this time, Sir Richard has not found leisure to make them several long speeches specially prepared for their edification. If he chooses to tell the Parsees that they boast of the bluest blood in the world, they may console themselves by reflecting that at the very least, according to the best present human information, they sprang from Adam. A Norman nobleman once proudly told an Anglo-Saxon that his ancestors had come over with the Conquest. "But I think my ancestors were there to receive them," was the reply. The moral of the story is obvious: if ever a person has existed with blue blood, why, there are people who can point to the Creation, and say that their ancestors must have had "blue blood" also. And, again, if it pleases Sir Richard to dilate on the fabulous deeds of Rustom, or to point a moral with the Persian peacock called the Shah-murg, or even to expatiate on the deeds performed by Zal through the inspiration of that wonderful and eccentric bird, they may cheer their souls with a remembrance of the glorious deeds of a thousand ancestors—their Ghenghis Khans, their Alarics, their Timours, their Babers, their Humayoons, their Shah Jehans, their Aurungzebzes, *et hoc genus omne*. So you see, there is very little after all to fret about. Ancestry is not much less ancient for one person than another. Even a village pariah must have an old genealogical connection, and although the details of the connection may be unknown, still remember that nothing can spring from nothing, and that if the satellites of Mars were not discovered until the other day that was scarcely the fault of the planets. Even a potato must have an origin coeval with the magnificent palm trees that we will take for granted adorned the shady lanes of the Garden of Eden. Why, it is not so very long ago since the full-dress of the ancient Briton was due entirely to an arrangement of a few feathers more or less appropriately distributed over his body, and the application of one or two bright and elementary paints.

Sir Richard Temple has a wonderful love for the "Shah-nama," or Persian book of kings. It would appear that on the slightest provocation he must break out about it. In his remarkable speech at the late Sir Jamssetjee Jeejeebhoy memorial meeting, it was brought in to adorn most of his morals. Its stories about that awful Rustom were used to teach the Parsees that if they cannot now ride, draw the bow, or speak the truth, in the same degree that the ancient Parsees were taught, they may at all events endeavour to perfect themselves in such gymnastic sports as cricket. Again, the mere fact of its ever having been written was employed to prove that Parsees and Mahomedans should ever live together in brotherly love, because it was to the encouragement given by Mahomedans to literature that it owes its existence. In conclusion, after having conveyed to his listeners the obscure

lessons that may be drawn from the Shah-nama, Sir Richard said that there is no class the British Government likes better than the Parsees; that there is no class in whose loyalty it reposes greater confidence than that of the Parsees—all which may be quietly accepted as the compliments due to the occasion, to the speaker's desire that the morals drawn from the Shah-nama might be made acceptable to the community at which they were pointed, and to illustrate his apologue that nowadays the British Government is the Shah-murg to which the Parsees, as the descendants of Zal, must look for protection. His desire to make the Shah-nama a powerful inculcator of morality was shown even more markedly at the Nowsaree Towers of Silence the other day. If his meaning before was veiled, there could be no mistake about it on that occasion. Sir Richard seemed to say.—If my intentions were not inserted into the Parsee community on the point of a delicate rapier, they shall be knocked into them this time with a bludgeon. He practically told the Parsees that not only were they lazy, but that whereas their ancestors were, among other things, taught to use the bow and arrow and speak the truth, in these degenerate days the only bow they draw is the "long-bow"—which is very distressing. In the course of his long speech—delivered more or less directly in reply to one of those memorials expressive of loyalty for which the Parsees are remarkable—he quoted from Draper's "Conflict between Religion and Science" to prove that once upon a time the Persian kingdom was a very large one, and that they had built some very wonderful cities and buildings, and planned several gigantic schemes of irrigation. The Parsees of Nowsaree, if they did not know it before from the commonest rudiments of history, learned now that the pillared halls of Persepolis were filled with miracles of art in the way of carving, sculpture, enamels, obelisks, sphinxes, and colossal bulls; that Ecbatana, another notoriously famous place in Eastern history, was once defended by seven huge walls and contained palaces of which the roofs were (after the true characteristics of sumptuous barbaric art) adorned with gold and silver. An Empire containing such splendours could only have been consolidated with great labour—an obvious fact which the traditions of the inevitable Shah-nama were dragged in to prove. Zal, Rustom, and other Persian heroes were referred to; on this occasion the Shah-murg was permitted to repose in its grave of distempered imagination. Then an extract was read from a book called the "Blue Banner" by M. Leon Cahan, in which an account is given about somebody who was dramatically explaining that he was conspiring on behalf "of the nomads who have broad faces and scanty beards, like we have, against the men with long noses and bushy beards; it is the battle of the desert and the prairie against the cultivated land." We can imagine the feelings of the Zoroastrians who were gathered round their Tower of Silence as they endeavoured to discover what possible relation these quotations could have with the business in hand. Sir Richard, however, endeavoured to enlighten them. His moral, he said, was, that as long as nations are industrious, laborious, enduring and self-sacrificing, so long they are able to maintain themselves; after which he went on to advise Parsees to study and practise the arts of agriculture and soldiery. He regretted that there is not now a single Parsee bearing arms in Western India, and that there are very few Parsees holding the position of cultivators. The Parsees had become essentially men of the towns instead of men of the country. They had even abandoned to a great extent practising the arts of artisans, and had taken greatly to trading and shop-keeping. This they were tempted to do because they supposed they would be able to amass wealth rapidly; and "this habit of mind, this desire for wealth and luxury, tended in a great degree to personal extravagance." Moreover, it appears, as education spreads among the Parsees, there is a tendency among the young men to look to clerical pursuits and "to various professions in which men are expected to work with their brains instead of their hands." Then the Zend-Avesta was quoted to show that, if a nation neglect agriculture, then in the long run they will be without the means of subsistence.

If Sir Richard Temple's extraordinary address signified anything, it signified that the ancient Persians lost their kingdom because they neglected agriculture—a statement of the truth of which there is no proof whatever. They won their kingdom not by the ploughshare, but by the sword, and if they did not keep it it was because other men who were stronger than they were, interfered, and perhaps because the original holders of the sword had laid it past them on the purple couch of luxury and abandoned themselves to the pleasures of wine and dalliance—a weakness of all semi-barbarous conquerors. It was surely with singular fatuity that Sir Richard quoted with approbation that passage from Leon Cahan's book; because while he was endeavouring by a most laborious process—(suggestive of too much "attempting")—to prove the advantages of an agricultural life, he dragged in

and pointed with admiration to some hoary scoundrel who expressly declared that he was going to help to plunder the peaceful cultivators of Iran on behalf of the other scoundrels whom he euphoniously describes as nomads. In another sense, the applicability of Sir Richard's address is extremely doubtful. Even supposing that the ancient Persians did lose their kingdom because of their neglect of agriculture, what had that to do with the Parsee traders and shopkeepers whom he was addressing beneath the Towers of Silence of Nowsaree? He surely does not suppose that the Parsees are the owners of India, and that they will lose it if they do not become ryots! If he meant his moral to apply appropriately, he should have levelled it at the British Government and not at the Parsees, for it must be evident that if every Parsee in India were to take to agriculture to-morrow, and to abandon the trading and shop-keeping for which he has shown an especial aptitude, the event could not prevent India falling away from England one day sooner than would otherwise be the case. Moreover, if Parsees do prefer to make money at shop-keeping, what harm is there in the fact? Men generally take to what vocations suit them best, and if a person succeeds better in trade than he would either in soldiering or in cultivating the result is a gain to the whole community in proportion to the amount of wealth he has succeeded in accumulating. Sir Richard Temple takes to the Civil Service; Dhunjeebhoy keeps a shop; each succeeds; and what right has even the most rabid political economist or philanthropist to say that they would both have been much better off, and the stability of the Empire made firmer, if they had both chosen to be farmers? Sir Richard Temple concluded his address with some pretty broad hints about the character of the Parsees of the present day. David said in his wrath that all men are liars; the Governor of Bombay says in his leisure that the Parsees are not distinguished for their truthfulness. If the statement is true, we are sorry to hear it; but as every Parsee is perfectly well able to take care of his own character whether he has it or not, we do not consider it our particular duty to defend the Parsee community from the general charge of untrustworthiness. We are more concerned to show that in Sir Richard Temple's case occasional silence would be golden, and that the sections of the community who have not yet been specially adopted as his children have no great cause to feel discontented with their lot.

•• The dates of Arrival and Departure of the Mitsu Bishi Company's steamers are susceptible of alteration, consequent on the necessity imposed upon the Company—by its contract—of connecting with the steamers of the Pacific Mail.

•• No days for Arrival or Departure of the Pacific Mail Company's or Occidental and Oriental Company's steamers having as yet been fixed, we are unable to tabulate them. Each separate steamer's departure from her port will be notified in the Table below, and the day of her probable arrival at her destination.

•• Three days are allowed in the P. & O. Company's Schedule for transit of the Mails between London and Brindisi.

•• Two days are allowed in the Messageries Company's Schedule for transit of the Mails between London and Marseilles.

NEW SERIES. VOL. 1. No. 18.]

May 4, 1878.

[\$24 PER ANNUM.]

TREATY REVISION—THE JAPANESE YEN. II.

IN THE two articles which we devoted, last month, to the subject of silver currency in Japan, we condemned the Mexican Dollar to be relegated to its proper position here as bullion, and exhorted the Japanese Government to return, in its own coinage system, to silver as a standard, and to the silver *yen* proper—the coin originally designed by Major Kinder, of the same weight and fineness as the Mexican Dollar—as the sole legal tender for payments in coin. We reserved the claims of the Government's paper currency, by recommending them to make this a legal tender for all internal taxes and excise, but advised them to strengthen its position, and check its fluctuations in relative value, by announcing their intention to make their paper redeemable in silver on demand, at the earliest possible date. It remains for us to state what guarantees foreign governments, bankers, and merchants will require, to induce them to lend their aid in the struggle between the dollar and the *yen*, and to show what consequential advantages Japan may hope to gain, when that struggle has resulted—as it should do—in a victory for her own coin. We are informed that the Government is convinced of its error in attempting the establishment of a gold standard, and wishes to return to silver, but will propose to coin a *yen* of 420 grains. If it persevere in this, an additional proof will be given of the origin of the people. Another of the Ten Lost Tribes may lay claim to their parentage. We have already alluded to their relationship to Reuben—as instanced by that fluidity of character which precludes excellence;—should they persist in the attempt to put a 'trade dollar' into competition with the Mexican, they will go far to prove their direct descent from Issachar, the 'strong ass, crouching between two burdens.' The burdens are heavy—California and China.

It is not difficult to see how the Finance Minister has been misled into this error. Even assuming that he has had no interested friends of the American trade dollar at his elbow,—a large and charitable assumption;—he has had Japanese friends, returned from educating themselves in America, and saturated with all the faulty American theories on trade and finance. But Japanese statesmen must learn that Japan is by no means as big as America, and that any attempt to walk in her neighbour's shoes will only result in ignominious tumbles. The American Trade Dollar has its uses—to Americans. American silver-producers can afford to send out their bullion in this form, instead of in that of bar-silver. Their only object is to get rid of metal which their mines are producing, in excess of the world's demand for it in the uncoined state, and it pays them to cast it in little ingots, weighing 420 grains each, which will not buy silk or tea from China; but which can be sold for Mexican dollars weighing 417.60 grains each, which will. For to dig out and smelt their silver ore, and then to coin and transport these ingots which

they call 'trade dollars' are processes which cost them, in wages, &c. so little, as a percentage on the total out-put of their mines, that they can very well afford to give away two or three grains of silver, when selling their stamped ingots for the current Mexican coin. But Japan has no such teeming silver mines, and it is a very unprofitable business for her to sell her silk, or tea, or rice, or gold, for silver bars; to pay the cost of coining these into little ingots of 420 grains each, which she may choose to call 'trade dollars'; and then to sell these for the almighty Mexican,—and moreover to sell them at a discount. No coin bearing a nominal value was ever yet pushed out of circulation, or ever will be, by a similar coin of the same nomenclature, but of higher intrinsic worth. It never gets a chance. The intrinsically inferior coin buys it up and hands it over to the melting-pot, just as fast as it can be coined. Let the Japanese Government take this as a truth,—an axiom. We cannot waste time in furnishing demonstrations of axioms, and shall therefore let the simple statement stand. And it is with the Mexican dollar, not with the American silver-seller's ingot, that the Japanese *yen* has to contend. By all means let Japan buy the American 'trade dollars' with her *yen*—instead of buying bar-silver—if she can buy them on the same terms as the Mexican dollar does—at par or at a discount;—her coinage from these will be more profitable than coining from bar silver;—but in her contest with Mexico for the supply of coin for the China trade she must fight with exactly even weapons. So only has she a chance of success, for—paradox though it seem—it is a certain, absolute, fact—that in such a contest the better coin has the worse chance.

The question has now to be considered: what guarantees must Japan give to foreign governments, bankers and traders, that the coin with which she hopes to supplant the long-established Mexican dollar will justify their support? We may take it for granted that the Japanese government realizes the fact that, without such support, that object will not be achieved. And we trust that it also understands that we are not likely to disturb existing monetary arrangements, and so radically change the course of trade as to make Japan, instead of Mexico, the Mint for our China trade, without guarantees full, satisfactory, and permanent for a reasonable period, that we shall not hereafter be inconvenienced by the necessity of making yet another change. This Review gives, as every foreign journal ought to give, an independent support to the government of the country, and strives to aid the people in the development of the country's resources; for the stability of the former, and the welfare of the latter are both needful for the success of foreign trade: but we are not blind to the faults and shortcomings of either people or government, and have no object in flattering one or the other by pretending to be so. Neither have yet sufficiently de-orientalized themselves to have become trustworthy; and

until a generation of Japan's statesmen have learnt that successful deception is not diplomacy, and a generation of Japan's merchants that Credit is the life of Commerce,—so long must foreign Powers and foreign bankers ask for bargain-money from her traders and guarantees from her government. In such an important matter as this,—of committing to its charge the coinage of the medium of exchange for a large and rapidly growing trade, in which far larger interests than her own are concerned, the errors of the past, the circumstances of the present, and the temptations of the future have all to be duly weighed: the currency frauds of 1866—1870 cannot be forgotten, the pressing necessities of to-day must be regarded, and in forecasting possibilities, we must guard against official corruption and inherent popular vice. There appears to us but one satisfactory way of fulfilling all these conditions, but one sufficient guarantee—the Japanese Mint must submit to responsible foreign direction.

That such control can be exercised without impairment of national dignity and to the great enhancement of national credit and consequent commercial progress—with, as a corollary, large benefit to the governmental treasury, has lately been conclusively proved in more than one instance. England and France insisted on a Foreign Inspectorate of the Chinese Customs, to secure the payment of the indemnity after the last Chinese war. The indemnity was soon paid, but the Chinese Government found it greatly to its interest to perpetuate the system, and not only has trade flourished under it, but the Customs afford now a valuable security, upon which loans can be raised on easy terms, and their proceeds, in the present desperate state of internal revenue, furnish the tottering dynasty with its chief, almost its only pecuniary support. The example of Egypt will also at once suggest itself, and to revert to Japan, we have only to turn back a few pages of the history of the Osaka Mint, to find full assurance of the correctness of our view. The Mint was opened in the spring of 1871, and its productions, sent for inspection to America and England favourably reported on. Slight corrections of details, which experience had shown to be necessary were then made, and the report from the Royal Mint of England on the second edition of the coin being still more favourable,—the results of assay being characterised by the Mint-Master as 'eminently satisfactory,'—the first attack was made upon the Mexican Dollar. In the Oriental Bank Corporation, then acting as the Agents of the Imperial Government for supply of bullion, machinery, and other material for the Mint, the Government had a most powerful ally. It became generally known that the Director of the Mint and his foreign staff received their appointments from, and were held responsible to, the Bank; and thus the guarantee of the Corporation was given to the mercantile communities of China and Japan, that the coin issued by the Japanese Government was, actually, what it was nominally. In 1874, at Singapore, Canton and Foo-chow, the Japanese *yen* was made a legal tender, concurrently with the Mexican Dollar, and though the Chamber of Commerce of Hongkong was not then satisfied as to the stability of the Japanese Government, and hesitated, in consequence, to encourage its introduction into the Colony, there can be no doubt whatever that,—had this Government persevered for a very short time longer, retaining the services of the Oriental Bank as Agents, and vesting in their hands the appointment of a foreign Mint Master—the *yen* would have now been firmly established in China, and the Mexican Dollar would have been fast going out of use. For the whole foreign trade of China suffers a tax, which we do not think we overstate in putting at one-and-a-half per cent, paid to Chinese shroffs for their manipulation of the medium of exchange. With a new coin, stable in standard and weight, the product of a single Mint, under irreproachable foreign direction, and guaran-

teed by a responsible foreign Bank; the tyranny of the servant might have been resisted by the master. The coinage of Mexico necessarily varies; being the product of a number of mints, all working on the bullion from different mines, with machinery of varying excellence, independent of each other, and without any such advantages as those enjoyed by the Osaka establishment,—a foreign directorate, and a foreign guarantee. The competition between the several Mexican mints naturally keeps the coin up to standard, but the slight differences between their products gives an almost legitimate excuse to the Chinese shroff to put upon them a discriminating value, and foreign merchants in China would gladly seize the opportunity of abolishing this, in favour of a standard coin turned out from one guaranteed source. That this feeling has been lately gaining strength is evidenced by the repeated petitions from the foreign merchants in China to the Colonial and Home Governments for a British coined dollar, and by their frank acknowledgment of their error in declining to bear, long enough for the experiment, the cost of the British Mint that was established for a short period in Hongkong. Quite a serious agitation is now, we see, on foot, for its re-establishment, and should the Japanese Government fail to interfere, immediately, with an offer to coin for the China trade—there seems little doubt that this agitation will be successful; a British Mint will be established in Hongkong, and Japan's opportunity will be lost for ever.

Into the details of the arrangements necessary we need not enter very fully. Foreign countries have to pay China for the excess of her exports which they consume, over their imports which she will receive; and that balance must be paid in silver. At present it is paid mainly in Mexican silver, in the form of the Mexican dollar, which has to carry the additional expenses of a very heavy excise duty—which the Mexican Government imposes on the mints—and of the charges of carrying it from Mexico to her customers—say, for example, in London—and from London to China. It does not require elaborate argument or tabular statements to prove that it would be cheaper for Europe to buy bar-silver from the mines of California or Nevada, and pass it on, through the Japanese Mint, to its destination in China. The China trade would get cheaper money and the exchanges would immediately find their levels. What the Japanese Government has to concern itself with is the means to be used to secure the co-operation of the foreign Banks and merchants in China, or to justify the Governor of Hongkong and the English Colonial office in replying to the demand of Hongkong merchants for a Mint of their own, by telling them to avail themselves of that already established in Japan. And we can see but one way to achieve this, that which we have stated,—restoring the foreign directorate. The foreign Director need not positively be an Englishman, but the Japanese Government could not possibly do better, and might easily do worse, than ask the British Government to send out an officer from the Royal Mint, or a man of equal standing and repute. It may be argued by Japanese statesmen, or argued for them by foreign writers who stoop to beslave them with the flattery of venal pens, that the experience of the last three years has shown that the Mint can be worked efficiently, and the standard of the coin kept up, without a foreign Director, and under a native Imperial Commissioner, assisted only by the few able foreign superintendents of Departments still employed. We admit the fact, but deny the inference. The question is not what has been done, but what do foreign Governments—the Colonial Government of Hongkong for example—and what do foreign merchants, require? They may be obstinate, and unjust, and in every way wrong. They ought, we may grant, to be content with the periodical 'trials of the pyx,' and with the assay-reports

from American and English Mints; with the independent assays procured by the foreign banks on the parcels of coin they occasionally export; and with the belief that self-interest will ensure in Japan, as it has pretty well in Mexico, permanency of standard and continuity of supply. But suppose all this will not content them? And as a matter of fact we know that it will not. Are Japanese statesmen to be so foolish, as to throw away a manifest and great advantage, for the satisfaction of a petty punctilio of national pride? The time will come, they may confidently hope—after some years of experience of their honesty and appreciation of its being the best policy, when such guarantees as foreigners demand may be dispensed with; but securities must be given now, if Japan is to gain her end. And of these, perhaps the most important is that the arrangements made at first will be permanent for some fixed period of reasonable duration. We must be assured against any such capricious changes as caused the failure of Japan's first experiment in this direction; for one of the consequences of success will be to deprive us of a medium of exchange only inferior in degree to that which we wish to see established; and we have a right to demand that we shall not be made the victims of the national vices of instability of purpose and love of change, by any more excursions in the direction of bi-metallism or coinage of dollars of eccentric weight. Against this danger we must be protected by the foreign staff being engaged for at least ten years.

The question remains for discussion whether any special inducement need be held out to foreign Banks, to secure their good will and support to the change we propose—the substitution of the Japanese *yen* for the Mexican and every other dollar, and its establishment as the sole medium of exchange in the trade of the Far East. After giving very careful consideration to the matter, we have come to the conclusion that their support will be given without it. When the *yen* made its first appearance in China, under the protecting shield of the Oriental Bank's guarantee, that help was invaluable to it and at once secured it a good foothold. But should this Government now seek to gain other than disinterested assistance from this powerful Corporation, by—for instance—offering to make it its sole agent for the importation of bullion and mint *material*, and by vesting in it the appointment of the foreign Director and his staff;—there is grave reason to fear that the Bank's rivals might be incited to opposition to the *yen*. For such an agreement, with the early and exclusive information respecting the Mint's proceedings which would accrue to it, would go far towards giving the Oriental Bank the control of the China exchanges; and greatly as we respect this venerable Corporation, we are by no means prepared to to advocate processes tending to that end. A syndicate of the foreign Banks, guaranteeing the coin and responsible for the foreign staff, will doubtless suggest itself to some minds as completely meeting the case; but we cannot find reasons to justify us in hoping that such a combination is practicable. And if—as we suggest—the British Government will undertake to appoint a Director, we think that his verifications of the local assays, and the half-yearly reports from English and American Mint-masters, ought to, and will, satisfy the Hongkong Chamber of Commerce. The Japanese Finance Minister should therefore open negotiations with Sir Harry Parkes and Mr. Pope Hennessey, and gain their good offices with the Home Government with the least possible delay. Nor should he fail to secure, also, the valuable co-operation of the Chinese Minister. It is true that already is the Japanese dollar a legal tender at Canton and Foochow; but its position would be greatly strengthened, were its *status* to be proclaimed by the Chinese Government as equal to that of its Mexican rival, at all the ports of China open to foreign trade, concurrently with the announcement of its acceptance by the English mercantile community of Hongkong.

The extreme length to which has extended this division of our subject compels us to defer, to some future occasion, consideration of minor points of only less importance:—such as the guarantees for assurance that sufficient coin shall always be forthcoming for both the Japan and China trades, perhaps the most difficult part of the task before the Japanese Government; the amount of seigniorage to be charged on coining for the public; the subsidiary coinage, its profits and its standard; the currency of Mint warrants, or certificates;—and, generally, the direct and collateral benefits to Japan consequent on the expulsion of the Mexican dollar. But we have raised the standard of the crusade against it, and shall await some evidence of our having gained a following, before we proceed to undertake labour, whose weight is manifest, but whose reward is uncertain.

FORE-SHORE RECLAMATION. II.

IN continuation of our article of last week upon this subject, we have to remind the reader that we described to him the construction of the vegetable mattress called a 'zinkstuk' by Dutch engineers, and showed how it was built up of 'fascines' and 'wieps,' strengthened and moored by stakes and piles. This apparatus we have now to apply, and must recall to our readers' memory the diagram of a flat-fish's skeleton, which we took as a popular figure of our plan, the backbone representing the course of the stream, and our intended projection of that course, along which we propose to establish artificial banks.

This the 'zinkstuks,' loaded with stone ballast, and submerged below low water mark, at once commence to do for us and, as we have said, judgment has to be displayed in selecting the positions in which they are sunk: the objects which we have in view being duly regarded—the shaping of the channel, by means of these submerged guiding banks, in such a way as to give us the *maximum* of scour, and as a consequence, the *minimum* of bar at the new mouth of the river. It will be at once evident that—referring to our diagram,—the proper place for these engines of obstruction is on either side of the backbone, between the side-bones or ribs. At the junctions of these with the *vertebrae*, are placed 'groynes,' the parts actually abutting on the channel being technically called the 'aprons' thereof. These are formed of combinations of piles or stakes, supporting fascines interwoven with 'wieps,' duly filled and weighted, as described in the construction of the 'zinkstuk.' They are built up to the level of an ordinary spring tide. As the 'groynes' recede from the 'aprons,' they trend away along the lines of the side-bones of the skeleton, diminishing as they go, until they dwindle to mere staked-down 'wieps,' and finally end in a ramification of silt-catching brush, which only needs to be planted on the higher portions of the sand or mud banks, which invariably dry at low water. Thus is formed one of the ribs of our imaginary skeleton, and the whole diagram having been filled up in the same way, we commence to watch its action upon the tides and currents. This we will proceed to describe.

Let us first pursue one single tide from flood to ebb. As the young flood sets in, the waters of the river are banked up in their shallow channel, and forced over the adjoining mud banks. But here they meet the obstructions we have laid down, our groynes along the ribs of the fish's skeleton. These guide and break them up, till their lateral motion is so dispersed that it practically ceases, and as a consequence, whatever the waters held in suspension is deposited upon the flats. Meanwhile, the flood continues to bore its way up the channel, giving off always some portion of its volume as we have described, until the point is reached where it ceases to overcome the resistance of the down-pouring stream; when ebb begins. But the

ebb has meanwhile already set in on the foreshore, and at the outfall of the river, and as the receding tide-wave hurries back from the channel's mouth, the hitherto convex surface of the flood becomes concave, and, drawing laterally, it sucks a portion of the now comparatively limpid water from the adjoining mud banks, which are thus left by each recurring tide increased all round, and with surfaces slightly higher. Meanwhile the stream, reinforced by these side-waters, passes between the 'zinkstuks' which guard the bases of the banks from its erosion, scours the bottom of the channel and finally the bar, removing the deposit of the previous flood tide and carrying it into the deeper water beyond.

At first sight it would seem that, when the flood came back, it would efface the result of the ebb, by again depositing silt. But it must be considered that the ebb flows faster and with greater volume than the flood. In the first place, the flood is moving up against the descending stream, and its force is therefore *x minus* the force of the river; secondly, as we have shown, the water being banked up in the channel with a convex surface, runs over laterally and the force of the flood is thus constantly dissipated. The ebb, on the contrary, runs in the same direction as the stream, and its force may be figured as *x plus* the force of the river. In addition to this, as we have shown, the concave ebb tide, sucking back to assist it the water from the flats, acquires so much greater force than the flood had possessed, that it not only removes the silt which the latter had deposited, but, in the channel formed by the sunken 'zinkstuks' cuts out and deepens the river's bed. And now, at last, we are able to give the final proof of the correctness of our view, that the upper and middle sections of rivers must take precedence of the lower in any attempt to improve or 'rebuild' them; for it is evident that, if the stream is allowed to bring down with it a quantity of lithic matter which, added to the silt brought in by the flood-tide, together more than equals that scoured out by the ebb, we shall have been 'pottering about the mouth' to no purpose, and the bar will increase instead of diminish. Whereas, if the upper portions of the stream have been properly cared for, the flow of the river guided and regulated, and the banks properly protected from erosion, the ebb will be composed of comparatively limpid water only, and the bar will be gradually dredged away, or rather pushed forward into deeper water, where it will cease to be an impediment to navigation; while gradually, on either side of the improved and prolonged river channel, the forces of the tide and the river together will themselves reclaim, or rather create, the fore-shore.

This appears a very simple matter, but simplicity is the main characteristic of every valuable idea; and we are surely justified in our statement, made in a former part of this essay, that the value of the land thus reclaimed would far more than balance the cost of reclamation. But we must not forget the other object we have in view, the formation of a port. For "time is money" and if the factor, "wind and weather permitting," could be expunged from the calculations of merchants and ship-owners, how much time would be saved, how much money made, in the transaction of the shipping business which now has to be done in the exposed, unsafe, and inconvenient roadstead of Shinagawa.

Leaving therefore, time and tide to do their work upon the framework of artificial obstructions we have prepared; to clothe our skeleton of 'zinkstuks' and 'fascines'; we proceed to prepare the plan of the future harbour. Sweeping round, from the right bank of the river at Tsukidji, and following high water mark, we find ourselves,—speaking roughly—tracing an arc the outer horn of which rests on Shinagawa. What we have now to do is to prolong this arc, slightly contracting its radius, so that its terminal point may strike the line of our prolonged river channel on

the extreme edge of the banks to seaward. The river channel would then form the chord of this bow.

To do this, an embankment and sea-wall would be necessary, extending from the Shinagawa shore in the direction required. So far as this extends over the shallows, it would be utilized, both as causeway and breakwater; but after leaving the shoal waters, it would become the defence of the harbour which we propose to construct behind it. And this, doubtless, would be an important and somewhat expensive work. But by good fortune, in the obsolete and useless forts we have much of the material necessary, and in the small piece of work just finished on the eastern side of the mouth of the creek at the end of the Bund of Yokohama we have a proof that the work can be efficiently done by native labour, skilfully directed, and without the aid of much expensive imported material, such as Portland cement;—for the engineer who has constructed this wall has succeeded in combining Japanese material into a satisfactory substitute. And—a most important point—this work also furnishes a perfect gauge of cost. The forts would furnish the facing stone, their *debris* fillings, and, supplementing this material with concrete, or *beton*, blocks—made, as in Captain Bridgford's wall, of native material, the expense of this breakwater ought not greatly to diminish the balance which would accrue to the Government, after restoring the river and opening its mouth, from the sale of the reclaimed land.

Within this wall, of course, it is probable that some excavation might be necessary, and the work ought to be carried out simultaneously with the reclamation of the whole fore-shore; but this is a matter of detail the execution of which requires proper survey of the locality. Our object is merely to outline and suggest what may be done, not to tender for the contract. We therefore pretermit description of the wharves projecting from the inner side of the wall, alongside which ships would lie, discharging or loading into or from wagons or lighters, as best suited the shipper or the consignee; of the docks, dry and wet, for repairing vessels; of all the other adjuncts of a great port. It appears to us that an opportunity offers here, of getting great advantage for small outlay, and if our thus directing attention to the matter has as good a practical effect as was produced by the first articles of this series—respecting the treatment of the forests of Japan,—we shall think ourselves amply repaid for our trouble in collecting the facts we have assembled, and putting them before the public in—we hope—an intelligible form.

THE following important Notification, issued on the 30th ultimo, reaches us too late for us to do more than give it publication and cursory notice:—

NOTIFICATION No. 7.

Notice is hereby given that a decree has been issued for the raising of a loan of Twelve millions-and-a-half of *yen* by subscriptions of the people, to pay for public works and subsidies to national industries within the Empire, thereby increasing native and foreign trade. The Minister of Finance has been ordered to execute this decree, and will publish further information shortly.

Tokio, 30th day 4th month, 10th year of Meiji,—(April 30th 1878.)

(Signed) SANJO SANETOSHI,
Daijo Daijin.

We await with curiosity the 'further information,' until receipt of which comment is almost idle. The step is a bold one: that the Government could have raised another foreign loan without much difficulty, we have little doubt; if the proceeds were to be devoted to such useful public works as construction of roads, restoration of rivers, afforestation, and improvements to harbours,—and if the money was to be spent under honest and intelligent foreign con-

trol—we should have no doubt at all, and could have assured cheap money. But an internal loan is a different matter. It is a test of the feelings of the people towards their rulers; and confidence in the existing Cabinet, loyalty to the present occupant of the throne cannot better be shown than by an immediate and overflowing subscription. We very cordially wish that success may justify the Government's courageous appeal to the people.

WE beg to call special attention to a passage in the article which we quote from *The Times*, on the case of *De Bussche v. Alt*, which should not be allowed to pass into record against this trade, without protest and denial. Agreeing most fully with the view taken by the great London newspaper of Mr. Alt's behaviour as an agent, we must give emphatic contradiction to the imputation conveyed in the following sentences:—

"Mr. Alt set up a custom of European merchants in Japanese ports, by which they claim freedom to throw off the character of agents whenever they think it profitable to themselves. They are acting for the owner of property when it will fetch no more than the minimum price; they are acting for themselves when they can get something beyond that price. Lord Justice THESIGER even had to admit that evidence of the existence of such a custom had been produced. Yet it is obvious that its direct effect must be to sap the very foundation of the good faith on which the relation of principal and agent rests. A principal's chance of profiting by the ability and activity of this agent is but slender when the agent, if he finds that by ability and activity he may make a better bargain, is free to buy at the lowest and sell at the highest. There is the comfort that a practice so immoral is 'scotched' the moment it comes within reach of an English Court of Justice."

But our contradiction is merely made for our own satisfaction, and is little likely to reach *The Times*. It appears to us a clear duty of the Chamber of Commerce to take up the matter officially, and give the statement official denial.

THE important news that the negotiations for the simultaneous withdrawal of the English and Russian forces have failed was circulated last night by Reuter's Agency, and we cannot but agree with the Russian press in considering war between England and Russia inevitable. But that Russia can prolong hostilities without national bankruptcy, and that England is quite unready for war are both important factors in any calculation on the subject. They have hitherto prevented the collision, and may continue to do so for some time longer; but our countrymen at home appear to be on the verge of one of those bursts of passion which have more than once forced unwilling leaders to obey the national will, in defiance of prudential considerations and irrespective of all feeling but one—to avert a stain upon the nation's honour.

[ERRATUM. In our last appears a misprint which will of course have been recognized as such by our readers interested in silk, but which we may as well correct. On page 141, first column, near the foot, 130,000 is stated as the number of silk egg cards to be made this year. It should manifestly have been printed 1,300,000.]

PAPERS OF THE GERMAN ASIATIC SOCIETY.

THE UJI*; BY G. A. GREEVEN.

IN consequence of repeated annual observations, I am now in a position to confirm and enlarge the few remarks of mine on the 'Uji' which are published in the seventh number of these Transactions. I shall explain the whole life of the insect here, so that a knowledge of my first ac-

* By the term "Uji" the Japanese understand many kinds of Larvæ and Worms, especially when they live in putrefying matter or derive their sustenance therefrom. I use the simple word "Uji" specially for these small parasites which feed themselves chiefly on the bodies of the silk worm, because these are the most important, and are almost the only ones known under this name to the Europeans settled here.

count will be superfluous, and I shall therefore commence with the complete and perfect fly itself.

It measures between thirteen and fifteen m/m in length; the head of the male is of a bright yellow colour, that of the female still brighter; the back is grayish black, the legs and feelers black; the hinder parts of the body are of a transparent brown colour with black stripes in the male, and of a grayish colour in the female.

It appears in the largest numbers in the end of April and beginning of May, and this holds true for Yedo and the neighbourhood as well for the province of Joshu. The first comers are mostly males, the females coming somewhat later. On the other hand, the number of the males is less than that of the females in the end of May, and in the beginning of June even these latter become rare. In the beginning of May, and especially in the forenoons, one sees these flies, in pairs as a general rule, on isolated, projecting old mulberry trees and in great numbers on the edge of running water; they fly to and from the ground, seeking for their food between fallen leaves, dung &c. In the middle of the month and still later they are most numerous in the larger mulberry plantations, and almost always on the sunny side of the fresh sappy leaves. As already mentioned they are at this time almost wholly females, who fly briskly from leaf to leaf, disappearing now and again under a leaf, and depositing, or rather stripping off, an egg on the back. The consequence of this stripping off is that the eggs are chiefly to be found on the ribs of the leaves, or frequently half under them, and hidden in the filaments. The fly lays only one egg each time, and then betakes itself to another leaf.

The egg is covered with a moist glutinous substance, and as this dries rapidly, the egg is fixed pretty firmly, and cannot be removed without some difficulty.

Unfortunately for the silk growers, the egg is very small, and escapes all but the most careful attention. Its average length is about 1/5 m/m, and its thickness but 1/9 m/m, so that it looks to inexperienced eyes like a small black spot which might be mistaken for many other black spots. Under the microscope it is of a dark brown colour, feebly bright, and oval.

The external covering consists of pentagonal cells, which gives the egg the appearance of being covered with a net. It is soft and tough rather than hard and brittle. Moreover the young fly which forms the substance of the egg is covered with a double skin which looks colourless, and is extremely tender and transparent, and which by a slight but regular friction comes out of the egg with the Uji through a fissure.

Whether the fresh laid eggs contain living Ujis, or whether a certain time is necessary for their full development, is a question yet to be decided, and with it the period which is most dangerous for the silk-grower will be fixed more accurately. On the other hand, I have found fresh and living flies in eggs which were twenty, and perhaps more, days old.

My experiments have now shown me that the hatching of the Uji takes place in the stomach of the caterpillar, and that it immediately forces its way through the membrane of the stomach, and makes a path for itself to a Stigma. I will not absolutely set aside my previous conjecture that that penetration takes place from outside through one of the Stigmata; but this occurs rarely, and according to my theory of the hatching of the egg, only when the latter is placed in moist, putrefying matter, which can only occur with careless and dirty breeders. In all the cases observed by me, I can come to a conclusion about the hatching in the stomach; and in experiments which I have made with a large number of fresh eggs which were eaten by caterpillars, I could only find the empty shells in their stomachs.

The smallest Uji corresponds completely in its structure with the larger ones known to every breeder, and exhibits the two air holes at the back as well as the two claws in the front part of its body. It is almost entirely transparent, and one can clearly perceive the internal organs. On account of its diminutive size and its fineness, observations can not be made with the naked eye; for accurate investigations it must be increased to two hundred times its original size.

The small Uji fixes itself in the entry behind a stigma, the head through an opening in the wall of the entry in the fatty part of the body of the caterpillar, and finding nourishment there, while it breathes through the stigma of the caterpillar. It remains in this position until it creeps out of the body of the dead caterpillar or chrysalis, and grows one may say, from the beginning slowly in the body of the caterpillar. On

account of this growth the sides of the entry assume a black' rotten appearance. The trachea which belong to this entry and proceed from it also become black at short distances, shrink and look like dead branches. Should the covering of the entry, during the growth, come in contact with the skin of the caterpillar, it will at once occasion an external dark spot. Sometimes one finds a single large spot, sometimes two or three, and also a circle of small ones around the stigma. By these spots one may be sure of the presence of an Uji inside; but it is not the case that spots are to be seen whenever an Uji is there; for these spots are formed only after the Uji has been there a certain time, and it is to be remembered that the Uji for the most part does not penetrate long before the spinning of the Cocoon. It is also clear that as soon as the Uji deposits the egg in the stomach, it betakes itself to another stigma, because it is usually to be found on one of the front stigma. Up to this it has been thought that one caterpillar seldom contains more than one Uji, but this occurs very frequently. If three or more force their way in, the caterpillar will certainly die without spinning; but when only one enters, the caterpillar is transformed into a chrysalis which then dies. It also happens frequently that the caterpillar is able to spin the cocoon, but can no longer change itself into a chrysalis. Soon after the spinning the Uji leaves the dead chrysalis, and breaks through the cocoon; the hole which it makes, and through which it must force itself is remarkably small,—from two to three m/m in diameter. The cocoon of course is worth just as much or as little, as if it had been pierced by the butterfly, but the silkwormer who has raised it for the purpose of obtaining silkworms' eggs has nearly received the reward of his labour and trouble.

But I may observe here that this case illustrates only one part of the damage done by the Uji. Another injury which has not attracted so much remark, is the diminution in the quantity of silk produced by silk worms containing the Uji, because they are necessarily weakened by these parasites. But as the chrysalis might soon die in the cocoon, and the latter be spun, the grower usually knows nothing of this evil, and notices only the cocoons which the Uji have pierced. I have very frequently found silkworms enfeebled with Uji, who waste a great quantity of silk, commencing to spin here and there, and finally producing only a very thin cocoon. I believe that the loss in silk in this manner considerably exceeds the loss occasioned by the piercing of the cocoons.

After hatching, the larvæ are from 15 to 22 m/m in length and from 5 to 6 m/m in thickness. They have no legs, and in the beginning are of a clear and almost transparent white colour; they crawl about in a lively manner, supporting themselves on the head and back part of the body, contracting and expanding the body and trying to reach the ground, where they hide themselves immediately. There in the space of twelve hours the larva transforms itself, by hardening the outer skin, into a barrel-shaped chrysalis, of about 13 m/m in length and 6 m/m in thickness, and passes the winter in this condition. Even though an Uji cannot hide itself, the transformation into a chrysalis still occurs, whether it is placed on wood, paper or in a glass. It will not hide itself in dry, sandy places, but shrinks up and dies.

As remarked already, in the spring, about the end of April and the beginning of May, a fly escapes from the chrysalis, which develops wings after remaining quietly on the ground for one or two hours; but it remains still longer in the place before it tries its first flight, and during this time it can be caught easily. When it is completely developed, it seeks for some place where it can conveniently live, and thus the circuit, briefly described in these lines, is completed.

One may gather from the preceding description of the development of the Uji, the best means of preventing the damage which it occasions to silk culture, but I am persuaded that the complete exclusion of the Uji from silk-culture is an impossibility; on the other hand, however, the damage which the Uji yearly occasions is so great, that one hears with pleasure that a part exclusion is possible. I may be allowed to mention here some conclusions at which I have arrived, and which I have submitted to the Department of Silk culture in Tokio for further examination. I must leave to practical Silk growers the question as to how far I am correct, and whether my propositions are practicable or not; but of this I feel sure, that from a knowledge of the development of the Uji, and the speculations based thereon, some means of partly abating this evil will be found in a short time.

As already mentioned, the fly likes warm and moist places near rich or swampy land; plantations on good, dry fields are seldom chosen, especially if they are in an airy situation, and these on sandy or gravelly soil are almost wholly exempt from it. Herein lies one of the most important rules for the laying out of new mulberry plantations. Moreover, feeding the silkworm with the leaves of plants grown on sandy soil protects it to a certain extent, but it is not to be expected that all growers are in a position to obtain the necessary quantity of such leaves. It is possible however, if the grower knows the "dangerous period" for his district; because he can then feed them before and after this period with leaves from the moistest places, and need only supply them with leaves from sandy or gravelly soil during this time.

If such land is not in the neighbourhood, but, for instance, spongy soil, it is then to be remembered that the fly likes the leaves exposed to the sun, and lays its eggs on them; hence, in a thick plantation of mulberry trees, those on the edges, and especially those on projecting branches within the plantation, should be regarded as dangerous, and should not be used for food. These may be regarded as so much protection for the rest of the plantation. Isolated rows of trees, such as one sees almost everywhere in wheat and paddy fields, are without exception sought by the fly, if they are on good soil, and in the neighbourhood of mulberry trees standing on moist ground.

The leaves of such trees should only be used before and after the dangerous period. For the cultivation of eggs, only the leaves of trees which grow in sandy or gravelly soil, and in airy situations should be employed.

It is also desirable to accelerate early breedings by artificial warmth, which in a climate like Japan is not very expensive; but this requires great care and constant regulating. On the other hand, there is very little to be feared from the Uji, because they can be destroyed when the eggs begin to grow numerous.

In order however, to make correct use of this hint, it is necessary above all to know correctly the time when the eggs are deposited in the various districts, and to ascertain the same for each exceptional spring. This is not very difficult, as it only requires a knowledge of the insect, and the possession of a good microscope. It would also be necessary to ascertain the time that the Uji is alive in the eggs; and I have good reason for believing that this does not extend into the month of July.

I may mention here that I have tried without success to remove the eggs from the leaves by washing them off. It was of as little use to immerse the leaves in cold water for several hours, and then to dry them. An Uji egg which had been placed in water for twelve hours, and subsequently remained for fourteen days on a withered leaf, exhibited a living Uji when crushed under the microscope.

The peculiar circumstance that plantations on sandy soil are more or less avoided, if they are not too near mulberry trees on moist ground, is chiefly due to the circumstance that the Uji is not fond of migrating. The greater portion of the Ujis comes from breeding places where they escape the attention of the grower and are able to hide in the ground, and to develop themselves quietly during the subsequent spring. They, as stated already, seek for a convenient and moist place in the neighbourhood, and hence it should be a rule to exert great care in catching the Uji when it creeps out of the cocoon, and it should be killed forthwith. In order to render a constant watch unnecessary, the entrance and exit of them must be prevented, and this can easily be done by putting a layer of sand on the ground where the mats which are covered with the cocoons lie, and by separating the same by means of a wooden frame which need stand only about 25 high m/m in front. In the spring also, the neighbourhood of the breeding places should be searched in order to catch all the flies at once. To be successful, this must be done as soon as is possible, because the flies generally spend but a few hours in one neighbourhood, and, as far as my experience goes they all creep out in good weather and within a few days. The flies should also be caught in the fields; and this, especially in the pairing season, can be easily managed by means of a butterfly net.

Few growers will avoid this trouble, which is comparatively little, when they hear that at a low estimate, one fly produces fifteen hundred eggs; and that under favourable circumstances, a small number is sufficient to ruin a whole breeding. I also think it well worth the trouble to see whether it is possible to prevent the flies living in mulberry

plantations by covering the ground with sand or gravel, or by planting some shrub between the mulberry trees which is in some way or other repulsive to the fly, and drives it away.

In conclusion; let me remind those who consider the labour of expelling the *Uji* too great, and who believe that the gains of the grower do not permit of the expenditure of more skill and labour, that the same reasons were urged in Europe against the application of the so-called cellular culture in order to get rid of the Pebrine, which requires much more care and time than the foregoing experiments, and that nevertheless it has been now generally adopted.

EDITORIAL NOTES.

WE MUST supplement our recommendation of the appointment of a responsible foreign Mint Master, the chief point insisted on in our leading article of to-day, by pointing out that the foreign superintendence of each important department of a Mint here is equally necessary. We cannot do this in terser language than that employed by Mr. Fremantle, the Deputy Master of the Royal Mint of London, in his valuable Report upon the institution under his charge published in *The Times* in 1871. Respecting the Chemical and Assay departments, Mr. Fremantle says:—

"In considering such questions it must always be borne in mind that the operations of minting consist not simply in the mechanical production of accurately adjusted discs of metal, the purity of which has alone to be guaranteed, but in the formation of an alloy composed of precious and base metals in definite proportions, and that not only does the preparation of such an alloy present many difficulties, but that the accuracy of its composition after melting must be absolutely ascertained, that it must be protected during certain processes incidental to coining against a change of standard, and that finally its correctness must again be verified when it has been converted into coin. It is evident, therefore, that it must always be an object of the first importance to a Mint Master to attain the highest possible degree of accuracy in the chemical operations connected with coinage, and more especially in assaying; and no opportunity has been neglected during the past year of applying to the practice of the Mint the experience of the past and the exactness which is the main characteristic of this branch of science at the present day."

That the Government appreciates the truth of this, appears from the fact that when it dispensed with the services of Major Kinder and the major portion of his staff, it retained two of the principal officers, calling them 'technical advisers' of the 'Commissioner.' The foreign mercantile public and foreign Governments have a right to demand that full assurance shall be given that these appointments are to be permanent for a reasonable term of years—and that the officers holding the appointments should be responsible to the foreign Mint Master. The large revenue which Japan will derive from her Mint, should the Government adopt our suggestions, and be successful in procuring the co-operation of the British Government, will reduce the cost of a foreign staff to a trifling percentage on their receipts. As, without a foreign staff to control its issue, their *yen* most certainly will not be made a legal tender in Hongkong; whereas Hongkong, failing some overture from the Japanese Government, will almost certainly decide this year to have a Mint of its own, the sooner the Government pockets its pride the better, that the country's treasury may the sooner be filled with something more substantial.

THE foreign journals of Japan are not alone in their condemnation of Iwasaki's incredible statement of the affairs of the Mitsu Bishi Company. Amongst other notices in the native press, we remark one in the *Hochi Shimbun*, in which the writer very quietly pricks the windbag of patriotism and care for the public welfare shown us by the Director. Public interests are all very well, says this writer, but the duty and business of a private company is to look after its own interests. These secured, the general public will benefit in consequence, but if these are neglected, in a pretended zeal for the public good, nobody benefits at all. As for the Mitsu Bishi Company's subordinate officers' reducing expenditure—the *Hochi Shimbun*

follows the lead of the local foreign press, pointing out that in a well regulated Company there is no unnecessary expenditure to curtail.

We are told, now, that the circular was never intended to be published: that it was only a circular letter printed by the Director as a caution merely to the Company's officers, and that much of the schedule of losses was mere Oriental hyperbole. We all know how, in describing a skirmish, a Japanese historian will tell us that the heavens were darkened by the flights of arrows, and that 'several tens of thousands' of men perished. It would appear that, adopting the historical style, Iwasaki,—when writing that the Shanghai line had lost 300,000 *yen*, only meant to say that the profits had not been so large as he expected them to be. To Western minds this seems an odd way of putting matters, but we suppose we must accept our error as another proof of the fact that the longer we live in Japan, the less accurate is our knowledge of the people and their ways. An offer to purchase a couple of steamers from the Company last week elicited the reply that they were all so fully engaged that none could be parted with; which agrees very badly with Iwasaki's statement that he cannot get freight.

THERE could not be a better proof of the value to the public of the labours of the German Asiatic Society (Der Deutschen Gesellschaft für Natur- und Völkerkunde Ostasien's) than the very interesting and exhaustive paper, by Mr. G. A. Greeven, on the '*Uji*,' a translation of which we give in other columns to-day. Mr. Adams, when writing on Silk Culture in 1870, had not the means at his disposal possessed by Mr. Greeven for studying the subject, and—minute though his description is, and in many respects accurate, it is not so full as our present author's, nor is it so reliable. Mr. Adams, for instance, adopts the theory that "the fly fastens on the young worm, and pricking it, deposits its egg or eggs (for there may be two or more) within the skin; that then, as in similar cases, adipose matter is formed round each egg; that when the egg is hatched, the maggot feeds upon this matter, and increasing in size, penetrates more and more into the intestines of the silkworm." This theory Mr. Greeven's microscopic investigations, his experiments, and observations in the silk districts completely destroy. M. Piquet made some experiments in 1873-4 which led him to the same conclusion, that Mr. Adams was wrong; but unfortunately he was not able to pursue his investigations further, so as to show, as Mr. Greeven does, how the egg is introduced into the intestines of the worm.

We are sure that those of our readers interested in silk culture or the silk trade, who are unable to read Mr. Greeven's very valuable paper in the original, will feel much indebted to him for the information it affords, now that it appears in an English dress; and our own thanks are due to the German Asiatic Society, who have so kindly responded to our offer to make this Review their medium of communication with the English public.

A CORRESPONDENT addresses to us the following letter:—

"To the Editor of the *Japan Times*."

"Dear Sir,

"Can anybody inform me whether there is any truth in the following rumour: The Railway Department intends to raise the through fare from Yokohama to Tokio, 2nd Class, to one *yen*, without increasing the fares between the intermediate stations. The Department will thereafter—in similarity to the recent Notification of the Telegraph authorities—make it a rule, that passengers from Yokohama, whose ultimate destination is Tokio, will henceforth not be allowed to take out tickets for intermediate stations, for instance Kanagawa, and after a short rest there, proceed to Tokio on fresh tickets bought at the Kanagawa Station. The Railway Department will force all such passengers to take out through tickets for Tokio at Yokohama, and will not permit them to leave their seats at Kanagawa. If anybody attempts to circumvent this regulation, by travelling on local tickets, he will be stopped at the first intermediate station, and sent back *in irons* to the Yokohama Station master.

"I am sure it will be of interest to others than myself to

learn whether the above arrangement is actually to be made."

It is a pity to know that there is but the slightest chance of our Japanese friends, either in the Press or the Government seeing the irony of this. It will probably be taken *au sérieux*. Our correspondent will remark that we have thought it prudent to withhold even his pseudonym.

WHEN, three months ago, our contemporary the *Japan Mail* took advantage of a misprint in our columns to read us a lecture on Latinity, we retorted by picking out half-a-dozen misprints from a dozen lines in a Floral Calendar of our rival's, from which we might with equal injustice have impugned that paper's authority on Botany. And we wrote: 'no book, no newspaper, no Review, is safe from misprints . . . they are even to be found in the leading columns of *The Times &c., &c.*' A singularly strong example is given us in the first page of the *Economist* of February 16th. In a most important article on 'The Bank Rate,' the writer has occasion to quote some evidence given by the Governor of Bank of England, Mr. James Morris, before a committee of the House of Lords in 1848; and makes him say: "I consider" were Mr. Morris's words, "that in London the discounts by other parties, the great discount brokers and The amount of bills under discount held by the Bank of England at the present date is not known &c., &c. The continuation of Mr. Morris's answer from the words 'brokers and'—viz. "bankers, must be equal to the amount which the Bank holds under discount"—do not appear until the reader turns the page, when he finds them on the top of it. Mr. Morris' answer thus was:—

"I consider that in London, the discounts by other parties, the great discount brokers and bankers, must be equal to the amount held under discount."

And the paragraph immediately succeeding this has got transposed from its proper place in the third page of the paper to the first. The whole argument is dislocated, and until the reader detects the errors, and replaces the transposed sentences to their right places, the article is nearly incomprehensible. And the most extraordinary part of the whole business is that the *Economist* does not think it worth while to correct the blunder in its issue of the following week.

WE have very carefully preserved the style of the original in the following extract from the *Thoya Shim-bun*, on the sadly-increasing extravagance and arrogance of the Japanese wife, since despotism was nominally abolished and civilization and constitutionalism, with their excrescences, 'woman's rights' among the number, came into fashion in Japan.

There seems to be no manner of doubt that contact with foreigners and the establishment of the native press are directly responsible for this new display of the 'detestable custom' of wives taking precedence of their husbands. How pathetic are the two pictures drawn by the writer. The poor coolie, after a long day's toil in a rice field, and dragging a *jirikisha*, returning home dead beat, and having fairly earned the right to a nice hot bath and a smoking bowl of rice—told by the virago 'that owns him' to draw the water and clean the rice before he puts his dirty feet on her clean mats:—and the scarcely less pathetic *tableau* of my lord coming home from a fatiguing Board to find my lady pouting and pettish, and requiring the excitement of a concert or a theatre to bring back a smile. and having to hurry into his dress suit, after a scamped, indigested dinner to accompany her. This sort of thing, we knew, happened in effete Western communities, where the 'joyous life' has been long extinct; it is something new to learn that, in Japan, civilization has made wives disagreeable and husbands unhappy. Yet this would seem to be the case from the following paragraphs:—

"Some time back arguments *pro* and *con*, on the question that men and women had equal rights, and should have equal privileges, used to occupy much space in our newspapers. But the discussion soon dropped, and we now hear nothing of it. But still we see in practice, in the country generally, that men have much greater power than women. On the other hand, however, there are many cases among the lower classes of the community, where the woman has greater power than the man. For

"instance, the husband goes out in the morning to his work, and after labouring all the day, comes home tired in the evening, when his wife gives him orders to 'draw water' or to 'clean the rice before you come in' or employs him, any how, in some fashion. And so women acquire a detestable pride as every one knows. Lately, moreover, we have discovered a similar practice existing amongst gentlemen of the higher classes. Is not this a strange thing? The gentleman goes out in the morning to his office, and having conducted it all day, comes home in the evening, when his wife says: 'To-morrow is a holiday, we will go to the theatre'—or 'I am very *ennuyés* this evening, we will go to some entertainment.' And the affairs of the whole house being under the control of the wife, the gentleman,—the husband—can do nothing as he wishes. Cases like this are numerous. Formerly, that the husband should not have the exclusive power of ruling all things in his own house, was the origin of the argument that men and women should have equal rights: how much more necessary is discussion, now that wives have grown so powerful! We have come to the conclusion that this is owing to the fact that not a few of our gentlemen take wives from the low class of singing-girls, &c., and these, after becoming wives, cannot forego the habits they were accustomed to in the time of their youth and during their education by their parents: and their husbands having originally taken them to wife, on account of deep affection for them, and after accustoming them to have large amounts of money spent upon them; thus the relation existing between them is far different from those who had married with due ceremony and proper go-betweens; and they are unable to correct any of their wives' defects, and so these detestable habits have originated. Such wives as these, women of no ability, only careful for luxurious food and fine clothing and not considering that they enjoy so happy a life only by the kindness of their husbands, become proud as mentioned above. This we deeply regret. But let us hope that these are things past, and that, through it may be difficult to get rid of such habits all at once—those who marry in future will not follow such courses as those we have indicated."

NOTES AND QUERIES.

QUERIES.

Qy. 6. Can any of your readers inform me whether there are any, and if so, what books on Japanese surgery, or midwifery, as practised before the coming of the Dutch and Portuguese? (Unanswered.) Z.

Qy. 8. Mr. Bramson's interesting note on the relative values of coins in your issue of February 23th, leads me to think that he or some one else may possibly be good enough to clear up a few points which have frequently occurred to me:—

1.—Can any one say when, and under what circumstances, paper money was first issued in Japan? "Shosei" in your issue of March 9th gave a most interesting account of the *Han* paper money; and perhaps if there were a general issue before that, some other student may be able to do the same for it.

3.—Can any account be got of the regulations (if any) which governed coining under the feudal system? For instance, under what circumstances was permission granted to certain individuals to strike coins? This seems to have been done at various parts of the country, thus we have Musashi Ichibu, Suruga Koban, &c. (Unanswered.) X.

Qy. 9. I want information as to the locality of the signature of the original Treaty with Japan by Commodore Perry. Treaty Point, a mile or so away from the town indicates the spot: but was the treaty signed there in the Temple at Homoko, near which the butcheries now stand; or was it under a group of trees which stood on the site of the present British Consulate? I have heard both places assigned as the scene of the transaction. (Unanswered.) B. A.

Qy. 10. Can any of your medical or other readers inform me of the recent existence of cases of poisoning resulting from the use of bread made from impure wheat; the symptoms being those described in works on Medical Jurisprudence, as arising from the presence of the *Lolium temulentum* or Darnel grass (or other poisonous *gramineæ*) viz; Gastro intestinal derangement, narcotism, vertigo and convulsions. (Unanswered.) R. N.

Qy. 11. Many of your readers, when walking towards the new cemetery, must have remarked the *tumuli*, about twelve in number, which dot the table land which lies above Ota on the one side, and the hill of Tobe on the other. These *tumuli* are religiously preserved from the spoiling of the farmer, and must have some history; are they the burying-places of heroes fallen in some old quarrel? Can any of your readers enlighten me? (Unanswered.) T.

NOTICE TO CORRESPONDENTS.

No notice will be taken of anonymous correspondence. Whatever is intended for insertion in the JAPAN TIMES must be authenticated by the name and address of the writer, not for publication, but as a guarantee of good faith.

Manuscripts found unsuitable for our columns will be carefully returned to the writers.

YOKOHAMA: SATURDAY, MAY 4, 1878.

NOTES OF THE WEEK.

FRIDAY EVENING, May 3rd.

THE *Malacca*, bringing the English mail of the 15th of March, arrived in harbour on Tuesday last. The *City of Peking*, on the same day, returned to port in consequence of an accident to her machinery. The *Tanais* left with the French mail on Wednesday, due in London June 24th. The English mail leaves on the 5th inst. due in London July 1st. We are sorry to say that she will take, as a passenger, the most deservedly popular Agent of the P. & O. Company, Mr. G. Bickett, Junr. He has well earned his leave by long and arduous service—but none the less shall we be glad to welcome his return. We have no other mail intelligence of importance to report. The weekly Shanghai and coast ports mails have arrived and departed.

The accident to the *Peking's* engines is hardly susceptible of a 'popular' explanation: because, when one says that her next to aftermost crank-pin gave way, and that the difficulty of repair consists in extracting those parts on to which the cranks are shrunk, one's fair reader asks 'what is a crank-pin?' and there you are—reduced to first principles. But experts will appreciate the magnitude of the disaster which might have occurred, had the conditions under which the accident happened been less favourable. Occurring to the last crank but one of the four, instead of to the last, as might have been; and happening when the ship was near port, instead of in mid-ocean, the engines were not entirely disabled, and the vessel was able to make her harbour. Again, the crank-pin did not give way with a clean break, but was only fractured and bent. Another most fortunate circumstance was that there happened to be here in store a spare 'beam-setter'—the pin on which the 'walking-beam' with which we are all familiar in another class of engine, works—and but little work on this was requisite to make it into a new crank-pin for the *Peking*. And again a great piece of luck, the broken pin was got out of place with unexpected ease. The Company is therefore to be congratulated on so fortunate an escape from what might have been a serious disaster. We pass to other topics.

About the most significant telegram we have had for a long time from England is that announcing that eight thousand Volunteers have come forward as the nucleus of an entirely new corps. How much this tells us! Of the heart of a people beating with one desire—"of our land

"that has lost for a little her lust of gold,
And love of peace that was full of wrongs and snarles;"

of the gilded youth of England yearning to show that the true metal is not all on the surface, that the old spirit that animated our ancestors asks for nothing but opportunity to fan it into flame. Better backing this, for a Minister preferring war to a suspicion of dishonour, than perfunctory votes of confidence from obedient majorities in Lords or Commons: better evidence of the nation's support than millions of money granted to his Chancellor of the

Exchequer;—and, we believe cordially, more potent to curb an ambitious opponent's advance than the movements of a fleet or the despatches of an ambassador. Beyond this, nothing of great importance has been brought to us by the wire.

Turning to our local news, we are glad to put on record the acquittal from blame of the Captain of the *Fire Queen*, whose total loss in Sendai Bay we mentioned last month; the finding of the Court of Enquiry being that "the loss of the ship is another illustration of the unreliable nature of the currents on the coast of Japan." Extraordinary country:—last week the Director of its national mail line publishes a report of which nobody can believe a word; its currency is most unreliable paper, and now it appears that even the currents on the coast are not to be depended on!

Punch has made a prompt appearance this month, but the number is far from being so good as the last. Homer, however; we know, sometimes nods, and the conductor of a local weekly invariably (if our local caricaturist is to be believed,) goes to sleep on Sunday afternoons in the Club: so Punch must occasionally be allowed to take a holiday, and give us a dull number. How dreadfully the London comic journal has fallen off of late, by the way. An editor of such a periodical ought never to have such decided views on politics as are now advocated at 85, Fleet Street. Shirley Brooks' mantle has by no means fallen on his successor, and the Essence of Parliament has lost its delicate fragrance, and induces, instead of dissipating, weariness. *Appropos*, what very uncomfortable chairs those are in the Club, to go to sleep in!

Punch's criticism of *Trial by Jury* is one of the best that has appeared: how thoroughly everyone endorses his aspiration that it may soon be played again. But we fear this is hardly likely, Dave Carson is announced, however, to be on his way hither, and as his *troupe* will probably appear on the evenings of a couple of the Race days, he will have, at all events, a lively audience, though perhaps not so large as he might wish; since so many residents are going to avail themselves of the race holidays to make rather prolonged trips into the country. One is inclined to doubt whether they are not right. The first meeting of the new Race Club promises to be a very interesting one; but Japan is at her loveliest now that Spring is dancing out so joyously on her thousand hills and vales, and the scarlet and green of her dress of azalea and maple and tender young foliage is a prettier combination than any of the colours of our gentlemen jocks. Happily our race-course, surely the most beautifully situated in the world, gives us somewhat of both pleasures, though we must miss the restful calm of the forest, and exchange for the noise of the packlock and the ring, the throistle's note, and the babble of the brook.

Which reminds us that we must not omit to thank our contemporary the *Herald*, for a copy of the very neatly printed and conveniently arranged Race-book. This is quite a little volume, giving us, besides the *menu* of various "Plates" and "Cups" space also for recording purchases at Sweeps and Lotteries and lists of winners of the principal races since 1867. What pleasant memories these lists recall, but what sad thoughts, too, of dead or vanished friends! But it will never do to be sentimental on the eve of a Race-Week. Rather, to be in the fashion, let us venture on Prophecies, not indulge in Lamentations,

FIRST DAY.

Trial Plate. *Gone Away* 1. *Velocity* 2. *Brown Satin* or *Vanguard* 3.
Griffins' Plate. *Admiral Rous* (in a canter) 1. *Kiazoku* (with a start) 2. *Vampire* or *Sat. Elm* 3.
Celestial Cup. *Dibs* 1. *Lintie* 2. *Chief Mongolian* 3.
Bankers' Cup. *Allendale* 1. *Telephone* 2.
Ten Cup. *Admiral Rous* 1. *Petrol* 2. *King All Francis* 3.
Professional Cup. *Bonny Doon* 1. *Braemar* 2. *Sport* 3.
Mitsu Bishi Challenge Cup. *Kangaroo* 1. *Annandale* 2. *Distemper* 3.
Consular Cup. *Dibs* 1. *Lintie* 2. *Chance* or *Crusader* 3.
Ito Cup. *Oyama* 1. *Annandale* 2. *King All Francis* 3.

SECOND DAY.

Community Cup. *Lintie* 1. *Dibs* 2. *Chance* 3.
Visitors' Cup. *Kiazoku* 1. *Petrol* 2. *Vampire* 3.
Merchants' Cup. *Hoole* 1. *Bonny Doon* 2.
Ladies' Purse. *Chief Mongolian* 1. *Allendale* 2. *Gone Away* 3.
Diplomatic Cup. *Oyama* 1. *Montique* 2.
Mitsu Bishi Challenge Cup. *Dibs* 1. *Braemar* 2.
Lusitano Cup. *Kangaroo* 1. *Annandale* 2.
Hack Stakes. *Antelope* 1. *Isanhor* 2.
Spring Cup. *Annandale* 1. *Petrol* 2.

THIRD DAY.

Hurdle Race. *Lithslate* 1. *Admiral Rous* 2. *Gladiator* 3.
Owners' Cup. *Chief Mongolian* 1. *Grey Friar* 2.
China Champion. *Braemar* 1. *Dibs* 2. *Bonny Doon* 3.
Japan Champion. *Oyama* 1. *Allendale* 2.
China Consolation. *Sunbeam* 1. *Velocity* 2.
Japan Consolation. *Distemper* 1. *King All Francis* 2.
Ledger Cup. *Allendale* 1. *Dibs* 2. *Lintie* 3.

Offended at our presumption in praising him last Friday, the Clerk of the Weather stopped the Athletic Sports on Saturday by a disagreeably wet day; so that they had to be postponed to Monday. Fair weather then again favoured the Association, but owing to Saturday's disappointment arrangements, had been made for other events, and the attendance was not equal to that of the first day. We anticipated, however, a good day's sport, and had it, for the races were keenly contested and resulted in close finishes. We must except the half-mile, which was a gift to Kilby, who made the best of his start, and was never approached. All, however, were pleased at the Secretary's victories, in this and in the 150 yards; as, besides staunchly carrying through the arduous duties of his post, he has all along been very steady in his attendance on the path, and his form has considerably improved during the last year. It was a good day for 'officials,' for Cobden, too, reaped the harvest of his experiences as starter, going away from the four other competitors in the married men's and Honorary Members' Race and winning easily. He carried off an appropriate prize, which may be devoted to concocting 5 o'clock tea,—delicious meal—the brewing of punch, or—dare we say—the warming of caudle. The boys race fell to Kingdon, after a sharp tussle with Vincent, who could not make up his mind on which side to pass his competitor, and so lost ground. The jumping events proved very interesting. A. H. Dare won the hurdle race from scratch in good style. In the high jump, Olmsted, leaping very elegantly, cleared 5 ft. 2 in.; and with the pole, A. H. Smith got over 9 ft. Charlesworth (2nd.) jumping well, but failing to clear 8 ft. 9 in. which, with his allowance of 4 in. would have given him the prize. The Yokohama Athletes, by the way, are still in the rear with the pole, the best performance having been done in Shanghai, viz. 10 ft. 3 in. Mr. Smith is a strong and graceful pole-jumper, but he lacks practice, and—it seemed to us on Monday—condition. This competition was keenly watched by the members of the faculty, one of them evidently considering the heap of sawdust placed for the gymnast to alight upon, a mean, if not a needless precaution.

The great feature of the day was the steeple-chase. This year the Committee had selected a new course, which had the great advantage of enabling the spectators to see the competitors throughout the run; on previous occasions, they had been lost to sight in bamboo copses, wooded hill-sides, &c. and their 'shreddy' costumes at the finish, alone bore witness to the severity of the work. This year, by putting up some artificial fences on the inner part of the ground, a very severe course had been obtained. Starting from the Grand Stand, along the flat to the water jump, wider than in previous years, and then over a hurdle Dare and Lingham led the field; up the Bluff to the right, and down again, of course, Dare improved his lead; he loves that hill-side and a 'coulasse' by which the descent is made has been worn out by him in former hunts. Returning again to level ground, Lingham fast gains on him, and at the second water jump, a pretty piece of bank, fence and ditch, he takes the lead. And wisely, for the lead gave him a great advantage at the 'gridiron,' a complicated espalier-like machine of bamboo, over which—walking, jumping, floundering, and rolling,—the performers had to pass, amidst roars of laughter at their disasters. All plans were tried by various men, but all seemed equally puzzling. At the water jump, for the second time of taking, Dare fell badly, and knocked out of himself most of his remaining wind. Lingham was therefore left to finish as he liked, Smith obtaining third prize, losing by two seconds from Dare, who gamely struggled in second, in spite of his tumble; Clode, who had enjoyed three several baths on the road, bringing up the rear.

We cannot close this record of the Spring Meeting of the A.A.A. without noticing the performances of Mr. Ward, one of the Tokio representatives. He proved himself good pretty well all round, winning the 100 yards race, and running a very good second in the 150 yards, and the same in the walking race. He also won the hammer-throw with a very fair cast of 87 ft. 7 in. In this he wants practice for style, rather than for strength, for "right kin of Thor, he clove his way through, right onward amain." We hope to see him and other Tokio men well forward at our sports at the next meeting.

A sailors' half-mile race, won by Taylor, of the *Kestrel*, brought the sports to an end: and the prizes were then presented by Mrs. Rickett, who congratulated each successful competitor or his victory in a few kindly sentences, as he was presented to her. It seemed, by the way, as if the meeting had been too successful, one luckless wight only being left to walk over for the Consolation. Three and one more hearty cheers for Mrs. Rickett, expressive at the same time of the spectators' thanks to her for presiding, and their good wishes for *bon voyage* home next week; three more for the ladies of Yokohama, and three more for 'our noble selves' closed the very pleasant and successful A.A.A.'s Spring Meeting of 1878.

To-morrow, (Saturday) we hear that the Cricket Club opens its season with a match, the Club v The Services and the Professions. We conclude by giving the solution of our last week's puzzle. French scholars must please to imagine the accents.

5 AOUT, 1873.

THE TIMES OF TAIKO.

(FROM THE JAPANESE.)

BY F. BRINKLEY, CAPT. R. A.

ISHIKAWA GOYEMON.

Chapter XVIII. THE CALDRON OF OIL.

NEARLY all the nobles resident at Fushimi—some four score in number—as well as the court officials and officers of the household, assembled to witness the interview between the Regent and the robber. Apart from the unparalleled daring and magnitude of the man's crimes, his fortitude under the torture had imparted a certain romantic interest to his fate. He had not hesitated to confess his own guilt, but as yet no suffering had been able to wring from him the names of his accomplices, and this fact, added to the peculiar creed of discrimination he had always followed in the choice of his victims, excited a universal curiosity, not unmixed with commiseration. The Regent himself was well content to foster this excitement for the sake of its results. The occasion could scarcely have warranted an official convocation of peers and statesmen, but their voluntary presence at the confession of Hidetsugu's treason, would largely facilitate the Minister's subsequent punishment.

Goyemon was carried into the castle garden and propped up in a kneeling position before the verandah. One half of his body was completely paralyzed, and the rest scarcely less infirm, but his eyes, dilated by pain and blazing with fever, seemed to be animated by all the vitality his nerves had lost. A phalanx of guards and officers kneeled on either side, and from the alcove where Taiko sat, to the very edge of the verandah, all the spaces of the immense hall and the long corridors that bounded it, were occupied by a crowd of dukes, earls, barons and bannerets.

Ishida Mitsunari addressed Goyemon:—"Prisoner, though your crimes have outraged the ordinances of heaven and the laws of men, His Highness the Regent has graciously yielded to your prayer, and condescended to receive your confession himself. Speak therefore, with the respect and candour that such clemency deserves."

Goyemon, bowed with suffering and exhaustion, seemed to have assumed a position of obeisance, but at Ishida's words he straightened himself with a supreme effort, and after a leisurely survey of the assembly, fixed his gleaming eyes on the Regent.

"I have not confessed to your councillors," he said, and the vigour of his voice contrasted strangely with his en-

feebled condition, "because if justice were equal, they should have shared, not directed my punishment, and the statement I am about to make now is not wrested from me by torture, for my body has suffered all that it can endure, nor yet by awe, for as the descendant of Ishikawa Sayemon, I see nothing here but a host of upstarts and plebeians."

At this curious exordium, Taiko caused the blind that concealed his face to be raised, and looked out in astonishment at the prisoner.

"I have had many under my orders," continued Goyemon, "but of them I shall say nothing, since the servant is not responsible for his master's acts, and since I come here to tell you, not of myself, but of a robber in whom alone I acknowledge a master; a robber whose crimes have as far surpassed mine as his present unparalleled magnificence mismatches his infinitely mean origin. I have never stolen from the poor or oppressed the weak, but he has been the author of indiscriminating misery, and his frauds have impoverished the whole country. I have never forgotten my fealty, but he has murdered or enthralled the sons of the man that raised him from nothingness to nobility, and purloined their inheritance. If my enterprises have involved the deaths of a hundred miscreants, his ambition has cost Japan thousands and tens of thousands of her noblest lives, and if my plunder has been the miser's gold and the extortioner's gains, the object of his theft has been the sixty-four provinces of Japan. This is the robber that I denounce. Choose for yourselves the least opprobrious of his names; Hiyoshi, Saranosuke, Tokichiro, Hashiba, Hideyoshi or Taiko?"

If the Storm Dragon or the God of Thunder had suddenly swept down from the blue sky of summer into the castle gardens and the presence of that august assembly, the apparition could scarcely have been accompanied by greater amazement and consternation than Goyemon's words produced. Bitterer, a thousand times bitterer than this vilest of insults, was the utter impossibility of avenging it, for did this ruffian reviler possess a myriad lives, the total of their cruellest and most agonizing annihilations could balance but a tithe of the indignity he had put upon the aristocracy of Japan. Words to express their wrath, expedients to vindicate their honour, measures to appease their passion, all alike failing, this century of outraged potentates sat glaring impotently on the solitary author of their shame.

The Regent himself however showed no signs of anger. Restraining the Censor Hideiye, who was about to lower the dais curtain, he scrutinised the faces of the courtiers for a moment, and then burst into a loud laugh. "You shall obtain your wish, miserable scoundrel," he said, addressing Goyemon, "but if I put a term to your suffering, it is not because you have moved me by impertinences which you do not believe yourself, but because I do not choose to expose my officers to the insults you might utter under torture. Let him be removed, Ishida. His execution is fixed for to-morrow morning."

The gleam of joyful relief that lit up Goyemon's pallid face as he was carried away, proved how truly Taiko had divined the motives of his conduct. He thought nothing of the possible form of his death: it was sufficient that he had obtained permission to die while he had still strength to die bravely. Hours of exquisite suffering had not daunted him, but their sequel had been pregnant with a terrible presage of fever lurking in shattered bones and torn flesh; fever that opens the chambers of the poisoned brain and betrays the most sacred secrets of the heart. From this there was no escape but death, and never has rapture of reprieve been keener to a condemned criminal, than sentence of execution was welcome to this maimed sufferer.

But Taiko had resolved that the horror of the man's end should atone for its acceleration. He invited the courtiers to send in proposals describing the form of death each deemed most terrible.

Merciless and undignified as this suggestion was, the august councillors and peers received it with acclamation, not only for the sake of its novelty, but because all would thus contribute to avenge the insult offered to all. After much consultation and consideration, a number of propositions were submitted. Some embodied the combined wisdom of three or four projectors; other were the devices of solitary artists; a few were in verse, and several had pictures attached, descriptive of the tortures they recom-

mended. The Censor, Hideiye, suggested crucifixion with the head downwards; Ishida advised drawing by oxen, and Nagatsuka advocated burying up to the neck in the ground and cutting off the head with a wooden saw. But nothing of all this found favour with Taiko. Goyemon's crimes, he said were unparalleled, and his punishment should therefore be unprecedented. It was necessary that posterity's memory of his deeds should be inseparable from that of the suffering they had entailed, and no form of death as yet proposed was adequate to secure this result.

Barbarity seemed to be on the point of defeating itself from lack of ability to be sufficiently barbarous, when Hideyuki, the young Earl of Aizu, then a lad only fifteen years old, suggested that Goyemon should be put in a large caldron of oil and boiled alive. This idea was hailed with delight by most of the courtiers, and immediately received the Regent's approval, in spite of the remonstrances of the Duke of Kaga and a few other merciful men, who contemplated such an atrocious act with horror and abhorrence.

The news of this pitiless decision was carried to Goyemon at once. It was no small part of his torture that he should be obliged to anticipate it, and surely the thought of the inconceivable anguish that awaited him in the morning must have been a fearful companion to his loneliness all through the long watches of that last night. Did the memory of Chiyo, the gentle-hearted, faithful Chiyo, look in on him and lighten the gloom as he lay crushed and lacerated on the hard floor of his cell, or was the darkness peopled by phantoms of remorse, and ghosts of ill deeds that crept up from the sepulchre of the past? None can tell, for those that watched him found something so awful in the immensity of his past and the mystery of his future sufferings, that they dared not address him, and even spoke with bated breath in his presence, so that from dusk to dawn he remained speechless and almost motionless, his head resting on his arms and his face hidden.

Chiyo meanwhile, her vague forebodings cruelly intensified by Goyemon's parting words, had passed the preceding night before the cenotaph of Kanko,* the tutelary saint of suffering innocence. Many a time before had she taken refuge with her uncle, the canon of Tenjin, during the progress of Goyemon's enterprises, but never until that day had the possibility of failure been admitted or even—so far as she knew—conceived by her husband, and when solitude and darkness hid her from eyes that might have surprised her secret, she fell into an agony of suspense, scarcely less difficult to endure than the tortures presently to be inflicted on her husband. With all her brave resolution she could no longer struggle against the conviction that she had ceased to hope and now only awaited the confirmation of her fears.

But when and in what form would that confirmation come? This was the question that repeated itself again and again, until its echoes seemed to people the stillness deepening around her. In her harrowing disquiet she was no longer able to shape those set formulae with which men are wont to implore the help of heaven, but if prayer have any kinship with the passionate invocations that rise from the soul in its moments of supreme anguish, if prayer be not altogether different from the voiceless appeals that helplessness and despair address to some power acknowledged most in times of trouble; then surely she prayed with a fervour that might well have won fuller pity than she found.

Midnight had long been marked by the temple bell, when she was visited by a strange fancy, the creation it might be of a fevered brain, the evidence it might be of that mysterious power which, on the eve of eternal separation, carries love's farewell from heart to heart with a force that mocks at distance.

On the golden ground of a panel in the fane of Tenjin, the last scene of Kanko's life was depicted. Worn and

* Kanko or Michizane was second Minister of State (Udaijin) under the Emperor Udajō. He fell a victim to the intrigues of the Sadaijin (Fujiwara) and was banished to Tsukushi in Chikuzen, where he died after seven days' fasting and prayer. It is said that his favorite trees, a plum and a pine, disappeared from his garden at Kyoto and grew up in one night at his place of exile, and that the written petition in which he implored the gods to establish his innocence, having been fastened by him to a branch of this miraculous plum and carried to the top of Mount Tempai, was snatched up to heaven in a whirlwind. His fate drew down the curse of the deities on the Imperial family, and obliged the Emperor Yenguin to build the fane of Tenjin as an atonement. F.B.

emaciated by seven days of supplication and fasting, he stood on the summit of Mount Tempai, bearing aloft in his hands the plum branch to which his petition was attached. The whirlwind that subsequently carried this petition to the throne of the gods was already wreathing its turbulent eddies about his feet, and beating against his features, rigid with anguish and entreaty, while through a rift in the blackness of the storm, the eye fell upon a distant stretch of curving shore, studded with comfortable cottages and bathed by a sun-lit sea, into which mews and curlews dipped their snowy bosoms. Gazing almost unconsciously at this picture, it seemed to Chiyo that Kanko's figure gradually assimilated itself to that of her husband, the plum branch in his hand becoming a sword with which he opposed the attacks of some invisible enemy, while at the same time he struggled to free himself from the whirlwind, now transformed into an immense snake, coiled about his feet. The terrified girl covered her eyes for a moment, believing that this dread conception had grown out of the intensity of her own gaze, but when she looked again, the picture had not changed. Goyemon still stood sword in hand, half his body hidden by the dark folds of the snake, but presently, tottering as though about to fall, he turned towards his wife a face of such anguished despair that her heart ceased to beat and a cry of horror parted her lips.

It was at that very moment that Goyemon sank to the ground among his enemies in the Regent's castle, and at once, deep into Chiyo's soul, entered the despair she read in his gaze before a mist of tears hid him from her eyes for ever. Had she been with him from first to last; had she seen him beset, dragged down and bound by a host of foes, the fatal truth could not have been borne in on her with more distinctness than it was by the magical changes of this picture. She knew, knew beyond the possibility of doubt, that her forebodings were realized, and that she could never be with her husband again, save in memory. And even this sad solace seemed to fail her; for although in the overwhelming dreariness of her desolation she would fain have summoned from the past some kind experience or happy retrospect, nothing came to her but the overlasting echo of Goyemon's farewell words, "remember only what I have tried to be for your sake."

The voice of true sorrow in its first intensity is ever thus a monotone. However varied and individually terrible the steps by which the final catastrophe has been reached, the breaking heart always selects as the key-note of its threnody some simple reminiscence, often the last, sometimes the least important, of the sad series, and to this attunes all the cadence of its regrets. Not the many sweet tokens of dawning intelligence awakened by her care, nor yet the smiles or tears she has so often summoned or soothed, minister most to the bereaved mother's early sorrow, but some trivial memory, such as, it may be, the first pressure of her baby's fingers, it may be its last lisping of her name. So, too, in the bitter pain of recent loss, love does not busy itself with long retrospects of delightful fellowship or reviews of passionate hours, but rather recalls some passing glance of tenderness or half uttered whisper of devotion. It is only when the flood of tears begins to subside, that we discover, one by one, the relics over which its waves had surged.

Dawn, sunshine and noonday, but as yet no tidings of Goyemon. The moment had come when Chiyo must elect either to follow her husband's orders and leave Kiyoto, or remain at the risk of her own and her son's lives. She did not choose, and yet she remained: remained, hour after hour, listening with sickening dread to the sounds of life in the city and starting at every voice that disturbed the quiet of the cloister. Sometimes she thought of confiding in her uncle, sometimes she was on the point of going out and questioning those that came from time to time to worship at the shrine, but the idea of what she might hear was so shocking that even suspense seemed preferable.

When evening came however, and the feet of the pilgrims growing less and less frequent, silence and seclusion once more possessed the old fane, she determined to return to her home and learn the worst, or, it might be, perish with her husband.

On the way, she might easily have obtained the information she sought, for men, sitting at the thresholds of their dwellings in the summer evening's cool, or standing in groups before the bath-houses, were already discussing the horrors of the following morning, but suffering had

made her so painfully timid that she now almost regretted the solitude of the cloister, and shrinking back in her palanquin, clasped her child to her throbbing heart, scarcely daring to think,—nay, scarcely capable of thinking.

She dismissed her attendants however, when still some distance from her destination, and performed the rest of the way on foot, at first walking rapidly but insensibly diminishing her speed as she came in sight of the house. An old pine grew before the gate, stretching one of its arms across the lintel almost to the vestibule within. Under this she stood for a long time, vainly summoning courage to demand admission. The stillness was so appalling: no voice, no light, no sound; only the soft breathing of her sleeping child, and an almost imperceptible tremor of the pine sprays overhead. Had life and sense, then, utterly deserted the place and was it already peopled by the silent shades of those she had loved and been beloved by?

She waited cowering beside the pine tree, conscious that if nothing came to break this ghostlike hush, she must remain for ever under the influence of its spell. But presently the feet of the faintly treading breeze passed rustling up the avenue behind her. Nearer and nearer it came, until, wreathing her in fragrances of the lily and lotus and shaking the arms of the pine above, it finally pushed gently at the gate beside her, and lo! the heavy leaves, swinging slowly back on their hinges, disclosed the court-yard and the vestibule, sombre and deserted.

Chiyo sprang in and entered the house. She did not speak or call, but passing quickly from room to room, found all the doors and windows open, and the whole place dismantled and untenanted. She was alone, utterly alone: unable even to fly from this solitude and yet knowing instinctively that it had been caused by the apprehension of some peril to which she exposed herself by remaining. Until that moment she had borne up bravely, but this merciless evidence of the worst, this hopeless, unutterable desolation, this absence of all fellowship or sympathy in the very place where but a few hours before she had been so happy and so confident; all this was too rude a shock for her tender heart. She sat down, not tearful or complaining, but stunned and almost senseless. Fate had led her back to her home, and against fate she had neither strength nor will to struggle any longer.

Alas, that the darkness of sorrow should have clouded so gentle a mind and the weight of suffering crushed so sweet a nature! And yet it was perhaps better that it should be so, for even then, search and enquiry were conducting the emissaries of the law nearer and nearer to that solitary house and its one unhappy inmate.

Yes! the decree that sentenced Goyemon, extended his punishment to his family. Insatiability of revenge rather than refinement of cruelty had dictated this clause, and though its knowledge would have multiplied beyond endurance the sufferings of Goyemon's last night, inadvertence, not compassion, permitted him to remain in ignorance. It was little likely indeed that his judges could understand how small a portion of the man's heart was occupied by the consciousness of his own fate. Enormity of crime scarcely possible to any but the sternest disposition; robust energy that seemed to deride every gentle sentiment; recklessness that defied both Gods and men, and arrogance that scoffed at rule and rank: behind all this, who would have looked to find a passionate love, robbing death of every pain but separation, and deeming any sentence merciful that did not include the object of its affection. Yet such things are neither new nor strange; for even as the pearl-shells in the abyss of an ocean valley are hidden by the waves that rock on the surface, so the coldest and harshest natures often enclose a jewel of tenderness that only becomes really visible when the storms of life cease to trouble the depths that conceal it.

The earliest rays of the midsummer sun were still low on the horizon, when the troops assembled to escort the prisoner to the plain of the Seven Rivers and Roads at Kiyoto. Two hundred men under the command of three veteran captains formed the van-guard—an extraordinary precaution suggested by the condemned man's relations with the Prime Minister—then followed sixty halberdiers, the blades of their long weapons uncased and glittering in the morning light; then a band of *shirri*, shouldering strange implements for the capture of malefactors—grapnels, crooks, jagged-heads and clutch-poles—and finally a rear-guard, consisting of a hundred and fifty men-at-

arms. Goyemon was placed between the halberdiers and the *shirri*. He had desired to be dressed entirely in white and conducted to his execution on horseback, and his requests were immediately accorded, for the law treats its victims with disdainful kindness in their last moments.

In this guise then, the cavalcade set out, and having made the inner and outer circuits of the Regent's castle, took the road to Kiyoto. The morning hazes were still brooding over the woods, and the leaves had not yet shaken off the dew of slumber, but round and above the great city a hoarse, myriad-voiced wave of sound surged and rolled in over-deepening volume; for all the population of the Capital and the country, marvelling at the fabulous deeds of the criminal, and moved most of all by the appalling nature of his punishment, was flowing from street and suburb in unceasing streams towards the Plain of the Rivers and Roads.

Down to that immensity of life, threatening to pursue him with its clamour into the silence of eternity; down to the scenes of past pleasures and triumphs, whose mournful memory would haunt the sleep of death; down to the place of torture, inconceivable, unendurable, the miserable man rode, his body racked with pain and his heart bursting with dread. Not the dread of anything that waited himself, but a sickening apprehension lest among the always increasing crowd of faces that watched him from wayside or window, his eyes might at any moment encounter Chiyo and his son. If this were to happen; if the loving girl were to spring to him and proclaim him her husband—as her fearless faith would surely impel her to do—if the shadow of his fate should fall on her, and draw her with him to agony and death, then indeed he knew that his manhood would break like a straw before the hurricane, and his misery crush him in the sight of all the people. Insensible to everything but this overpowering anxiety, his haggard gaze rolled unceasingly from side to side over the turbulent sea of spectators, and the great heart of the multitude, sensitive and sympathetic, detecting this fearful scrutiny, answered it by a low murmur of awe and pity.

A few furlongs before debouching on the Plain of the Rivers and Roads, the procession passed the house of Mori Joken, a banneret with whom Goyemon had been on terms of the greatest intimacy. It is hard to leave this world of love and fellowship without the echo of a single familiar voice ringing in one's ear, or the glance of a single compassionate eye softening the aspect of death, and Goyemon, oppressed with loneliness, and visited suddenly by the pleasant memories that lingered about this well known spot, from whence too, his own home was visible, asked permission to halt a moment, and receive a draught of wine from Sir Mori's servants. He was careful not to hint at his acquaintance with the banneret, but simply based his request on the old nobleman's reputation as a benevolent philosopher.

Goyemon's real character had been entirely unknown to Sir Mori, and it was with a solicitude surprising to himself that the condemned man waited to see whether his former friend would utterly cast him off in this, the hour of his disgrace. He dared not hope that the banneret would himself appear, but he determined that if his request were entertained in any form, he should regard it as a token of sympathy.

Sir Mori, keenly commiserating his friend's misfortunes, was induced to grant this entreaty not only by the impulses of a truly kind heart, but also because he had accidentally come to the knowledge of the circumstances attending the robber's capture, and pardoned his crimes for the sake of the magnanimity with which he had preferred sacrificing his own life to raising his hand against his former benefactor. The draught of wine was therefore presented, not by the banneret's vassals, but by the banneret himself, dressed as he might have dressed to receive an honoured guest, and holding in his hands the very flask and goblet that Goyemon had so often admired. But it was not the sympathy of this faithful friend that made the dying man's heart swell with unspeakable gratitude, nor was it sharp regret that choked his utterance and clouded his eye, but the aspect of Momoji Sandayu, standing beside the banneret, and looking full and frank forgiveness at his old pupil. Some that happened to be near Goyemon at that moment, observing that he trembled violently, and bowed his head to hide the evidences of his emotion, believed that sorrow and suffering had at last shattered his

iron nerves, and left him little strength to face the fearful end; but his two friends remembered afterwards, that before the escort had re-formed to move away, he was sitting upright in his saddle, and bearing himself like a man who had suddenly shaken off his pains and escaped his doom.

Seven roads, creeping hither and thither, over the bridges, through the fords and among the windings of seven rivers, gives its name to the wide plain that lies beyond the south-easterly angle of the Great Embankment. The place selected for Goyemon's execution was a level space within the elbow of two roads, of which the one travelled southwards along the bank of a shallow stream, and the other striking due east, formed the main avenue to the heart of the city. Here a circular area, some fifty yards in diameter, had been enclosed with a stout palisade to keep off the people, who clustered in one immense, unbroken mass, in every direction, as far as the eye could reach. On the opposite sides of this enclosure, long canopies were stretched to shelter the civic authorities and the officers of the escort, while in the middle stood a huge iron caldron, filled with oil and surrounded with faggots of charcoal. When the head of the procession reached the entrance to the enclosure, and the vanguard, opening out to the right and left, gave passage to the halberdiers and the prisoner, a breathless silence spread gradually from the innermost to the outermost circle of the countless multitude.

Goyemon, before he was taken down from his horse, asked leave to address the people. "My life as a malefactor," he said, "has no equal, nor my punishment as a criminal, any parallel. I acknowledge the justice of my fate, nor would I have it otherwise, for if not my deeds alone, certainly the addition of my unexampled death will establish for me the title of 'the King of Robbers.' But you, good people: you that win your bread by honest toil, nor grow rich by tyranny, pray for me that I may find rest hereafter, and that the memory of my torture may not trouble you in your times of solitude."

These words were spoken in a tone of such force and firmness that their import reached far into the depths of the crowd, and from the point where their accents began to fall faint, ten thousand voices took them up and carried them back to the confines of the multitude like the roll of a giant echo.

After this Goyemon was taken from his horse and placed in the caldron. The oil reached almost to his chin, but his head was kept always above the surface by an iron collar which encircled his neck, and was attached by chains to two opposite points in the rim of the caldron. The caldron itself was supported by a belt from which six massive iron legs descended, embracing below a space slightly hollowed out, to facilitate the building of the faggots. But when these faggots were lit, and men contrasted the insignificance of their smokeless glow with the mighty volume of the caldron, murmurs of remonstrance and pity broke from many a lip, for it was plain that the death, lurking in the heart of the slow fire, must travel with infinite tardiness through the viscous torpor of the oil.

How long then would the agony be deferred and what would be the first token of its approach? The summer sun, already high in the heavens, beat strongly down on the heads of the waiting multitude; a throistle sang in one of the pines that sheltered the executioners, and the tolling of a distant temple bell mingled its vibrations with the tremulous breath of the noonday heat; but for the rest, the silence was so unbroken that the rippling of the seven streams carried to the ears of the condemned man mocking visions of coolness and repose. Either by accident or design, he had been placed so as to face the entrance to the enclosure, and the people remarked that his eyes, petrified into the same changeless stare of awful anxiety, remained continually fixed on that one spot.

Was there still something on earth then, that had power to divert the miserable man's thoughts from his own terrible fate?

An hour elapsed, and as yet his face had undergone no change, except that its ashy pallor was replaced by a flush of deepening crimson. The suspense began to be unendurable, when suddenly a slight convulsion disturbed his features, and the words "Namu Amida Butsu" passed from his lips in a long sigh of suffering. Then the people, knowing that his agony was upon him, caught up the echo

of his prayer, and raised it towards the heavens in an immense pulsation of sympathy.

Almost immediately afterwards a low rumbling sound, like the muttering of distant thunder, began to issue from the caldron, and a thin wreath of smoke curled along the surface of the oil. Goyemon's eyes seemed as though they would start from their sockets, and deep groans broke from his panting lips, so that many of the spectators hid their faces and others grew pale as they looked.

But at that moment a commotion was observed among the guards at the entrance, and presently five or six halberdiers hastened in, pushing before them a woman with a child in her arms. She was a girl of frail but wonderful beauty, richly dressed after the fashion of a nobleman's wife, but her distraught air and the wild unrest of her gestures, bespoke either insanity or the delirium of suffering. Evidently unconscious of anything but the circumstances passing in her immediate neighbourhood, she was hurried into the presence of the officers presiding at the execution before she had noted the caldron or its occupant, who at the sight of Chiyo and his son, ceased to groan, nay almost to breathe, and remained perfectly motionless in the scalding oil.

She fell on her knees before the officers, and after a vain attempt to speak articulately, held up her child with a gesture of piteous appeal.

"Who is this woman?" demanded the chief officer, addressing the halberdiers.

"Isikawa Goyemon's wife, Sir," replied one of the men in a low, reluctant voice, "and the child is his son."

The officer turned and looked from one to the other of his comrades. No words were uttered, for even these strong men quailed before the terrible necessity that constrained them.

The Chief rose to his feet, and speaking so that his words were audible to those surrounding the palisade, said:—"We have no choice but to obey the Regent's orders. Soldiers, to the caldron with the woman and the child."

At this fearful verdict, a vast wail burst from the horrified people, but the woman, interpreting only the compassionate look of the officer's face, rose mechanically, and suffered the soldiers to lead her away. When however they attempted to take the child from her arms, she clutched it convulsively, and then for the first time, a mother's instinct quickening her senses, she saw her husband's distorted features, and heard the low thunder of the oil already simmering about his feet.

She gazed at him for a moment, folding her child tighter and tighter to her bosom, and then with a strange, gasping cry, fell to the ground—dead.

The soldiers, not without considerable pains, unlocked her arms, and taking the boy, carried him towards the caldron.

At their approach, Goyemon twisted and writhed with such frantic energy that the whole contents of the caldron heaved and splashed about. The men, therefore, standing at a little distance threw the child over the rim, but to the astonishment of all, Goyemon raised his arms and caught the boy above his head. Whether the oil had helped him to slip off his bonds, or whether—as some affirmed—his hands emerged half skeletons, it is certain that the unhappy man strangled his child to save it from his own sufferings, and then, with the last remnant of his strength, unhooking the collar that encircled his neck, sank with the boy into the depths of his awful grave!

(To be continued in our next.)

THE JAPANESE PRESS.

THE PRETENCE OF CONSTITUTIONAL GOVERNMENT.

(From the 'Choya Shimbun'.)

WE HAVE indeed so-called "Councillors of State" (*Giseikwan*) but their proceedings are altogether under the control of the Privy Council (*Naikaku*) and directed merely to idle discussions of legal reforms. We have also so-called "Officers of Justice" (*Saibankwan*) but they are subservient to the Executive Council (*Giyosaikekan*) and are unable to exercise legal functions, except in a very limited degree.

Who then can say that the three principles (deliberative, executive and judicial,) are equally represented in the present constitution of Japan.

When the Deliberative Assembly and the Supreme Court were established by Imperial proclamation * (on April 14th 1875) and it was announced that the principles of representative Government would be gradually adopted, people fancied that they saw in the creation of these two bodies, not only the germ of wide judicial reforms and extension of the laws' untrammelled execution, but also an assurance that the three principles, deliberative, executive and judicial, would now be clearly defined, and given equal constitutional *status*. Verily, those who indulged in this delusion are now in a position to appreciate their error.

The constitution of our country remains a despotism, and the Privy Councillors having sole and entire authority, everything is decided at their Board, and the *Genrō-in* and *Daishinin* are in a much lower position, and indeed only the servants of the Privy Council. Where then in them can the three principles be distinguished? That the supreme rulers of the country should also be its law-makers and law-administrators has been the traditional system in despotically-governed, Oriental countries from time immemorial; and if we look back into the history of our own country, we find this has always been the case. But now that, in addition to the *Daijokwan* (Council of State) we have the *Genrō-in* to deliberate on and frame laws, and the *Daishinin* to administer them, Governing, Law-making and Law-administering would seem to have been distinguished. And this may be the reason why people imagine that the three constitutional principles, the establishment of which are their rights, are already duly secured. This is a delusion. For if, by the mere creation of the *Genrō-in* and *Daishinin*, in addition to the *Daijokwan*, the distinction was established between the Governing, Law-making, and Law-administering bodies, then the position is the same after the Proclamation of 1875 as before: because, immediately after the Restoration, the Government created the *Shiugi-in* (Law Chamber) which was afterwards abolished, and the *Sū-in* established in its place; and its duties being to frame new laws, and to revise old ones, its position must have been much the same as that of the existing *Genrō-in*. Are we to believe that the *Shiugi-in* or *Sū-in* of former times were purely law-framing assemblies, and ranking with the *Daijokwan*? Not so: law-makers ought not to be under the control of the rulers of a country, but should exercise the exclusive right of framing or abolishing laws, and the executive Government ought not to be allowed to interfere with them. But the members of the existing *Genrō-in* are only invited to debate upon subjects submitted to them for discussion by the executive Ministers, and the adoption or rejection of the measures, or the suggestions of the *Genrō-in*, lies solely with the Privy Council. Also the most important edicts are decided on, and Notifications of them issued by, the Privy Council; and though indeed, the *Genrō-in* have one opportunity afforded them of considering them, it is a matter of common report that they have no sufficient power of discussion, nor time allowed them for proper deliberation. If this is the case, the important right of Law-making being vested in the Privy council, the members of the *Genrō-in* have simply to comply with the requests of the former, and are at their orders. Although, therefore, the *Genrō-in* as at present constituted, has the appearance of a body of the high rank of Law-makers; in reality it is but a sub-section of the *Daijokwan*. How, therefore, can people say that they are equal in rank.

The relations between the Administrators of the Laws and the Executive Government is just as unsatisfactory. As the Cabinet Ministers do not actually sit in judgment on cases, there does, at first sight, appear a difference between them; but as regards rank and the principles of right,—no explanation is needed when comparing the two, for all the Judges, from the *Daishinin* downwards, may be either promoted or degraded, appointed or dismissed, simply at the will of the Cabinet Ministers. We are told that, at present,—setting aside cases brought against Government Departments,—even complaints lodged against Provincial Governors, to whose administration the people object, cannot be judged by the Judges, in accordance with the Law;—but must always be submitted to the *Daijokwan*, and its orders must be waited for. But this, not being mentioned in the Rules for conduct of business at the *Daishinin* and other courts, we are not inclined to believe. Should anything approaching to it, how-

* We reprint the Proclamation referred to:—

ever, exist in practice, we must say that, not only are the Governing and Law-Administering principles of the Constitution not of equal rank, but that as the Ministers have the power of removing the Judges, the two departments are entirely confused. And even should the reports alluded to be entirely without foundation, still such a statement as that "there being the *Genro-in* and the *Daishin-in*, as well as the *Daijokwan*, the three principles are preserved and are of equal rank in the Constitution" is an error of the greatest magnitude. In a recently published book we read that the writer plainly says:—"The distinction between the Law-framing and Governing bodies is clear." He must himself be deceived, or be deceiving us; for we say, decidedly, that our government is a pure despotism, and the actual right of making and of administering the laws is in the hands of the Cabinet Ministers, and that it is certainly an error to say that the three principles of constitutional Government are at present in existence in this country.

IMPERIAL PROCLAMATION. NOTIFICATION No. 58.

(COPY OF IMPERIAL DECREE.)

At the time of Our ascension of the Throne, when We became the Head of affairs, We summoned together the whole of Our servants, and on five several points took oath before Heaven: We determined the welfare of the country, and sought after the means whereby to ensure the peace and tranquillity of the people. By the favour of the spirits of Our ancestors, and also by the exertions of Our servants, We have happily attained the slight degree of tranquillity of the present day. But, upon consideration, We find that Our assumption of power dates from no far distant period, and that, as regards the pacification of the interior of Our country, there are by no means few matters that have to be set on foot, or freshly regulated. Wherefore, We, now extending the spirit of Our oath, do here found the *Gen-ro-in*, and thereby widen out the fountain head of the establishment of laws, and do create the *Dai-shin-in*, and thereby render firm the powers of careful judicial procedure:—We likewise call together the local officials, causing them to state the opinions of the people, plan the public welfare, and, by degrees setting on foot a well founded political fabric for Our country and homes, are desirous that each and every one of you should partake of its benefits.

Do you, then, abstain from becoming habituated to olden customs, through adhesion to former ideas; and beware, likewise, of paying little heed to your advancing steps, or of being slow to act. Give then, due attention to Our words, and use your best endeavours in regard thereto!

No. 59.

The *Sa-in* and *Yu-in* are abolished.

The *Gen-ro-in* and *Dai-shin-in* are founded.

The *Shikibu-rigo* is for the future attached to the Household Department.

The above is notified.

April 14th, 1875.

(Signed) SANJO SANETOSHI,
Prime Minister.

ARGUMENT TO LIMIT THE PRODUCTION OF SILK WORMS' EGGS. No. 1.

(From the 'Hochi Shimbun'.)

THE question as to whether the production of Silkworms' eggs should be free or limited, is now under the serious consideration of the people and especially of the members of the Association of the Silkworm Egg business—and although I am not yet aware of the results of the discussion, as I observe that some are in favour of free production, I hereby express my own opinion thereupon and support those who are in favour of limiting the production. Some say that "the quality of the silk depends upon not only the skill of the manufacturers, but upon the quality of the worms, and that the best plan, in order to gain a good reputation for our silk and to increase our export trade, is to produce, in large quantities, good and cheap eggs. And if the system of limiting the production be adopted and 1,500,000 cards manufactured in the whole country, of which 500,000 be taken for exportation and the remainder left for the requirements of the country; then, as it is impossible to know for certain the quantity required by foreigners, if the latter want to buy more than the estimated quantity, our merchants, only seeking for the profits immediately before them and not considering the requirements of the country, will export over the estimated quantity. This would be the course they would take and it would be impossible to resist it; and thus the silk-manufacturers would sustain not a little injury therefrom, and rather than such an injury be sustained from the adoption of the system of limitation, free production had better be per-

mitted. Then, if it should happen, that the Silkworms' eggs were in excess of demand, the loss of throwing them into the water or fire is only a temporary injury and if compared with limiting the manufacture, discouraging emulation in improvement and thus degrading the quality of our silkworms' eggs, which would be the more important?" On considering the words of this disputant, it would appear that he is afraid of the fact that, as we cannot always estimate the quantity of the demand for silkworms' eggs by foreigners, should they require more than the estimate, eggs would be sold to them without regard to the requirements of the country, and thus make it difficult for the silk manufacturers to obtain good eggs. If therefore the quantity of the demand by foreigners could be known, that fear would be removed. We hear that the quantity of Japanese silkworms' eggs required by Italy and France is from 700,000 to 1,000,000 cards, from 10 to 20 per cent of which are for France and the remainder for Italy, but the French demand varies every year, not according to the quality, but to the value. In the year 1876, when more than 1,000,000 cards of eggs were imported into France, the price being high, there were but very few purchasers, only 60,000 or 70,000 cards were bought, the remainder were all used in Italy. Although the silk manufacturers of Italy are mostly poor and can only buy one or two cards each, they appreciate good eggs, and a great number of poor people in that country make the production of silk their principal employment, whereas, in France it is considered as an extra, not as a principal business.

Thus it would appear that we can manage to estimate the probable quantity of the demand of Foreigners and if so, by estimating that of the natives, to determine the quantity to be produced every year ought not be a very difficult matter, and as regards the exportation over the estimate, a distinction between the requirements of home and abroad ought to be plainly made among the traders and a system of resisting secret exportation be established and well conducted. If this is done, there would be no injury sustained by the silk manufacturers.

Again, "in case of free production being allowed, the quantity of silkworms' eggs being in excess of the demand and the extra quantity being thrown into the water or fire, it would only be a temporary injury, &c., &c., &c." This argument does not seem to be a right one. A man may become wrong in his views from the excess of his liking or disliking anything. Now this disputant being too much in favour of free production, his view of the case is not impartial. Such as throwing the silkworms' eggs, in excess, into the water or fire as being the only means to adopt, in order to resist the fall in price—and although it may be said that it does well to show foreigners the decided mind of the country dealers, I, on the contrary, fear that it would only cause them to laugh at us, because it only shows that our silk egg producers, only seeking for their own profit, not considering the future, and carelessly producing a great quantity of eggs, will have to throw into the water or fire like last year, more or less in all future years. We cannot gladly see this being done. The case of last year is sufficient to prove an example for the future, and again, if it be allowed, how much would the loss come to? Is not the disputant who does not see such an easy reason as this, one who, I may say, has become wrong in his views from liking a thing too much? (*c. i. from prejudice.*) Is it not so?

EXTRACTS.

DE BUSSCHIE v. ALT,—and the DEVONSHIRE SILKSTONE COAL COMPANY.

(From 'The Times'.)

The Court of Lincoln's Inn on Tuesday, and Vice-Chancellor MALINS's Court on Wednesday, were occupied with two extraordinary inquiries into charges against persons in a fiduciary relation. Both cases have strongly marked features, but the suit before the Appeal Court elicits precedence in picturesqueness. The plaintiff, Mr. DE BUSSCHIE, desiring to sell a ship in Japan, consigned it for sale at a *net* price of 90,000 dollars, to Messrs. GILLMAN, merchants in China and at Yokohama. The defendant, Mr. ALT, who also trades in Japan, applied to Messrs. GILLMAN for a commission to find a purchaser, and such a purchaser was in fact found in an old customer and debtor of the defendant's late Prince of GAYSHIEU. But the peculiarity of the transaction was that Mr. ALT first tried to clear himself of his character of agent, or sub-

agent, by going through the form of buying the ship for himself at 90,000 dollars, and then reselling it to the Prince for 175,000, partly in cash and partly on credit. Mr. DE BUSSCHE had no notice that Mr. ALT intended to change his relation of agent for that of purchaser, and it is obvious that when such a relation is once formed it is unreasonable that it should be rescinded at the mere will of one side, without notice to the other. The argument employed for Mr. ALT was that Mr. ALT could not be fixed with the responsibilities of an agent, for that Messrs. GILLMAN, who were Mr. DE BUSSCHE's agents, had no authority to appoint another person to undertake their duties. So futile a piece of casuistry is sufficiently disposed of by the fact that, except as agent for Mr. DE BUSSCHE, Mr. ALT could have had no possible right to deal with a vessel which was known to be his. In acquiring the right he necessarily charged himself with the correlative duties. An attempt was next made to set up by evidence a customary right in Japanese ports for an agent commissioned to sell at a *minimum* price to take the goods at this limit, and at his own option. The Lords Justices visit this alleged custom with contemptuous condemnation. A man is generally free to agree to a one-sided bargain in which some one else has all the benefit, but Courts of Justice in such cases require very clear and positive evidence that the loser knew what he was about. A custom of trade is a convenient mode of dispensing with negotiations where the arrangement is so equally advantageous for both sides that their consent to the conditions may be assumed at once; but where there is no such equality of advantage, where the agent would have the strongest motive of self-interest to exchange his character of agent for that of purchaser without notice to his principal, Courts of Justice cannot in reason assume the assent of the principal without positive proof, and, therefore, cannot sanction the custom. The solitary possibility of persuading the Court that one who had obtained possession of property as an agent could make a profit of cent. per cent. out of it for himself was afforded by the machinery Mr. ALT employed to make the Prince of GAYSHIEU pay. It might be plausibly urged that a mission on board a man-of-war to recover the purchase money could scarcely be held to come within the ordinary duty of an agent even in Japan. But this ground was cut from under Mr. ALT's feet by the fact that he did all this on his own responsibility, and without any notice to Mr. DE BUSSCHE. If Mr. DE BUSSCHE had been consulted, he might, perhaps, have preferred to accept Mr. ALT as purchaser instead of so formidable a debtor as the Prince of GAYSHIEU. As he was never given the option, he had a clear title to all the benefit accruing from his agent's exceptional energy. The Lords Justices, as did Vice-Chancellor HALL in the Court, below, have now affirmed his right.

The case before Vice-Chancellor MALINS has nothing to do with Japanese Princes or United States war steamers employed to levy a distress; but after its own modest and domestic fashion it is even more instructive. We have not all of us ships to sell to feudal nobles in Asia, but a good many of us have had relations with companies in liquidation. The Devonshire Silkstone Coal Company was wound up voluntarily in 1871, and a Mr. COWARD and a Mr. LORD were appointed liquidators with another gentleman, who has since died. They were instructed by the shareholders to sell the mine, and the sum of £21,000 was fixed as a price which might be expected. The anticipation was not unreasonable, as, according to the VICE-CHANCELLOR, "between £30,000 and £40,000 had been expended on the colliery, besides "which there were waggons worth £5,000, and there had also "been a dead rent paid in advance to the amount of £4,000 or "£5,000 more." In the end the liquidators accepted an offer by the brother to the company's secretary of £8,000. The approval of the VICE-CHANCELLOR's Chief Clerk was obtained for this curious transaction on the plea that no better terms could be made, and that the old shareholders were to be permitted to take shares in a new company which the purchaser was to form. But the VICE-CHANCELLOR says that, in fact, no such option was ever fairly given them; only five days were allowed within which they were to apply for shares, and some shareholders did not even receive the notice till the last day of the five. Mr. COWARD and Mr. LORD would seem to have been the only shareholders who had the prudence and promptness to avail themselves of this very peremptory offer. They took shares in the purchaser's company, and they have found the advantage. Within the first year after the sale the purchaser and his fellow-shareholders realized a profit of £20,000. The next year showed their wisdom yet more clearly; their profit for the twelve months was 255 per cent. on the purchase money. But Vice-Chancellor MALINS, instead of applauding the loyal faith these two gentlemen, the Liquidators, showed in their old company's inherent solvency by accepting shares in a concern which they had sold for £8,000 when nearly £40,000

had been spent upon it, has removed them, even at this late day, from their office, in sign that "persons taking upon them "selves the duties of liquidators must act with faith and honour." The punishment, the VICE-CHANCELLOR himself admits, is not very substantial; it is a good deal less to the point than the Lords Justices' transfer to Mr. DE BUSSCHE of the 85,000 dollars bonus the United States war-ship was instrumental in extracting from the Japanese Prince for Mr. ALT. But we need not be at the pains to appraise the exact worth of the credit the VICE-CHANCELLOR adjudges Messrs. COWARD and LORD to have lost. Certainly what they have lost in this way their old brother shareholders will not gain. We may hope, however, some means may yet be found of making their energetic sagacity in securing shares in the new and lucrative company redound to the material advantage of their old and ruined company, and of its shareholders, whose trustees they have been.

The worst feature in cases like these is that they are not cases of ordinary criminal fraud. Breaches of trust will be committed, and in high places in the commercial world, just as pockets will be picked under cover of patriotic enthusiasm in Hyde Park. When a merchant or banker violates the criminal law he is very properly treated like a pickpocket. But public morality is vindicated rather than scandalized by the offender's degradation. Cases such as these of "DE BUSSCHE v. ALT," "the Devonshire Silkstone Company," and the Manchester Warehousemen's case last year are much more alarming than crimes such as those of LIZARDI and Sir JOHN DEAN PAUL. The two cases in the Chancery Division are but striking instances of a vicious practice in trade of doing one thing under guise of doing another. Mr. ALT set up a custom of European merchants in Japanese ports by which they claim freedom to throw off the character of agents whenever they think it profitable to themselves. They are acting for the owner of property when it will fetch no more than the *minimum* price; they are acting for themselves when they can get something beyond that price. Lord Justice THESIGER even had to admit that evidence of the existence of such a custom had been produced. Yet it is obvious that its direct effect must be to sap the very foundation of the good faith on which the relation of principal and agent rests. A principal's chance of profiting by the ability and activity of his agent is but slender when the agent, if he finds that by ability and activity he may make a better bargain, is free to buy at the lowest and sell at the highest. There is the comfort that a practice so immoral is "scotched" the moment it comes within reach of an English Court of Justice. But not even that consolation is available in the Devonshire Colliery case. Two official liquidators are branded by a Court of Equity as having been false to their trust; yet no intimation is given by the Court that the injured shareholders are entitled to restitution at their hands. But even if, as we hope, in all flagrant cases of violation of duty by trustees a civil remedy be available, the cases are comparatively few in which it is either worth while or possible to extort pecuniary restitution from the offender. No class is victimized so greatly as the commercial class itself by these vicious customs and practices, by which agents abstract profits which belong of right to their principals. A duty is incumbent on the chiefs of commerce to set themselves to turning back the current of commercial opinion, which has lately been running stronger and stronger in favour of making out of every commercial transaction a profit which is supposed to compensate the work actually done. The main use of judicial decisions against the lawfulness of such secret profits is not that peculiar offenders are made to refund, but that they encourage the growth of a healthier custom of trade. But Courts of Justice cannot regenerate trade; that must regenerate itself. The correspondence we have published at various periods on the fashion by which architects, solicitors, and bankers extort bonuses and commissions from auctioneers, builders, stockbrokers, and all kinds of denominations of business men, on the simple ground that they have selected them for work they do not pretend to be able to do themselves, has shown how worm-eaten English trade is by a system which is nothing else than a civilized form of *Comorra*. In answer the other night to the question by Mr. BURR whether it was intended to legislate against frauds by fiduciary agents, including the practice of taking commissions, Mr. CROSS stated that he had decided to introduce a Bill on the subject. As we think about the real value of condemnations by the Court of Chancery of illegal profits by agents, so we think about changes in the criminal law respecting the relations of principal and agent. We hope more from the indirect than from the direct efficacy of legislation. Laws on this subject can be evaded; but they are useful auxiliaries to the many who dislike a most mischievous custom, but have not the moral courage to resist it.

TERRIFIC TORNADO AT CANTON.

[This has been duly reported in our daily papers but it is too important an event not to be put on record by ourselves. We are indebted to the *Hongkong Daily Press* for the following.]

FEARFUL DESTRUCTION OF PROPERTY AND LOSS OF LIFE

ON Thursday afternoon, the 11th April, Canton, Fatshan, and the neighbouring district were visited by a tornado, which in the course of a few minutes laid nearly two thousand houses in ruins, wrecked more than a thousand boats, and caused a loss of life estimated at nearly ten thousand. No Europeans were among the killed. The foreign settlement of Shameen at Canton was caught in the storm, and more than half the houses were unroofed or otherwise damaged, while one-third of the trees were torn up. The granite bridge over the Canal was cleared of its balustrades, the granite seats on the Bund overturned, lamp posts twisted, and every object in the track of the destroyer swept before it. The destruction was strictly confined to the narrow line which marked the course of the tornado, buildings a yard or so outside remaining uninjured. To add to the general confusion and destruction, four different fires broke out in the Western Suburb of Canton simultaneously with the visit of the storm, by which two or three hundred houses were laid in ashes. The excitement caused by this sudden and unprecedented calamity was tremendous. The work of recovering the bodies and clearing away the ruins is still proceeding, thousands having been buried in the ruins of their homes. The loss of property cannot be estimated at present. Below we give full particulars of the disaster:—

[FROM OUR OWN CORRESPONDENT.]

CANTON, Friday Morning, 12th April.

Yesterday afternoon one of the most sudden and alarming disasters that has ever visited this port overtook it. During the forenoon thunder and lightning, the latter of a most vivid description, were experienced, and about two o'clock, it commenced to rain. Between three and four o'clock the sky became intensely black, and hail began to fall, some of the stones being as large as walnuts. An exceedingly high wind came from the South-west, and when opposite Shameen and over Honam it reached the force of a hurricane, which broke the windows and tore off the roofs of several houses in the settlement. Shortly afterwards, a large waterspout was seen coming from a Southerly direction, working its way up the river in a zig-zag fashion, up-turning sampans and other craft, passing over Honam, where it destroyed matted sheds and damaged houses, then turning off to Shameen, where it uprooted trees, damaged the canal bridge considerably, wrecked many and injured nearly all the houses in the settlement. Finally the waterspout broke over the city, wherein great quantities of guns and crackers were fired for the purpose of dispersing it. After the hurricane and waterspout, which lasted only about ten minutes altogether, the scene on Shameen was most deplorable. The little settlement was strewn from end to end with debris of all sorts, most of the houses being unroofed, the trim gardens laid desolate, and the trees being torn down or robbed of their branches. Looking from the settlement on the river, piles of wreckage were to be seen floating, with numerous dead bodies, and from the West a lurid glare caused by a great fire was visible. Half of the houses in Shameen have been rendered uninhabitable, and nearly all have sustained some damage. Messrs. Siemssen's and Messrs. Postau's silk godowns have been completely demolished, and Messrs. Arnhold, Karberg's godown has shared a similar fate. The residences of Messrs. Jardine, Matheson & Co., Wm. Postau & Co., Thomas and Mercer, Gepp and Co., Arnhold, Karberg & Co., and Deacon & Co. have suffered the most, I believe, but others have been damaged to some extent.

In Canal-road great numbers of the houses were blown down, and some of the inmates buried in the ruins. This morning on clearing away the ruins of the house of Tung Cheong, the tailor, the bodies of that well known tradesman and one of his assistants were discovered. The Canal was filled with wreckage, amongst which dead bodies were to be seen in considerable numbers. Inside the city and suburbs almost incalculable damage was done. The natives were in a state of the wildest terror and confusion, and to add to the uproar four different fires broke out in the Western Suburb at about a quarter to four o'clock. How these originated is not known, but it is suspected, and not without good reason, that they were the work of incendiaries, with intent to pillage. At all events, bands of robbers sallied forth to take advantage of the confusion caused by the hurricane and the fires. Efforts were made to stop the course of the fires, but they raged almost unchecked and were not extinguished until this morning, and I fear that several hundred houses were burned to the ground, and large areas are covered with nothing but blackened ruins. Numerous robberies were committed by the scoundrels who

swarmed on the scene. Hundreds of families have been rendered homeless by fire and storm, and great numbers reduced to destitution.

The number of shops and houses damaged or wrecked in the city by the storm is not known, but I am informed by Chinese that upwards of two thousand buildings have sustained more or less injury. The loss of life is variously estimated at from two hundred to five thousand, but I believe that the lower figure is nearest the mark. At present it is impossible to give a good guess, but in any case both the mortality and the destruction to property have been most serious. The suddenness of the disaster of course contributed to the fatal nature of its effect. A good many persons were burned to death in the great fires in the Western Suburb.

I hear that the storm has also wrought similar havoc at Fatshan, but as yet no details have been received.

[FROM OUR OWN CORRESPONDENT.]

CANTON, Saturday Morning.

Since writing yesterday I have been able to gather some further particulars of this unprecedented calamity which has overtaken the City of Rams and the district surrounding it. The loss of life would appear to be very much greater than I first imagined, and it is still very difficult to form a fair estimate, but many hundreds of dead bodies have been recovered from the Canal, the wrecks in the river, and from underneath the ruins in the City. Most of those who were killed met their death through the infliction of a sudden blow by falling timbers, flying bricks, or being upset in boats. Many, as I told you before, fell victims to the great fires in the Western Suburb. Another fire, I must tell you, broke out yesterday morning in Tsoi Lan-street, in the Suburb, and was not extinguished until more than ten houses had been burned down.

I have some particulars to add to the list of damages done in the settlement of Shameen. The German Consulate has suffered considerably, and the British Consulate has not quite escaped. The fine banyan trees, the pride and glory of Shameen, beneath whose pleasant shade the residents were wont to take their constitutional, are sadly thinned, and damage has been done which cannot be repaired in ten years, many of the uprooted trees boasting nearly double that age. Some large trees were carried by the tornado a distance of thirty or forty yards. The granite seats along the Bund have been displaced, but that is a loss easily repairable, as is the destruction of most of the lamps by which the settlement is, or rather was, lighted. The houses and godowns which have been laid in whole or partial ruin will furnish employment for the builders for months, and it will be a long time indeed before the once pretty little Island of Shameen resumes the semblance of its former appearance.

Though the foreign residents escaped without any loss of life or serious accident, there were some few fatalities in Shameen. In the godown belonging to Messrs. Arnhold, Karberg and Co. some coolies were engaged in unpacking goods when the tornado laid the building in ruins over their heads. When extricated only two out of seven or eight were found alive, and one of these survivors died shortly afterwards. There may be some further casualties, but I have not heard of more.

In the Canal more than a hundred dead bodies have been found, and the sights are really sickening. It appears that about twenty streets of houses have been completely swept away, besides a number that were pulled down to stop the course of the great fires which broke out soon after the storm. In reference to those I may mention that they occurred, the first in Sun Tin Ti, the second at Saw I-street, the third at Ha Chun Tong, and the fourth in Hung Yan-lane, all in the Western suburb. None of them were finally extinguished until five o'clock yesterday morning, and this was partly due to the fact that many of the thoroughfares were obstructed by the houses that had fallen. About a score of the robbers who had gathered together to loot the houses were captured and handed over to the authorities, but the majority escaped with their plunder. The Viceroy, in response to a request to that effect from the British Consul, sent a hundred soldiers to protect Shameen, a fact I forgot in my hurry to mention before. His Excellency deserves praise for the promptitude with which he cared for the property and safety of foreigners, and the fact serves to show the contrast to the relations existing between foreigners and the native officials now and thirty-five years ago. But to return to my account of the havoc effected in the city, it is said that about fifteen hundred houses have been destroyed and upwards of a thousand boats wrecked. Some of my native friends compute the loss of life ashore and about at more than ten thousand, but I sincerely hope that this is an exaggeration. There seems no doubt, however, that the dead are to be numbered by the thousand, instead of the hundred, as was at first supposed.

The scene along the track of the tornado is sad and dishearten-

ing. The destruction has proved most complete along its direct line; elsewhere, of course, it is partial. The violence of the wind for the few minutes it lasted was as great as that of the severest typhoon. Granite blocks were lifted from their places and hurled a considerable distance, thick trees snapped in twain like twigs, roofs were lifted bodily, and boats carried far on to the shore. In one case a small boat was actually blown on to the roof of a house in the Tenth Ward.

A row of houses, all brothels but one, forming one side of a short lane in the City, were the scene of one notable catastrophe. The other side of the lane is formed by the sidewall of the Mun Cheong Temple, which is some thirty feet high. This wall gave way to the force of the tornado and fell crashing in upon the opposite houses, the inmates of which, about one hundred in number, were all killed, most of them being crushed to death, and the remainder suffocated. There were no means of exit at the back, and no one attempted to dig the bodies out of the ruins.

Inside the City a dreary spectacle is to be met in the shape of troops of homeless people wandering in a dejected fashion up and down the streets craving charity; while here and there were to be seen groups of injured persons lying down groaning in their pain. On the shore there has been much weeping and wailing, parents bemoaning their lost little ones, children crying piteously for their dead parents. The narrow creek is still partially choked up with debris consisting of broken boats and other wreckage, in which are numbers of dead bodies. In too many instances whole families have been crushed to death in one boat. The supply of coffins is nearly exhausted, and the undertakers are now, I am told, charging double price.

The villages of Pah Hin Hock and Pah Hock Tang, two or three miles to the north outside the walls, were caught in the storm and suffered great damage, many dwelling-houses and other buildings being destroyed and numbers of lives lost. The village across the water opposite to Shameen came in for its share of the disaster also, being partially destroyed.

I hear that, though the whirlwind did not effect so much damage at Fatahan as in this port, it has made severe havoc. It is stated by Chinese who have come from there that not less than two hundred houses have been laid prostrate, while about half the boats in the river there have been wrecked. The loss of life is put down at several hundred. A passage boat coming from Fatahan to this city was, when a short distance off, caught in the tornado and instantly capsized. About seventy of the passengers were drowned.

The Chinese account of the origin of these tornados or whirlwinds is curious though absurd. I will give it as explained to me by a native, but cannot be responsible for any errors in this dragonian story.

A pond on the top of a mountain at Sun Ui, a distance of some eighty miles from Canton, is said to be the haunt of a dragon with a stunted tail, who is popularly supposed to ride upon the clouds and to rule the whirlwind. Once upon the time, more than a hundred years ago, a school-boy named A Tseung, at Sun Ui, when rambling on the hill side, picked up an egg which he took back to school and kept. After a few days a creature resembling a serpent came out of the egg. The lad kept this creature in his drawer at school for some months until one day the schoolmaster noticed it and ordered him to take it away. He accordingly conveyed the serpent (now several feet long) to the mountain and put it in a secluded hole, where he often visited and fed it. Sometimes when the boy could not go to see his strange pet, it came to the school to see him, but the other boys were frightened of it, and told their schoolfellow not to let it come any more. The creature, now grown into a monster, was then kept away by his young patron, who began to neglect visiting it. Several months elapsed and the boy's mother fell sick, and it was said that she could not be cured unless some serpent's liver could be obtained. The boy remembered the serpent, went to see him, and asked the creature to allow him to enter its stomach and cut some of its liver. The serpent distended its jaws and let the boy crawl in and take a piece of its liver, which he took home, and, after boiling, administered to his mother, who immediately derived much benefit from the dose. She persuaded her son to go and try for some more, and the compliant serpent again allowed him to enter its mouth, but this time the boy cut too much and the monster was compelled to shut its mouth and swallow the boy. For having eaten a man, the God of Heaven decreed the serpent could not ascend to heaven. Accordingly the serpent, enraged at being shut out of heaven, comes out every two or three years to disturb the people of the world. The inhabitants of the villages near Sun Ui are afraid to go near the mountain reputed to be the serpent's haunt.

So runs the legend, and it is very much on a par with those

nursery tales which delighted us in childhood, such as Jack in the Beanstalk, &c. The only real marvel about it is that there are people silly enough to believe in such a transparent fable.

I may as well give you a rough translation of a printed sheet which was being widely sold in the streets of Fatahan yesterday. At the top are two rough engravings representing a steamer and a huge dragon. It is as follows:—"This paper has to relate an event which has happened in Canton, the veracity of which cannot be called in question. Suddenly in a moment of time the air became black like inky clouds. This was seen by some Foreign Devils on a steamer. They brought out a thousand-mile glass which can make distant objects perfectly distinct. Through this instrument they witnessed this strange object in the heavens. Directly they saw it, they pronounced it as a being, at once supernatural and terrible. Its head was like the head of a lion, but without horns [the provincial idea is that lions have horns]. Its body had scales and a huge tail like that of a fish. Its legs were over three yards in length and its feet had talons bright like silver. This monster rode away in terrible majesty towards the north-west across Shameen and the Western Suburbs." This they declare was seen by these said "Foreign Devils."

Then follows a description of the desolation wrought by this interesting looking animal, which I need not translate.

THE VOICE OF GRIEF.

O rugged, toilsome path of thorns and briers,
Of weary, bleeding feet—
Peopled with shadows of unrequited desires,
And pleasures incomplete!
Land of unchanging sorrow for the dead
And bitterness of life,
Where noble lives by cruel hands are shed,
To win the field of strife;
Where Pain eternal, like the Alpine snows,
Crowned above men and kings,
Broods dark as night, and from her bosom throws
Her arrows and her stings!
Shall the sweet breath of Summer sweep the earth,
And make it smile with flowers,
Yet leave to man the pestilential dearth
Of ever-withering powers?
Behold how Sorrow, wandering through the world,
Weeps passionate tears of blood,
And Charity upon the stones is hurled,
Crying aloud for good!
The voice of grief pierces the Silent Land,
Where victory is won—
Is there no haven past Time's dangerous strand,
No joy beyond the sun?

YOKOHAMA MARKET REPORT.

FRIDAY, MAY 3rd, 1878.

IMPORTS:—The native paper currency is gradually approaching par, as the tea and silk seasons draw nearer, being as we write quoted at but a trifle over 5 *per cent* discount, a very material improvement from the 10 to 12 *per cent* at which it ruled for so many weeks. But the anticipated deliveries of yarns sold to arrive are not taking place, nor do we anticipate that they will, until dealers are put in funds by the sale of native produce. Meanwhile stocks are large, being estimated at fully 12,000 bales, with a good deal more on the water, and weak holders may be compelled to give way, to the general detriment of the market. A drooping tendency is already apparent, in fact, as will be seen by comparison of our present with our last quotations. On no other staples have we any special remark to make; except to note the sale of 22,000 cases of kerosine oil at \$2.75 which appears to have slightly depressed the market.

EXPORTS:—**SILK.** During the past week very little business in Silk has been transacted and total sales do not exceed 150 shipping bales.

The uncertainty regarding the position of politics in Europe is no doubt the main cause of the stagnation, but in addition it must not be forgotten that owing to the very mixed and diminished stocks on the market, large business would in any case be almost impossible.

Quotations are as follow, but must be considered to a great extent nominal. Total shipments to date 21,014 Bales against 20,364 Bales at the same period last season. Our readers must not fail to note here that, in consequence of many shippers having been making up larger bales, these figures do not show the total increase of our production.

TEA:—We are enabled by this opportunity to report the opening of the Season 1878-79, as during the past week, liberal supplies of New Crop have come in and a considerable amount of business has been transacted.

Settlements of New Crop to date amount to pels. 1750, at prices opening from \$46 to \$57 per pel., but within the last two days, there has been a rapid decline and parcels of fair quality have been bought as low as \$28 per pel.

The P. M. S. S. *China* will take about 3,600 halfchests New Crop and the next steamer the *Oceanic* will probably secure a full cargo.

Prices are difficult to fix, but our quotations on next page will be found about correct.

EXCHANGE:—There no change to notice in sterling rates. A fair business has been done in Bank paper, but only moderate transactions in Private. On Hongkong and Shanghai very little has been done during the week.

We quote:—London Bank, 6 months' sight 3s. 11½d. sight, 3s. 11d. Credits 6 months' sight 4s. 0½d. Documents, 6 months' sight 4s. 0½d. Documents continental, 4s. 0½d. Paris Bank, 6 months' sight 5 00. sight 4 90. Documents, 6 months' sight 5 05. Shanghai Bank Bills, sight 73. Private, 10 days' sight 73½. Hongkong Bank Bills, sight 1½ o/o discount. Private, 10 days' sight 1½ o/o discount. San Francisco Bank sight 95. New York Bank, sight 95. **BULLION.** Gold Yen 391, Kinsatsu 422.

•• The dates of Arrival and Departure of the Mitsu Bishi Company's steamers are susceptible of alteration, consequent on the necessity imposed upon the Company—by its contract—of connecting with the steamers of the Pacific Mail.

•• No days for Arrival or Departure of the Pacific Mail Company's or Occidental and Oriental Company's steamers having as yet been fixed, we are unable to tabulate them. Each separate steamer's departure from her port will be notified in the Table below, and the day of her probable arrival at her destination.

•• Three days are allowed in the P. & O. Company's Schedule for transit of the Mails between London and Brindisi.

•• Two days are allowed in the Messageries Company's Schedule for transit of the Mails between London and Marseilles.

FIRE INSURANCE IN JAPAN.

THE German Asiatic Society is doing most useful work.

We have just published large excerpts from Dr. Naumann's interesting paper on Earthquakes; Herr Greeven, last week, gave us a most valuable one on that dangerous enemy to the silkworm, the Uji, and we are now able to give to the public the first part of an equally important essay by Dr. Mayet. The subject chosen by the learned author is a scheme for an obligatory insurance on buildings in Japan, against the waste of house-property caused by fire, earthquakes, inundations, typhoons and war; and the first part of his paper, which is all that we can find room for to-day, gives us the statistics which enabled him to arrive at an estimate of the damage done yearly by these potent enemies of mankind—with the bare statement of the conclusion at which he arrives:—that a house tax of one *per cent* would suffice to cover the cost of rebuilding all houses destroyed! This is a startling statement to make to a foreign community which is paying, on a class of buildings which, as Dr. Mayet points out, are far less exposed to danger of fire than native built houses, as much as three *per cent* for insurance against fire alone, and one-and-a-half upon stone or brick, almost fire-proof, warehouses. We await, with curiosity, the second part of this essay, which will contain the author's summary of his facts and the arguments by which he supports his deduction, and meanwhile shall perhaps oblige those of our readers who have not the time to read the rather lengthy paper itself, by passing briefly in review so much of it as is now published.

The writer commences by justly terming Fire Insurance an important factor in civilization and a powerful aid to the development of national character and trade; and shows how Japanese commerce and the Japanese people suffer from the want of this portion of the foundation of national welfare; how the impossibility of insuring buildings against loss, by either of the five destructive agencies we have named, makes builders careless in their architecture, frightens away capital from investments in mortgage on house property, enfeebles enterprise and stimulates usury. While, on the other hand, were his proposition for 'collective' and compulsory insurance adopted by the Government, he maintains that a great stimulus would be given to the nation's progress, commerce would be more secure, while credit would command cheap money; encouragement would be given to enterprise, and unproductive hoarding of money would be lessened. If it can be proved to satisfaction that all these benefits accrue from a house-tax of two-pence-half-penny in the pound, while at the same time and for the same pittance, the people's houses are assured against fire, earthquake, inundation, wind and war, and the Government left with a small surplus over expenditure,—Dr. Mayet has made a great discovery which merits the widest publication, and we can easily forgive

his giving to our contemporaries copies of a paper which, strictly speaking, should only have been furnished to this Review, the official English organ of the German Asiatic Society.

He proceeds, then, to compute the number of houses annually destroyed in Japan by fire, earthquakes, typhoons, inundations and war, proposing to compare the sum of these with the total number of houses in the country, and thus to arrive at his percentage. He has various means at his command for assembling his figures. Dr. Naumann and Mr. Hattori have recently furnished him with the necessary information respecting earthquakes, and the War and Home Departments have placed at his disposal a detailed statement of the numbers of houses destroyed last year in Kagoshima, Kumamoto, and other places. The damage done by inundations and gales he has to estimate for, but he appears to do so sufficiently liberally, while for the destruction by fire, the most important division of his subject, he has the very minute records kept by the police. And as not only incendiaries, but people who accidentally and innocently cause fires, are punishable by Japanese law, and in various degrees, according to the amount of damage which results from their carelessness or ill-fortune, it follows that of every fire, its origin, extent, and the loss it causes, record is kept by the police; and as Japan is the most over-policed country in the world, this record is very minute, and probably accurate. Thus we get tabular statements showing:—

"The number of houses burned down, in which the fire originated from known causes.

"The number of houses burned down in addition and in consequence of the former.

"The number of conflagrations put out with the help of the police, without serious damage and which occurred from known causes.

"The number of houses burned down in which the cause was unknown.

"The number of houses burned down in addition and in consequence of the above.

"The number of conflagrations put out with the help of the police without serious damage and of which the origin was unknown.

"The number of houses set on fire intentionally.

"The number of houses burned down in addition and in consequence.

"The number of incendiaries arrested."

and then reports being given for two successive years, 1875-6 and 1876-7, a comparison of percentages can be made which, agreeing so closely as it does, goes far to prove, as Dr. Mayet points out, the trustworthiness of the Japanese statistics.

But though the percentages of fires under each of the nine divisions above enumerated agree very closely for the two periods compared, we find the actual number of fires in 1876-7 nearly double that in 1875-6. This Dr. Mayet accounts for by his next two tables, in which he compares

the weather for 1876-7 with that of the three years preceding it, and shows that it was windier and drier, had a greater number of very cold, very hot, and windy days, and a less number with very damp air, and very rainy, than any other of the compared periods. Hence he draws the correct deduction, that the year was more favourable to fires occurring from accidents, and also to their spread, which is fully proved by reference to his fire tables, where the greatest increase is seen to be in the conflagrations from unknown causes, *i.e.* sparks carried by the wind on to substances made readily inflammable by the absence of moisture.

We need not follow Dr. Mayet, step by step, through every paragraph of his paper. We have written enough, we hope, to show our readers that they will be well repaid for the trouble of examining it minutely for themselves. He painfully accumulates, figure by figure, his *data* for calculation of the destruction by the other four causes, and also the expense of extinguishing fire and the cost of administration of the insurance system he proposes to establish. He then, to enable him to combine these figures of destruction and cost, reduces the latter, a money figure, to houses, taking a very low estimate as a house's value; and thus finally arrives at a total of 65,547 houses as the average annual cost, expressed in houses, of damage by fire, earthquake, gales, inundations and war, the cost of extinguishing and cost of administration. Then, comparing Japan with six European countries, and referring to the census of 1875, he concludes that there are in the country 6,938,255 houses and so ends the first part of his paper by dividing the number of houses destroyed into this, and bringing out a quotient of 0.9477 as his insurance premium: that is, a fire rate of less than one *per cent* on the assessed value of house property. This is quite a startling conclusion, at first sight: but we defer further remarks until we have published the second part of the paper.

THE DISPUTE IN THE SILK EGG TRADE.

ONE of the vices of your average reader of newspapers is that he can seldom be induced to glance at a note, far less to turn a page, to refer to statistics, illustrations, or other means of strengthening or elucidating the main argument of any of those short essays which fill a journal's leading columns. Our own readers may have perhaps detected the fact that this is the *raison d'être* of our 'Editorial Notes,' that having sought to drive into their heads our ideas on any subject in a leading article, we have endeavoured to clinch them, by successive taps, in these isolated paragraphs, which, inserted in the main article, might have constituted digressions, or—it may be—have extended the essay itself to a length, dangerous for a writer who sought to have his writing read. We do not seek to make this a cause of quarrel with the "gentle reader"; as the newspaper is but taken up to fill a leisure hour, exertion of every sort must be spared to him: but to account for the fact that we transpose, to-day, from its proper place in our columns, the following translation from the *Hochi Shimbun*, of an article advocating the limitation by Governmental edict, of the production of silkworms' eggs. It is the second and more important of two essays on the same subject: the first duly appeared, last week, under its proper heading "The Japanese Press," and as the native writer summarises it in his few introductory lines, more detailed reference to it by ourselves is needless. This is what he has to say on the present occasion:—

"In my first article, I slightly attacked the arguments of those who are in favour of free production, and though I am not aware whether they consider themselves entirely defeated or not, I end my attack here, and proceeding to the defence of my own position, will give my reasons for advocating the limitation of production.

"A general who is thoroughly acquainted with the state of his own men, as well as with his enemy's, will gain a hundred victories in a hundred battles; and the same holds good in business transactions. Now, though it is necessary to consider equally the circumstances of the Silk worm egg business at home and abroad; yet as there are many who are well acquainted with its condition at home, I will proceed to give a precise account of its condition in foreign countries, *i.e.* will show how Japanese silkworm eggs are employed in Italy and France.

"We hear that the Italian Government, regretting that it should have to import silkworm's eggs from a foreign country, have notified to the people its wish to produce them locally, and after several experiments had been made in the School of Silkworm Production, the parties interested in the business have formed a Company and established a system, for reproducing eggs from Japanese eggs, and selling them to their countrymen at a low price. And the poorer silk-growers, greatly rejoicing at the establishment of this Company, have been producing silk from these reproduced eggs, instead of from Japan eggs, for two or three years (from 1873 to 1875.) But their quality being of course much inferior to the Japanese eggs, those who have been used to grow silk from Japanese eggs of best quality, decidedly disliked these reproduced eggs, and would not use them at all. As, however, several bad eggs were gradually found in the Japanese cards, those who bought such, altered their minds, and began to take to the reproduced. But then, again, in the year 1875, when the silkworms in Italy were much injured by frost, it was found that those coming from the reproduced eggs were weakly, and mostly died; whereas those from the fresh and good Japan eggs were strong, and mostly lived. From that time, the number of growers who have preferred Japan eggs has greatly increased. But the impression that they should produce things themselves, instead of importing them, is prevalent all over the country, and especially the Silk-egg Reproduction Company regards the Japan egg cards as enemies, and tries as much as possible to oppose their importation. And indeed, in 1877, this Company had so far advanced in the art, that it was able to produce pretty good eggs.

"In France, where the best quality is not always wished for, as was mentioned in my first article on the subject, even the reproduced eggs would be gladly bought, so long as they were cheap. But further, as the demand for France is not great, we need not consider it as of much importance. Our main object should be Italy—but the condition of the trade being as above described, we may conclude that the demand for our eggs from foreign countries will go decreasing, year by year. If, therefore, we wish to keep up the good repute and price of our product, the only means is that we should diminish production and only export those of as good a quality as possible. If, however, free production be allowed, and all silk-growers fill cards, with only a speculative outlook, then, as a matter of course, their number will increase more and more, and their value (and as a consequence, price,) will decrease in proportion. A man always moves according to his own view of profit; disinterested men, who were uninfluenced by hope of advantage or fear of injury, only existed among the elevated minds produced by the feudal system: there are probably none such in the present mercantile community*. But a man who seeks for future benefit, should disregard temporary loss; but he must be clever to foresee and able in judgment; whereas I fear that our silk-producers are men who are only capable of seeking for a benefit which is immediately before them. Such being the case, if every body be allowed to produce eggs freely, loss will result. Is not, therefore, the limitation of production an unavoidable course to take? However, man is a living creature and grows: the fool of to-day may be the wise man of to-morrow. The time may come when the nation is more civilized, and trade more widely extended, and the state of affairs, at home and abroad, come to be better understood by the people. Then, if producers, considering their future benefit, of themselves limit production—then free production may be allowed of course. My position is, that granting free

* The writer is clearly a *Samurai*. He has our fullest sympathy in his remark: there is no doubt that New Japan has greatly deteriorated in all the loftier elements of national character.

"production to be right in theory,—practically it is wrong at the present time. I hear that, in the Silkworm Eggs Business Association, the members who are in favour of free production, though few in number, are vigorously contending against the larger number of those who are in favour of limitation; and, though I am not quite sure with which side the decision will finally rest, as this is a matter of great importance for the future interests of our product, I have thus expressed my views as above, for the consideration of those parties who are actually concerned therein."

We are not greatly interested in the errors of this writer respecting the silk trades of France and Italy: our concern is with his arguments respecting the production of silk eggs in Japan. Here, we more than fully go with him. The publication of this Review was inaugurated by an article upon the same subject, in which we advised silk-growers in Japan to devote their most sedulous care to the improvement of their breed of worms by the process of selection and incubation of only the best eggs;—and to steadily refuse to sell any of their first quality to the foreigner. And we promised them, as a certain and almost immediate result of such a policy, an improvement in their silk, and the speedy establishment of a profitable monopoly for their own special growth, which would be grown solely in Japan, instead of, as now, partially in Italy and France. And, as a corollary to this proposition, naturally came the demonstration that, the price of their special growth being raised, they would get a far greater profit by abstaining from parting with their eggs, than they can ever hope to gain by continuing to sell them.

But from what this gentleman and other native writers in the Yedo press tell us, as well as from our own enquiries on the subject, we learn that the traders in the silk-worms' eggs are not by any means all necessarily interested in the trade in silk. It would appear that this comparatively new trade in egg cards is to a great extent in the hands of a class of speculators, the natural product of a gambling, uncertain, business. And looking over the statistical table which we prepared from the Chamber of Commerce returns, and seeing how the export of cards has varied from a million-and-a-half to three-quarters-of-a million, and the prices from three-and-a-half dollars to eight cents, it is quite credible that this is the case. Such a trade must demoralize those who are interested in it as much as lotteries; and to expect them to care for the interests of the nation, or for the interests of the silk trade, or for anything but the chances and changes of their own market, is to expect far more than can be ever attained. It is very gratifying, though rather surprising, to find that there should still be a majority whose views are embodied in the article we quote, and with sufficient influence in this "Silkworms' Egg Business Association" to maintain the limitation policy. It is probable that this majority is composed of capitalists who are interested in the *bond fide* silk business as well as in the silk egg lottery. But it should be remembered that the tendency of the speculator class is to increase; and to corrupt, moreover, the steady-going merchant; and there is grave reason to fear, that the reverse of the proverb our contemporary quotes may come to be true, and that "the wise man of to-day may be the fool of to-morrow." We have argued often enough against governmental interference with trade; but there are exceptions to even so good a general rule as that Trade should be left free; and if it is legitimate for a government to prohibit trade in a drug which is destructive to the health of its subjects, interference becomes an imperative duty when national morality is threatened. This government has properly refused its sanction to the introduction of the Spanish Lottery system; though a large and certain revenue would accrue to itself from the naturalization of this special method of demoralizing the people. The silk egg trade really appears very little better; as we have

shown—if it does enrich a few lucky gamblers, it has a disastrous effect on the great staple industry of the nation; and we should gladly welcome and support any restrictive measures which the Government may think fit to adopt, should the existing majority of the Silk egg Guild fail in maintaining their ground against those who wish to have what they call a 'trade' entirely free.

TOO late to do more than simply record it, we receive from Yedo the information that the following Notification of the *Daijokuwan* was published on Thursday in the native journals of the Capital:—

NOTIFICATION No. 10, BY THE *DAIJOKUWAN*.

"It is hereby notified that the Notifications
 "No. 19 of the 2nd month of the 7th year of Meiji on the Regulations for Silk worm Egg cards;
 "No. 47 of the 3rd month of the 8th year, and
 "No. 39 of the 4th month of the 10th year, on the alterations in the regulations;
 "No. 32 of the 2nd month 8th year, on regulations for Companies for producing Silkworm's eggs and for the Silkworm egg business Associations;
 "No. 65 of the 4th month of the same year, on the additions to the regulations, and
 "No. 42 of the 5th month of the 10th year, upon the production of first Summer Silkworm's eggs, are all hereby cancelled."

(Signed): SANJO SANEYOSHI,
Daijodaijin (Prime Minister.)

4th day of the 5th month of 11th year of Meiji.

Our correspondent has not had time to furnish us with the necessary translations of the Notifications referred to herein as being repealed, and unfortunately, no foreign journal in Yokohama has kept accurate record of the Government edicts, so that it has been impossible for us to get at this information in time for to-day's Review. But our correspondent writes that from current report he gathers that the Notifications rescinded are of "an interfering or limiting nature." It is most devoutly to be wished that merely the petty supervision of Government over the size and shape and stamps of the cards is withdrawn, and not that the minority in the Silk-Egg Guild has managed to induce the Cabinet to refuse its sanction to the decision arrived at by the most prudent and sensible men in the trade—to limit the number of cards this year to the quite sufficient figure of 1,300,000. Should unlimited production be allowed, the result to the trade cannot fail to be disastrous.

OUR failure to discover, ready to our hand, translations of these Notifications suggests the thought that, for many reasons besides saving trouble to journalists, an authorized Government Gazette, published in Japanese and English, would be a valuable addition to Japanese periodical literature. The time is past when the exhibition of Government or Municipal Edicts upon the wayside notice-boards sufficed for the people, as, in Scotch Highland parishes not many years ago, the church door carried announcements of every event interesting to the parishioners. The *Nichi Nichi Shimbun* is generally spoken of as the Government's organ, but it is merely what in European countries is called semi-official, and there is, so far as we know, no sheet published in Tokio equivalent to the *Peking Gazette*. This is certainly wanted: and as Japan is ambitious to become a great commercial country, it would be to general advantage if such a publication were issued in a dual form:—in the vernacular, and in English, the acknowledged commercial language of the world which mercantile men,—French, German, Russian, &c., understand and use in their daily business. It would probably be advisable to employ an Englishman to edit the English half of the *Gazette*, as—particularly when

dealing with commercial technicalities,—the English of most of the native students of that difficult tongue is not every intelligible; but there is no necessity to create a new post with a large salary to get this duty done: there are plenty of foreign employees already in the Japanese service whose work is not so heavy as to preclude their giving a couple of hours once a week to the revision of translations of this sort. And the number of Notifications issued weekly is never so great, but that every foreign journal in Yokohama could find space to give additional circulation to the intelligence.

The system which obtains in the Presidencies of British India is, that, in the Secretariat, there is an apartment devoted to the use of the English and Vernacular Press. All Government Notifications, immediately they are issued, are laid on the table of this room, and, every morning, a reporter from each of the papers goes thither to take a copy of the documents of the day. The Government Gazette is published weekly. If the Japanese Government would adopt this system, and place its Notifications,—in Tokio in Japanese—in a room of the Office, say, of the Home Department; in Yokohama—in English and Japanese—in the Town Hall, it appears to us that it would, in an inexpensive manner, confer a benefit on native and foreign trade.

YOKOHAMA: SATURDAY, MAY 11, 1878.

DEATHS.

On the 3rd May at Kobe, HERBERT AUGUSTUS STEVENS, a native of Jersey.—aged 31 years.

NOTES OF THE WEEK.

FRIDAY EVENING, MAY 10TH.

THE *China* left for San Francisco on Saturday morning last, and the *Malacca*, with the English mail due in London July 1st, at daylight on Wednesday. The *City of Peking* left for Hongkong yesterday morning, the repairs to her machinery having been completed; and notwithstanding her long detention here in port, there will be no alteration in the time of her departure hence for San Francisco, which was originally fixed for the 2nd proxo. The *Tibre*, bringing the Marseilles mail of the 24th of March is hourly expected. The *Orissa* bringing the English mail of the 29th of March, left Hongkong at 1 p.m. on the 6th instant. The *Belgie* which left San Francisco on the 20th ultimo. is daily expected, the *City of Tokio*, from the same port, left on the 2nd instant and is due to here on the 22nd instant. The China and coast ports steamers have arrived and departed with their accustomed regularity.

To write Notes of anything but of the one absorbing topic, the First Meeting of the Yokohama Jockey Club, would indeed be a waste of work. The Mails having been got rid of with a sigh of relief, and the Mitsui Bishi Company having civilly dispatched its Shanghai steamer twenty four hours ahead of time,—(when will other resident steam-ship Companies be so accommodating!) almost a clear week was left for the spring holiday: cares and business were all thrown to the gentle May breezes, the Bankers closed their doors, the brokers talked of 'hands' and 'inches,' instead of 'eighths,' the collector ceased to trouble, and the debtor was at rest. Everything favoured the Jockey Club for this, its first meeting;—not a hitch occurring to mar its harmony, no bickering of rival Clubs to spoil the sport,—racing certainly, all round, better than anything we have seen for many a long year, a fairly even distribution of prizes, large fields, no walks-over, splendid and exciting finishes, and a deal of heat. And—perfect weather, so soft, so balmy, so sensuously luxurious that it became a joy simply to breathe the perfumed air. Which to choose? The Races, with

their crowd and excitement, their glitter and fun and music of happy laughter:—or to roam yonder, where the long cloud-shadows move statelily along the Oyama range, now casting a purple mantle on a moor, now dulling the gold of the rape fields at their feet, now giving a fictitious tint of autumn to the budding woods of Spring on steep hill side and in deep ravine. Which to choose?

Merry it is in the greenwood,
When flowers begin to spring,
To lie upon the daisied sod,
And hear the Cuckoo sing.

Cuckoo, cuckoo!

He cries, and flies from tree to tree,
O, what a jolly bird is he!

The ringdove through the woodland calls,
Coo, coo! with loving voice;
Whilst honey-throated nightingales

Make every heart rejoice.

Sweet, sweet, sweet, sweet!

They chant from brake and bursting bough;
Warm sunshine gleaming brightly through.

Also at ruddy dawn the lark

Shoots up with warbled song,

And budding grove and dewy park

Ring with his note ere long.

Cheer, dear, dear, cheer:

Come here, ith' clear,

And leave your beds! he, sluttering, cries,

Bidding each nymph and swain arise

To celebrate the Spring.

But the Races occur only twice a year, whereas one can listen to the lark any morning one chooses to get up; a cuckoo clock, aided by a strong imagination and an open window, giving on to a pretty garden landscape, fairly makes up for the absence of the bird,—nightingales are out of the question—this is Musashi, not Hertfordshire,—and, for the ringdove; well we have her, on hospitable owners' luncheon tables, in combination with layers of juicy steak, golden egg-yolks succulent morsels, of ham, all embedded in fragrant jelly and enshrined within the flaky, toothsome crust of pigeon pies. Besides, have we not the ride to the Course, which, by starting half an hour earlier, one may take through rustling fields of bearded wheat, and bosky lanes o'erarched with the sapphire pendants of wisteria blossom, or by hillsides blazing with the wild azalea; a turn of your bridle hand brings you in a couple of minutes within view of the white cliffs of Mississippi Bay, and of those jewel-like islets set in the sparkling summer sea. Turn to approach the Course, and Fusiyaama, a pale blue cloud against a paler sky, suggests less material thoughts, of restful happiness and an eternity of repose. Surely life is worth living in Japan, and seldom so well worth it as in our too brief Spring.

That useful adaptation to man's uses, of a child's go-cart,—the 'jinrickisha'—has somewhat spoilt the pleasures and humours of the road. Of yore, when Yokohama went out of town for its spring or autumn carnival, a crowd of horsemen, with traps of every sort, some extemporised for the occasion, with here and there a handsome 'norimon' or humble, but picturesque 'cango' swept slowly along amid the crowd of natives. Anon, the crowd would have to press to either side and make a lane to give passage to a fire-engine, or a wagonette, or a sample of the 'public spirited' one's omnibuses, dashing along, with as good an imitation of a four-in-hand team as Japan could furnish; and though one was not vividly reminded of the Beaufort bays, or even of a Club drag on Balham Hill;—still, there were the four animals, and there the jolly round red face of a jovial driver, now—alas—'gone over to the majority.' Now—the Japanese 'Pull-man car' is so convenient, so cheap, and saves one so much trouble, that horsemen are rare, carriages only used by ladies, and the eccentric drag is vanished, apparently for ever.

One of the greatest advantages which this meeting has had over most of its predecessors, has been an almost total absence of dust,—thanks, not to an active municipality watering the road, but to most happily timed showers in the early mornings of the race-days. The first day was not quite so fortunate in this respect, and the Course, too, was slightly hard; but the other two were favoured with just sufficient rain to give an exquisite freshness to the gardens of the trim villas which dot the road on either side, to make the road itself agreeable going, and to improve the course into perfection. The attendance was as good as we could hope for, with so many gaps recently made in our social circles by departures,—and with so large a portion of the community disporting themselves at Meanohta and elsewhere in the hills; and the shed called a Grand Stand was comfortably full. Mentioning which, reminds us to petition the powers that

be, when the new Stand is designed, to set apart a pen, up in the roof somewhere, for the representatives of the Fourth Estate, who have now to ply their pencils under circumstances of such difficulty as to render it a wonder that they manage to report at all.

The band of the Russian corvette *Vladnick* on the first day, and the Band of the Japanese Marines on the second and third, discoursed sweet music between the events; a snug little bar, under the Stand, presided over by Mr. Foote, the host of Foote's hotel, gave creature comforts to all hungry and thirsty souls who had not an owner for a friend; the difficult duty of starting large fields of fractious ponies was efficiently discharged by Messrs. Cobden and Glennie; the committee's arrangements were excellent, and their executive officer, Mr. Cruickshank, able and energetic and in both Mr. Fischer and Mr. Kirkwood, the ponies had a judge—'and a good judge too.'

We give below, attached to the official record of each separate race, a slight sketch of each struggle: circumstances 'over which we have no control' compelling us to much abbreviate our notes of the third day's sport:

The twenty-seven prizes run for were divided among ten stables, a very different result to what we have been accustomed to see for so many years, when divided counsels prevailed—and which shows the wisdom of the amalgamation of the rival clubs. Naturally the largest number of prizes fell to the most important stables, the veteran Tartans taking eight, the Baron five, and Mr. John Peel four. Of the separate ponies, *Oyama* was the only one which scored three wins; *Chief Mongolian*, *Allendale*, *Hoolet* and *Sunbeam* taking two races each. A good deal of experience was gained respecting the power and performances of the new class of half-breeds—but our notes are extended already to so great a length that we must defer comment on this, as well as on several other points of interest. If possible, we will have a few lines on sporting matters next week.

YOKOHAMA JOCKEY CLUB.

SPRING MEETING, 1878.

FIRST DAY.—Wednesday, 8th May.

1.—THE TRIAL PLATE.—For China Ponies that have never won a race. Weight for inches. Entrance \$5. One mile. (8 entries).

Mr. John Peel's <i>Gone Away</i>	10st	5lbs...	1
Mr. Toggaw's <i>Brown Satin</i>	10st	2lbs...	2
(late <i>Mongolian Wolf</i>)			
Mr. Fritz's <i>Velocity</i>	10st	8lbs...	3

Vagabond 10st 11lbs, *Telephone* 10st 2lbs, and *Brown Prince* 10st, 5lbs, also ran. *Telephone* gave a good deal of trouble at mounting and at the starting post; but after two attempts, the horses were got off to a good start. *Gone Away* jumped off with a lead, which he never lost, and would have won with great ease, but for a shy at some object in the Japanese crowd halfway up the distance, which nearly brought him foul of *Brown Satin*, who was about two lengths behind him. This almost let in *Velocity*, who was lying third, but *Gone Away* being set going again, won by half a length, Time 2.12½.

2.—THE GRIFFINS' PLATE.—Value \$200. For Japan Ponies, *bona fide* Griffins. Weight as per scale. Entrance \$10. First Pony to receive \$175; Second Pony, \$25. Five Furlongs. (8 entries).

Don Carlos' <i>Admiral Rous</i>	10st	6lbs...	1
Mr. John Gilpin's <i>Petrel</i>	10st	4lbs...	2
Mr. Arda's <i>Saint Elme</i>	10st	4lbs...	3

Sir John with 10st 2lbs (4lbs over his weight) also went for this. The *Admiral* was a hot favourite for this race and the event justified his backers. To a fair start at the first attempt, the four ponies got off well together, except *Sir John*, who lost ground considerably. *Saint Elme* made the pace as fast as he could with *Petrel* well up. At the Yew Trees *Admiral Rous* was let out and went up into second place, challenged *Saint Elme* at the turn, and won as he liked by several lengths, Mr. Herhausen, bringing up *Petrel* with a "Chifney rush" beating *Saint Elme* by half a length for second honours. Time 1.19.

3.—THE CELESTIAL CUP: Presented.—For all Ponies. Weight as per scale. Entrance \$5. Three quarters of a mile. (18 entries).

Mr. Fairplay's <i>Chief Mongolian</i>	10st	11lbs...	1
Mr. Morrison's <i>Allendale</i>	10st	8lbs...	2
Mr. Don Carlos' <i>Oyama</i>	10st	4lbs...	3

Of the eighteen entered for this interesting race, eight faced the starter. *Liddesdale* showed temper at the post, which caused some delay, but at the third attempt, the lot were sent away with an indifferent start, *Grey Friar*, who carried 3 lbs. extra, with the best of it, and *Allendale* last. *Chief Mongolian* then rapidly drew up and raced level with the leader for about three hundred yards, the *Dwarf*, *Liddesdale*, *Skeddadle*, and *Chance* following in a ruck, five or six lengths behind; *Oyama* and *Allendale*, both hard held,

bringing up the rear. The latter pair then went through their horses, *Allendale*, at the trees, leading *Oyama*; and *Grey Friar* having shot his bolt at the distance post, the two drew up to *The Chief*, but failed to head him, as, after a desperate and hard ridden finish, Mr. Fairplay's dun was landed a winner by a head, the same distance separating *Allendale* and *Oyama*, second and third. Time, 1.38½.

4.—THE BANKERS' CUP: Presented.—For China Ponies that have never won a race here up to date of entry. Weight for inches. Entrance \$5. Half a mile. (7 entries).

Mr. Morrison's <i>Allendale</i>	10st	8lbs...	1
Mr. Fairplay's <i>Saltarello</i>	10st	11lbs...	2
Mr. Fritz's <i>Velocity</i>	10st	8lbs...	3

Vanguard 10st 5lbs, *Gone Away* 10st 8lbs (3lbs over) and *Sovereign* 10st 11lbs, also ran; six out of the seven entered. Mr. Fritz and Mr. Fairplay both declared to win with their best. At the second attempt, the ponies got away to a bad start, *Saltarello* leading. *Allendale* immediately, however, went to the front, but *Saltarello* pressed him hard and to the turn the pace was made very fast. Here *Allendale* bolted to the outside rails, *Saltarello* following him as far as the centre of the course, *Gone Away*, too, who was lying third, imitating the bad example. This let in *Velocity*, who ran straight, but was unable to reach the two leaders, Mr. Marlborough, by sheer riding, and unsparing use of both steel and whipcord, landing the favourite a winner by a head. *Saltarello* second, *Velocity* a good third. Time 1.02.

5.—THE TEA CUP: Presented.—For Japan ponies. Weight for inches. Entrance \$5. Half a mile. (13 entries).

Mr. John Peel's <i>Annandale</i>	10st	4lbs...	1
Major Arda's <i>Saint Elme</i>	10st	4lbs...	2
Mr. Weller's <i>Jim Hills</i> (late <i>The Convert</i>)	10st	4lbs...	3

Of the thirteen entered for this, an appearance was put in by nine, the six beaten ponies being *Monarque* 10st 6, *Drift* 10st 2, the extraordinarily named *King All Francis* 10st 4, *Oyama* 10st 4, *Admiral Rous* 10st 6, and *Plover* 10st 2. Don Carlos declared to win with *Admiral Rous* and Major Arda to win with his best.

The large field was got away to a good start, *Saint Elme*, however, securing the best of it. He was ridden hard from start to finish and made it the fastest race of the day. *Annandale* took second place, and nothing else was able to get up, *Admiral Rous* apparently being unable to get through his horses. At the turn he bolted, which lost him the race. *Annandale*, meanwhile, ridden well and with judgment, caught *Saint Elme* a few strides from home and won on the post by a short head, *Jim Hills* securing third place. Time 1 min.

6.—THE PROFESSIONAL CUP: Presented.—For China Ponies. Weight inches. Entrance \$5. One mile and a half. (11 entries)

Mr. Morrison's <i>Hoolet</i>	10st	8lbs...	1†
Mr. Robertson's <i>Dibs</i>	10st	8lbs...	1†
Mr. Fritz's <i>Vandal</i>	10st	5lbs...	3

Bonny Doon 10st 8, *Hah Daiku San* (late *Kingfisher*) 10st 11, *Mongolian Chief* 10st 8, and *Sport* 10st 5, also ran, Mr. Robertson declaring "best to win." They got off leisurely to a good start, *Mongolian Chief*, with *Bonny Doon* in close attendance, leading the field past the stand. *Dibs* and *Hoolet* then closed on the leaders, and *Bonny Doon* was eased going up the hill: at the three-quarter mile post *Dibs* took a strong lead, and the *Chief* falling back was passed by *Hoolet*. From the half mile in, the favourites had the race to themselves, each alternately getting his head to the front, but finishing, after a most exciting and punishing struggle, with a dead heat. *Vandal* a bad third. Time 3.24½.

In the deciding heat, which was run after the seventh race, the two cracks got away on even terms, *Dibs* soon taking a slight lead, which he kept past the Stand and down the hill. Rising up again, *Hoolet* ran up to him, however, challenged, and after a game attempt by *Dibs* to hold his own, passed him and gradually drawing away, came in a winner by three lengths. Time 3.28.

7.—MITSU BISHI CHALLENGE CUP.—Value \$200. Presented by the Mitsu Bishi Company. For Japan Ponies. To be won at two consecutive meetings by the same stable, to be held in the mean time by the last winner. Weight for inches. Entrance \$5. Once round and a distance. (Last winner Mr. Morrison's *Distemper*.) (6 entries).

Mr. Morrison's <i>Distemper</i>	10st	6lbs...	1
Mr. Don Carlos' <i>Kangaroo</i>	10st	6lbs...	2
(late <i>Kickapoo</i>)			
Mr. Fritz's <i>Fleur de Lys</i>	10st	4lbs...	3

Only the three placed horses started, *Fleur de Lys* with a lead, *Kangaroo* next, and *Distemper* held. *Kangaroo* closing on the leader as the half mile post, *Distemper* was now ridden out, and passing *Fleur de Lys*, got up to *Kangaroo* at the distance post, and after one of the most splendid finishes of the day, secured the Cup for Mr. Morrison by the shortest of heads.

8.—THE CONSULAR CUP: Presented.—For all Ponies. Weight as per scale. Entrance \$5. Once Round. (17 entries).

Mr. John Peel's <i>Sunbeam</i>	10st	2lbs...	1
Mr. Morrison's <i>Braemar</i>	10st	8lbs...	2
Mr. Savile's <i>Crusader</i>	10st	5lbs...	3

Of the seventeen entries, eight ponies went to the post, the others than those placed being *Vandal*, with 10st 5, *The Dwarf* 9st 13, *Liddesdale*, 10st 11, *Chance* 10st 2 and *Bravo* 10st 5.

This was the 'surprise' of the day, *Braemar* being made a strong favourite. A most beautiful start was effected and the horses went down the hill in a cluster which a sheet would have covered, *Crusader* leading. Rising the hill *Braemar* wrested the lead from him, but *Sunbeam* was directly afterwards ridden out, and, passing the Tartan crack, was never again approached and won with apparent ease by four or five lengths, as much separating *Braemar* from *Crusader* and the rest of the field. This third and rather unexpected victory for the Blue and Silver was greeted with loud acclamations, and cheers for his popular owner. Time 2.14.

9.—THE ITO CUP: Presented.—Open to Professional Riders For Japan Ponies. Weight for inches. Entrance \$5. One mile. (6 entries).

Don Carlos' <i>Oyama</i>	10st	4lbs...	1
Don Carlos' <i>Kangaroo</i>	10st	12lbs...	2
Mr. Weller's <i>Jim Hills</i>	10st	4lbs...	3

Admiral Rous was the only absentee for this race *Annandale* with 10st 4 and *King all Francis* with the same, going to the post with the above three, Don Carlos declaring to win with his best. *Jim Hills*, who seems fond of a preliminary canter, caused some delay and several false starts; but at last they got away well together; Don Carlos' pair were held to the half mile post, the other three racing level. Here *Oyama* and *Kangaroo* began to creep up and their field falling back to them, had the race to themselves for the last quarter of a mile, *Oyama* winning by a head. Time 2.14.

SECOND DAY.—Thursday 9th May.

1.—THE COMMUNITY CUP: Presented.—For all Ponies. Weight as per scale. Winners of one Race at the Meeting 7-lbs. extra; of more than one race 10-lbs. extra. Entrance \$5. Once Round. (17 entries).

Mr. Morrison's <i>Lintie</i>	10st	2lbs...	1
Mr. Robertson's <i>Dibs</i>	10st	8lbs...	2
Mr. John Peel's <i>Bonny Doon</i>	10st	8lbs...	3

The 'Ladies' day' began with a very fine race. None of the winners of yesterday being able to give away 7lbs to *Dibs*, *Lintie* or *Bonny Doon*, these three were accompanied to the post only by *Vanguard*, 10st 5, *Grey Friar*, 10st 2, and *The Dwarf*, 9st 13, making a field of six out of 17 entries. Mr. Fritz declared to win with his best. *Lintie* was decidedly the favourite for this event. After a few false starts, due mainly to *Vanguard*'s restiveness, the flag fell to a good start with *Lintie* leading, and *Bonny Doon* second, followed by *Dibs* and *Dwarf*, Mr. Fritz's pair bringing up the rear. In this order they past the stand and went down the hill, when *Bonny Doon*, who had had to make the running for himself, was indulged with a pull and dropped back to fifth. *Dibs* now came up through the others and gradually drawing up to *Lintie*, a fine race ensued between the pair, but though the favourite had had about enough of it, Mr. Marlborough was able to get just enough out of him to beat *Dibs* by a head. *Bonny Doon* was a bad third. Time 2.15.

2.—VISITORS' CUP: Presented.—For Japan ponies that have never won a race. Weight for inches. Entrance \$5. Half a mile. (11 entries).

Major Arda's <i>Saint Elme</i>	10st	4lbs...	1
Mr. Peter's <i>Snake</i>	10st	6lbs...	2
Mr. John Gilpin's <i>Petrel</i>	10st	4lbs...	3

Only *Main Chance*, with 10st 6, joined the three placed ponies at the starting post. When the flag fell, *Petrel* was three lengths behind, *Saint Elme* leading. The former, however, quickly joined the leader, but bolting at the Bay turn went out of the race which was left to *Snake* and *Saint Elme*, the former winning easily by a length. Time 1.01½.

3.—THE MERCHANTS' CUP: Presented.—For China Ponies. Winner of No. 6, First Day, 7-lbs. extra. Weight for inches. Entrance \$5. One mile and a quarter. (14 entries).

Mr. Morrison's <i>Braemar</i>	10st	8lbs...	1
Mr. John Peel's <i>Sunbeam</i>	10st	2lbs...	2
Mr. Robertson's <i>Favari</i>	10st	5lbs...	3

As *Hoolet* did not appear, there was nothing in the race to help the handicappers' judgment for to-morrow, *Vandal*, with 10st 5, and *Brown Satin*, with 10st 2, with the three placed horses, gave us a field of five. *Brown Satin* started with a lead, until the pace improved, when he fell back to *Braemar* and *Sunbeam*, who were running level, with *Favari* well up, *Vandal* last; at the three-quarter miles post *Braemar* showed in front, but *Sunbeam* recovered and

improved his position at the half mile, *Favari* lying third, and the rest dropping behind. From here to the turn, the race lay between the two leaders, but here *Braemar*'s superior staying power began to tell, and he came away, winning as he liked, second and third honours remaining with *Sunbeam* and *Favari*. Time 2.58.

4.—THE LADIES PURSE: Presented by the ladies of Yokohama, —For all Ponies. Weight as per scale. Entrance \$5. Half a mile. (20 entries).

Mr. Morrison's <i>Allendale</i>	10st	8lbs...	1
Major Arda's <i>Saint Elme</i>	10st	4lbs...	2
Don Carlos' <i>Admiral Rous</i>	10st	6lbs...	3

This of course was the race of the day, and to contest for the valued prize the largest field of the meeting went to the post, no less than twelve out of the twenty ponies entered facing the starters. On our narrow course and with such animals, and gentlemen jocks, it was not to be wondered at that several false starts took place. When they were at last got away, *Allendale* went off with a slight lead, which he never lost. *Saint Elme*, *Admiral Rous* and *Skedaddle* were, however, in close company with him as far as the distance post, where the last-named fell away, and left the race to the other three. Won by half a length, Mr. Marlborough's riding being much admired. *Admiral Rous* a good third, and *Salterito* within a neck of him. Time very fair 1.02.

Miss Center presented the prize with the usual appropriate congratulation, and Mr. Marlborough replied as well as jockey. generally do when they are hurried out of the saddle for the purpose, after riding a severe finish, concluding by begging the lady's acceptance of a bouquet from the Committee.

5.—THE DIPLOMATIC CUP: Presented.—For Japan ponies. Winners of one race three-quarters of a mile or under at this meeting, 7-lbs. extra. of two or more such races, 12-lbs. extra. Weight for inches. Entrance \$5. Three-quarter of a mile (10 entries).

Don Carlos' <i>Kangaroo</i>	10st	12lbs...	1
Mr. Morrison's <i>Distemper</i>	10st	6lbs...	2
Mr. John Peel's <i>Annandale</i>	10st	4lbs...	3

Of the ten entries for this, only four came to the post—*Annandale* penalized with 7 lbs., which proved too much for him against *Distemper*. *Monarque*, carrying 10 st. 4 completed the field. A capital start was effected, *Monarque* with a slight advantage and *Distemper* waiting. At the trees, *Kangaroo*, *Annandale* and *Distemper* all closed on the leader, who fell back as the turn was rounded into the straight run in, when another good finish resulted in a victory for *Kangaroo* by a short head, with *Annandale* an excellent third. Time 1.41.

6.—THE MITSU BISHI CHALLENGE CUP.—Presented. Value \$200. For China Ponies. To be won at two consecutive meetings by a Poney or Ponies, the *bond fide* property of the same owner or owner to be held by the last winner at each meeting until finally won. Weight for inches. Entrance \$5. One mile and three-quarters. (Last winner Mr. Robertson's *Dibs*.) (12 entries).

Mr. Robertson's <i>Dibs</i>	10st	8lbs...	1
Mr. Morrison's <i>Hoolet</i>	10st	8lbs...	2
Mr. Fred. Mason's <i>Brown Prince</i>	10st	5lbs...	3

Seven started, *Vagabond*, with 10 st 11, *Doncaster* 10 st 8, *Brown Prince*, 11 st (9 lbs over weight) and *Braemar*, 10 st 9, (1 lb over) make up the number. *Dibs* reversed the judge's verdict of yesterday by beating *Hoolet*, and *Brown Prince* showed himself a good pony by running into third place, in spite of his extra weight. The race presented no feature of interest, as *Dibs* at the three quarter mile post took a decided lead, *Hoolet* failed to get up to him. The Cup remains in Mr. Robertson's hands, *Dibs* having won it at the last Autumn meeting. Time 4.7.

7.—THE LUSITANO CUP: Presented.—For Japan Ponies' Weight for inches. Winners of one race at this meeting, 7-lbs. extra, of two or more races, 10-lbs. extra. Entrance \$5. One mile. (8 entries).

Don Carlos' <i>Oyama</i>	10st	4lbs...	1
Mr. Weller's <i>Jim Hills</i>	10st	4lbs...	2
Mr. Morrison's <i>Distemper</i>	10st	8lbs...	3

Only these three started and got away well together. The pace was made too strong for *Distemper*, who had run in the 5th race, whereas the other two were fresh. They raced together nearly to the yew Trees, when *Oyama* came away and won easily, Time 2.19.

8.—HACK STAKES.—For all Ponies not otherwise entered, except for the Hurdle Race, and that have never won a flat race. Weight 12-stone. Entrance \$5. Three-quarters of a mile. (6 entries).

Mr. Alexander's <i>Petit Pas</i>	10st	2lbs...	1
Mr. Morrison's <i>Ironhorse</i>	10st	4lbs...	2
Mr. Hugo's <i>Antelope</i>	10st	4lbs...	3

Bockere (late the *Snark*) was the only other competitor for this race, which was quite uninteresting, *Petit pas* taking a lead at the quarter mile and winning in a canter. Time 1.48.

9.—THE SPRING CUP.—For Japan Ponies that have been beaten at this meeting. Weight for inches. Entrance \$5. Five furlongs. (14 entries).

Mr. John Gilpin's <i>Phoebe</i>	10st	2lbs...	1
Mr. John Gilpin's <i>Petrel</i>	10st	4lbs...	2
Mr. Weller's <i>Jim Hills</i>	10st	4lbs...	3

Drift with 10st 6, (4lbs extra) *King All Francis* 10st 10, (6lbs extra) *Fleur de Lys*, *Monarque* and *Main Chance*, all carrying 10st 6

made up a good field of eight. A great number of false starts took place, chiefly the fault of *Main Chance*: *Petrel* jumped the fence, fortunately without accident to himself or rider. When they were at last got away, *Plover*, *Monique* and *King* showed together in front, but coming into the straight the latter dropped back and gave up his place to *Jim Hills*.

Petrel then ran up into second place, but was unable to do more than reach *Plover's* quarters, who won a well contested race by nearly a length *Jim Hills* third. Time 1.21.

THIRD DAY,—Friday, 10th May.

1.—**THE HURDLE RACE**.—Value, \$75. For all Ponies, over six (6) hurdles. Entrance \$5. One round and a distance. (8 entries).

Mr. Robertson's *Favori*, 10st 5lbs 1
Mr. Fritz's *Vanguard*, 10st 5lbs 2

Favori won easily: a slow race but the fencing very pretty.

2.—**THE OWNERS' CUP**.—Presented.—For all Ponies. Weight as per scale. Entrance \$5. Three furlongs. (19 entries).

Mr. Robertson's *Chance*, 10st 2lbs 1
Mr. Peter's *Skedaddle*, 10st 2lbs 2
Major Arda's *Saint Elme*, 10st. 8lbs 3

Six others run: a close race, *Chance* winning by a short head, the third pony well up.

3.—**THE CHINA CHAMPION STAKES**.—For China Ponies. Compulsory on winners on 1st and 2nd days at this meeting. A Sweepstake of \$10. with \$5 extra for every Race won. Open also to Ponies placed second, at an entrance fee of \$5, to go the Fund. Entries to be made on the Course at the close of the second day's racing. First Pony to receive 75 per cent., second Pony 25 per cent. Weight for inches. One mile and a quarter.

Mr. Morrison's *Hoolet*, 10st 8lbs 1
Mr. Robertson's *Dibs*, 10st 8lbs 2
Mr. Morrison's *Braemar*, 10st 8lbs 3

Four started *Hoolet* winning a splendid race from the second and third.

4.—**THE JAPAN CHAMPION STAKES**.—For Japan Ponies. Compulsory on winners on 1st and 2nd days at this meeting. A sweepstake of \$10, with \$5 extra for every Race won; with \$50 added. Open also to Ponies placed second, at an entrance fee of \$5, to go to the Fund. Entries to be made on the Course at the close of the second day's racing. First Pony to receive 75 per cent., second Pony to receive 25 per cent. Weight for inches. One mile.

Don Carlos' *Oyama*, 10st. 4lbs... .. 1
Mr. Morrison's *Distemper*, 10st. 6lbs 2

Won easily.

5.—**CHINA CONSOLATION**.—For China Ponies beaten at this meeting. Weight for inches. Entrance \$5. One round and a distance. (24 entries).

Mr. Toggaw's *Brown Satin*, 10st 5lbs 1
Mr. Savile's *Crusader*, 19st 6lbs 2
Mr. Fritz's *Velocity*, 10st 8lbs... .. 3

A fast race and the result a 'surprise.' Both owner and jockey of *Brown Satin* received quite an ovation.

6.—**THE JAPAN CONSOLATION**.—For Japan Ponies beaten at this meeting. Weight for inches. (18 entries).

Mr. John Gilpin's *Petrel*, 10st 4lbs... .. 1
Mr. Peter's *Snake*, 10st 6lbs 2
Mr. Fairplay's *Fleur de Lys*, 10st 4lbs 3

Won pretty easily by the favourite.

7.—**THE GERMAN CUP**.—Open to Professional Riders. For China Ponies. To be handicapped by the Stewards at the close of the second day's racing, when entries will be received.

John Peel's *Subearm*, 10st 12lbs 1
Mr. Robertson's *Dibs*, 21st 10lbs 2
Mr. Fairplay's *Chief Mongolian*, 11st 3

A splendid race between the three placed.

8.—**THE AMERICAN CUP**.—Open to Professional Riders. For Japan Ponies. To be handicapped by the Stewards at the close of the second day's racing, when entries will be received. Entrance \$5. Once round.

Mr. Weller's *Jim Hills*, 10st 0lbs 1
Don Carlo's *Kangaroo*, 11st 0lbs 2
Mr. Peter's *Snake*, 9st 12lbs 3

Another beautiful finish and a somewhat unexpected result, as *Jim Hills*, as usual, had misbehaved himself at the post and taken a preliminary canter.

9.—**THE LEDGER CUP**.—Presented.—For China Ponies. Open to Professional Riders. Weight for inches. Winners of one race at this meeting 7lbs, of two races, 10lbs, of more than 2 races, 14lbs extra. Entrance \$5. Three-quarters of a mile. (20 entries).

Mr. Fairplay's *Chief Mongolian*, 11st 4lbs (7lbs extra) 1
Mr. Morrison's *Lintie*, 10st 9lbs... .. 2
Mr. Peter's *Skedaddle*, 10st 2lbs 3

Mr. Fairplay scored another win in this race with *Chief Mongolian*, beating *Lintie* very cleverly by half a length.

A couple of bettors' races, won by *Kangaroo* and *Skedaddle* respectively, finished this most successful Meeting.

COLLECTIVE INSURANCE OF BUILDINGS IN JAPAN.

(A paper read before the German Asiatic Society—April the 13th 1878. By P. MAYET.)

THE following paper deals with the average yearly destruction of buildings in Japan by fire, earthquakes, gales, inundations and war, combined with a proposition for an obligatory insurance of buildings against all these risks, in order to render property secure and to enable mortgages to be made with safety and at a low rate of interest.

The importance of insurance in the development of civilised nations can scarcely be overrated. As a proof that I am not alone in attaching so much weight to this subject I will quote from one of our best known authorities on the subject of insurance. The Right Honorable Jacobi, a member of the Prussian parliament, and who was appointed in 1869 by the Committee of Commerce and Industry as the referee concerning the two bills proposed by the Prussian government regulating the entire insurance system of the country, wrote as follows*: "Fire insurance at the present time, constitutes one of the most important parts of the basis of our commerce and industry, of the welfare of every individual in town and country, from those dwelling in hovels to those who luxuriate in marble palaces, from the keeper of the smallest stall to the manager of the largest merchant's office and to the owner of the most extensive warehouses, from the journeyman workman to the largest manufacturer. If we imagine for a moment that this foundation on which our national welfare rests, is shaken or even only trembles, commerce and industry would be seriously paralyzed, bringing about a calamity which would be deeply felt throughout the country."

Japan is in want of this foundation for its national welfare, Japanese commerce and industry are seriously paralyzed, the want of a fire insurance is a real national calamity.

Without a system of fire insurance, no Japanese can feel sure of his property for a single day: it is as if no police, no armed force existed in the country, while numerous hordes of brigands scourged it from North to South, looting all property in their pitiless raids:—these latter could scarcely pillage as many tens of thousands of houses, as the flames do in their yearly course.

But this is not all. Other great dangers arising from causes, it is true, of a longer periodicity and therefore not always so present to the mind, but none the less dreadful in the results they produce, menace the prosperity of Japan: terrible earthquakes destroy whole towns, and with earthquakes roll in vast waves from the sea, sweeping off whole villages from the coast; ravaging typhoons leave destruction in their rear, and war and revolution devour villages and towns.

No wonder that the spirit of enterprise is feeble, that no one will build good houses for the fire to feed on and the earthquakes to sport with, that manufactories are not erected and no money risked in worthy enterprise, that usury laws become necessary, to limit the rate of interest asked for insecure mortgages on houses, wares and machinery.

A collective insurance against all the above named risks would change at once these conditions; it would add to the value of the title deed of every property in Japan, and would enable trustworthy merchants and men of enterprise to obtain cheap credit. How many resources would then be developed, how many now impossible schemes would start into life! Each existing trade would be developed and be placed on a safer basis; the industries would grow, and with them the capacity of the country to export.

But it may be asked, are we not building castles in the air, which vanish at the first attempt to touch them? Is collective insurance against all these risks combined, or even only a fire insurance, possible? Would not every Japanese, deterred by the high rate of the insurance premium, rather prefer to run the risk, and hope that he might escape safely, and be always among the luckier ones? Would not the minimum insurance premium necessary to be levied be altogether beyond the means of the people?

*Die Zeitschrift des K. Preuss. Statistischen Bureau. Ergaenzungsheft II. Beiträge zur Gesetzgebung ueber des Versicherungswesen im Allgemeinen und das Feuer-Versicherungswesen insbesondere. Von L. Jacobi Koenigl. Geh. Regierungsrath Berlin 1869 p 15.

To give a contribution to the data necessary for deciding a question of the utmost importance to the future welfare of the Japanese people has led me to make the following investigation, which I now have the honour to lay before you, regarding the minimum insurance premium rendered necessary by the conditions of the country.

Therefore this paper deals with the average number of buildings which are yearly destroyed in Japan. Complete records are obtainable for at least one, and that by far the most important—fire—of the five agents, which work destruction among the houses of this country.

As regards the destruction brought about by movements of the earth, Dr. Naumann has recently, in his highly interesting paper on earthquakes in Japan, communicated to this Society, and subsequently Mr. Hattori, in a paper read before the Asiatic Society of Japan, supplied the necessary data for allowing an approximate estimate to be made. As regards the damages done by gales and inundations, where these do not accompany earthquakes, the returns are still less precise. Vast as may be the damage caused in any single instance by gales and inundations, even when unaccompanied by earthquakes, still it will be quite obvious, that on the whole the destruction attributable to earthquakes greatly exceeds that resulting from gales and inundations. Therefore, if I take the destruction due to these two causes as equal, I shall be exaggerating rather than underrating. For the number of buildings destroyed by war and insurrections, the results of the late rebellion offer some assistance.

We will then compare the number of houses destroyed yearly by these five active causes with the total number of houses existing in Japan, and from this calculate the average relative destruction. Under the hypothesis that the average value of all houses destroyed or not destroyed is the same, the proportion that the number of destroyed houses bears to the number of undestroyed enables us directly to determine what percentage of the value of the houses must be paid as a yearly premium, to enable a collective insurance to be commercially successful. You will be astonished to find how small would be the premium, were there a general obligatory insurance.

Various reasons given at the end of the paper, lead me to suggest not a private insurance, but rather a house duty for Japan, as an equivalent for which the government pledges itself to make good all damage done to buildings by the above mentioned causes.

I.—THE DESTRUCTION OF BUILDINGS BY FIRE IN JAPAN is to be found recorded in the hitherto unpublished police reports compiled by the Home Department for the whole of Japan, and which have been kindly placed at my disposal. To these police reports, for several reasons an important and interesting production of Japanese statistics, I will take the liberty of drawing your attention in a future paper. For my present purpose, I desire only to employ the nine points concerning conflagrations in these reports. The Japanese police force is actively interested in conflagrations, since not only incendiaries, but even those who unintentionally cause fire, are people to be arrested and punished. If the house accidentally set fire to is uninhabited, the persons receive 10 days' imprisonment with hard labour; if it is inhabited and the fire be produced by the proprietor, then he is punished with 20 days; if by the tenant, 30 days; if the fire spread to other houses the sentence is 40 days, and when any body is killed thereby, one degree heavier; but if the person killed is a relative of the first degree, the punishment is 100 days; if the house belongs to the Government 100 days; if a temple, from sixty days to one year, but ten years are inflicted if it happens to one of the great temples of Ise, or in the precincts of the Imperial palace. If a robber sets fire unintentionally to a house, he is punished with at least three years' imprisonment with hard labour. Decapitation awaits incendiaries, ten years' penal servitude an attempt at arson; the punishment being mitigated if the would-be incendiary is a servant who has just received a sharp rebuke, or if the attempt be made on an uninhabited dwelling. If a man set fire to his own house, ninety days, but if the fire spread to houses in the neighbourhood two years and a half; but penal servitude for life is inflicted, if the offender profits by the opportunity of the fire to purloin goods or property.*

* A Summary of the Japanese Penal Codes: by J. H. Longford Esq. p. p. 91-93.

The police reports therefore are divided into four chapters as follows:—

- a. robbery and thefts;
- b. arrests;
- c. accidents and occurrences;
- d. successful acts of the police;

and refer to:

1. The number of houses burned down, in which the fire originated from known causes.
2. The number of houses burned down in addition and in consequence of the former.
3. The number of conflagrations put out with the help of the police, without serious damage and which occurred from known causes.
4. The number of houses burned down in which the cause was unknown.
5. The number of houses burned down in addition and in consequence of the above.
6. The number of conflagrations put out with the help of the police without serious damage and of which the origin was unknown.
7. The number of houses set on fire intentionally.
8. The number of houses burned down in addition and in consequence.
9. The number of incendiaries arrested.

The reports run from the 1st July to the 30th June: that for 1876-77 containing a comparison, showing the excess or diminution under each head, which latter is not given in the report for 1875-76. We may therefore conclude that there were no earlier police statistics. The total number of conflagrations and of houses burned down is not given as a single item in the police reports, but the information is scattered over the different chapters above referred to. Moreover there is no percentage comparison.

THE NUMBER OF CONFLAGRATIONS.

	1875-76	1876-77
1.—Accidental, origin known	4,066	7,252
2.—Do. do. put out by the police...	410	909
Total number of conflagrations with known origin	4,476	8,161
3.—Origin unknown	1,506	2,937
4.—Do. put out by the police...	245	762
5.—Cases of incendiarism	587	263
Total of doubtful cases and those arising from incendiarism...	2,338	3,962
Grand total	6,814	12,143

It will be observed that a decrease occurred only in the number of conflagrations which are numerically of the least importance, namely the detected cases of incendiarism. But in all the other cases there was an increase, and I may say such a large one, that it might seem to be nearly abnormal, or that the published list could not be relied on. Now is this the case?

A glance at the percentage value of the single items shows in all cases such a wonderful equality, in the different kinds of conflagrations for both years, that this equality alone must speak for the trustworthiness of the table.

CONFLAGRATIONS IN PERCENTAGES OF THE TOTAL NUMBER.

	1875-76.	1876-77.
1st Accidental, origin known	59.67	59.72
2nd Put out by the police, origin known	6.02	7.49
Total number of conflagrations with known origin...	65.69	67.21
3rd Origin unknown	22.10	24.35
4th " put out by the police	3.60	6.27
5th Cases of incendiarism	8.61	2.17
Total of the doubtful cases and those arising from incendiarism	34.31	32.79
Grand Total	100.00	100.00

The general similarity of the percentages noticed in the above table for these two years is in itself a sufficient proof of its trustworthy character.

Let us now turn our attention to the increase in the respective items, and it will be easy to see, that the numbers divide themselves into two groups having wholly different reasons for their respective increments.

THE INCREASE IN THE NUMBER OF CONFLAGRATIONS.

	Absolute increase of the fires.	Increase per cent. compared with 1875-76.
1.—Accidental fires with known origin.	3,186	78.36
2.—The same put out by the police	499	121.71
Total of these conflagrations	3,685	82.33
3.—Fires with unknown origin	1,451	96.35
4.—The same put out by the police	517	211.02
Total of these conflagrations	1,968	112.28
Total of conflagrations with known and unknown origin.	5,653	90.78
5.—Fires occasioned by incendiarism...	324	55.20
Grand total	5,329	78.21

In the above table, the greatest deviations are noticeable in that group of items, the number of which is influenced by human premeditation and activity: that is, setting houses on fire on the one hand and putting them out on the other. The increase of fires extinguished by 121 and 211 per cent, and the diminution in the number of acts of incendiarism by 55 per cent, are tests of the progressing development of the police system and the means for the extinction of fires.

As a proof that the working of the police was much more effective in 1876-77 we may observe another prominent fact: namely, that the number of incendiaries arrested has increased from 127 to 149, so that while with 587 acts of incendiarism in 1875-76 only about 1/5 or 21.63 per cent were arrested; in 1876-77 on the other hand with only 263 incendiary fires, more than half of the incendiaries or 56.65 per cent were captured.

Now with the second group, which we have not yet considered, what is the cause of the large increase in the total number of conflagrations of known origin, by 82.33 per cent; of the total number of conflagrations with unknown origin by 112.28 per cent; and of the total of known and unknown origin together, excepting those caused by incendiaries, by 90.78 per cent? What is the reason for this approximate doubling of the number of conflagrations? and why has the number of conflagrations of unknown origin increased by 112 per cent, while those of known origin have only increased by 82 per cent? The answers to these questions I find in the great climatic difference between the years 1876 and 1877.

But before enlarging on this difference, I must ask you to excuse the somewhat elaborate way in which I am compelled to take up the question; but I feel sure you will give me your forbearance when you remember that, should I succeed in establishing a connection between the number of conflagrations and the weather, we should be led to conclude that in those years in which the conditions were most favourable to conflagrations, there would be found the greatest number of fires. Now to recognize these maximum years would obviously be of the greatest importance, in determining the rate of the insurance premium.

The condition of the weather has a much greater effect in this country on the origin of fires than with us, because the closing of the houses against the weather is not so complete in this country. Here in Japan, no stove, nor mass of heated air confined in the room keeps out the cold, but only a more extensive use of the open charcoal brazier; the wind if strong enough, blows through the whole house and can whirl up the sparks from the *hibachis* and from the open fire places that are let into the floor between the mats, or can set a little tobacco ash glowing. And in addition to this, the fatal custom of every one having at his side, when at work in the open air, a fire for warming his tea or lighting his pipe, often in dangerous proximity to buildings, gives to every blast of wind as it sweeps along over the whole of Japan, ample opportunity to whisk up a considerable number of sparks from the several millions of burning fires and little heaps of still glowing ashes and to whirl them on. If there is much dampness in the air the sparks are quickly extinguished; the oftener rain has fallen and wetted every thing, the seldomer will the sparks set fire to what they fall on; but excessive heat will dry up every thing, and make it ready to kindle. Heat and cold, the velocity of the wind, the amount of damp and rain, are all variable quantities for the different years, and therefore the number of conflagrations will vary with them. Days which are very cold or very hot, or very windy, or very dry, favour the commencement of fires.

A comparison of the two years 1875-77 is fortunately rendered possible by the excellent and complete observations made daily by Mr. Knipping, which were kindly placed at my disposal, for that period, not yet published in the "Mittheilungen der Deutschen Gesellschaft fuer Natur und Voelkerkunde Ostasiens."

We find

For the period:	In Average.			The n'ber of days with.				
	Velocity of the wind in English miles.	The dampness of the air in per cent.	Rainfall in Paris lines.	32° F. and less.	77° F. and more.	Velocity of the wind more than 100 E. m.	Dampness of the air 90 o/o and more.	100 Cubic inches of rain fall and more.
July 1st 1875 to June 30th 1876...	85.24	76.38	924.47	66	76	104	50	41
July 1st 1876 to June 30th 1877...	105.78	74.16	626.99	80	105	172	34	24
1877 was thus ...	windier	drier	drier	had more cold	more hot	more very windy	less very damp	less very rainy

the preceding year. It was in every respect then more favourable to fires, and the numbers which point out its favouring qualities I have made prominent in the above table. So it is at least, for the observations for Tokio, and if it be remembered that the dry character of the year 1877 was spread over a wide area of the Asiatic continent, causing famines there, we may fairly conclude that somewhat the same results would have been obtained if the observations had been extended over the whole of Japan.

Not only did the year 1876-77 favour the origin and spreading of conflagrations more than the year 1875-76, but also more than any of the two other preceding years, for which equally complete observations (with the exception of the anemometer observations for 1873 to March 1874) exist.

For we find

For the period:	In Average.			The n'ber of days with.				
	Velocity of the wind in English miles.	The dampness of the air in per cent.	Rainfall in Paris lines.	32° F. and less.	77° F. and more.	Velocity of the wind more than 100 E. m.	Dampness of the air 90 o/o and more.	100 Cubic inches of rain fall and more.
July 1st 1873 to June 30th 1874...	98.32	75.47	868.86	53	90	150	52	29
July 1st 1874 to June 30th 1875...	94.80	74.36	638.58	69	79	145	35	24
July 1st 1875 to June 30th 1876...	85.24	76.38	924.47	66	76	104	50	41
July 1st 1876 to June 30th 1877...	105.78	74.16	626.99	80	105	172	34	24
The year 1876-77 was thus... ..	windier	drier	drier	had more cold	more hot	more very windy	less very damp	less very rainy

any of the three preceding years. In fact with reference to these qualities it was a year in which there

* 98.32 is really the average of the velocity of the wind measured in English miles for the four months March, April, May, June 1874, but as there are no records of anemometer observations for the preceding eight months, I have taken the above number as representing the average for the whole year.

† From July 1873 to the end of February 1874 the strength of the wind was divided into four degrees by the effect it had on the trees, and it was considered to be of degree 3 and 4 for 70 days, but for the four months March to June 1874 these estimates which gave 30 days of strength 3 and 4 of the wind, were supplemented by records of the anemometer observations giving 45 days with a velocity of more than 100 English miles. As therefore for the whole year the eye estimates give 100 days with the wind strength 3 and 4, we may assume that the anemometer would have recorded about 150 days with strong wind.

were a maximum number of meteorological conditions favouring fires.

Therefore we shall certainly not underestimate the necessary value of the premium, if we take the number of conflagrations and the damages done by them during this year as a standard for calculation.

Now since at single fires there are destroyed hundreds and sometimes thousands of houses, so the question now arises how many houses were burned in the fires which occurred in the years July 1875 to July 1877, and whether the number is so large that the minimum insurance premium necessary to be paid would be beyond the means of the people? We arrive at the opposite conclusion.

THE NUMBER OF BUILDINGS DESTROYED :

	In 1875-76.			In 1876-77.		
	At Fires.	Number of Buildings.	Thus houses per fire.	At Fires.	Number of Buildings.	Thus houses per fire.
1.—Accidental with known origin.	4,066	4,066		7,252	7,252	
In addition and as a consequence		13,308			16,073	
2.—Put out by the police	410			909		
Total of fires with known origin	4,476	17,374	3.90	8,161	23,325	2.97
3.—Origin unknown	1,506	1,506		2,957	2,957	
In addition and as a consequence		2,432			17,455	
4.—Put out by the police	245			762		
Total of fires with unknown origin	1,751	3,938	2.25	3,719	20,412	5.50
5.—Acts of incendiarism.	587	587		263	263	
In addition and as a consequence		201			85	
Total of incendiary fires.	587	788	1.34	263	348	1.32
Grand total	6,814	22,100	3.24	12,113	44,085	3.63

The above table shows that although the climatic conditions of the year 1876-77 were favourable to fire, there was in the average number of houses burned down in each conflagration:

- A decrease from 4 to 3 houses in the fires of known origin.
- An equal destruction of $1\frac{1}{2}$ houses by acts of incendiarism.
- Only a small increase from $3\frac{1}{4}$ to $3\frac{3}{4}$ in the total of all; thus furnishing a further proof that for the year 1876-77 there have been on the whole a better organisation of the police and improvement in the methods employed in extinguishing fires.

It is only in one item—the fires of unknown origin,—which are usually produced by the undisciplined forces of nature, and for which we had also found above the largest increase in the number of conflagrations, namely 112 per cent—that the number of houses per fire is in proportion to the very favourable conditions of this year; this ratio having increased from $2\frac{1}{4}$ to $5\frac{1}{4}$.

The final result for this year, in which there were the maximum number of conditions favouring fire, is that the total number of houses destroyed was 44,085 instead of 22,100; or had doubled. In order to be on the safe side in our calculation, at the end of the paper we shall take this maximum number of 44,085 as our yearly average.

II.—THE DESTRUCTION OF BUILDINGS BY EARTHQUAKES.

In the present century we find recorded the largest number of earthquakes. Within a period of 77 years in the 19th century there were no less than 16 destructive earthquakes or one every 5 years. In this number, however, there were only four of the first magnitude (1830, 1847, 1854, 1855), or one of the first magnitude for every 19 to 20 years. Two of these latter (1854, 1855) were accompanied by very high tides.

One of the most destructive earthquakes, mentioned in the chronological report of Dr. Naumann, which extends

over twelve centuries, is that which occurred in Yedo in the year 1855 and during which there were thrown down

14,241 houses inhabited by single families
1,303 " " " different families
1,649 fire proof storehouses

making 17,193 buildings altogether. In addition to these, others were burned down in Tokio and thrown down in the Nakasendô and Tôkaidô. The number of which, for the purpose of getting the total as a round number may be taken

as 2,907

Total 20,000 buildings.

If in every tenth year such an enormous earthquake were to take place as that which occurred in Tokio in 1855—an assumption which is certainly exaggerated, since in the 1200 years included in the earthquake record for which we are indebted to Dr. Naumann, we find only a few of equal intensity—there would be only an average of 2,000 houses a year destroyed.

Now to be on the safe side we will assume that every tenth year an earthquake occurs as destructive as the great Yedo earthquake, that is, we will assume an item of 2,000 houses as annually destroyed by earthquake.

III.—THE DESTRUCTION OF BUILDINGS BY GALES.

is in Japan quite inconsiderable.

No communications relative to damages by gales were to be found in the earlier police reports, but the most recent one for Tokio for the last year, is superior in this respect, that it contains information regarding the number of houses blown down. And this number was only 20 for the whole year, stormy as it was.

Dr. Hepburn, in his Meteorological Tables * for the period 1863-69 incl : for Yokohama says: "It is from the S. W. that the cyclones almost invariably come, with one and sometimes two of which we are visited yearly."

Dr. Geertz says with reference to the year 1872 †: "In Nagasaki no typhoon occurred during 1872."

Also Mr. Knipping's observations from December 1872 to December 1877 record a very limited number of typhoons. Therefore we must conclude that not more than two typhoons may be expected yearly and certainly these are not so violent that a reporter with any pretensions to veracity could write of them as did the correspondent to the New York Herald regarding the gale near Philadelphia on the 1st September 1877, that it lifted up a fat gentleman who was out walking and deposited him two English miles further on in his course; since this terrible storm only deprived eight families of their dwellings, so that you will not accuse me of want of liberality if I allow for each of the two yearly typhoons a destruction of 250 houses,—that is, if I put down 500 houses as the yearly loss from windstorms.

IV.—THE DESTRUCTION OF BUILDINGS BY INUNDATIONS

can only be found vaguely estimated. That, however, inundations occur with comparative regularity may be seen from the Reports of the Ku and Ken ‡ regarding their special expenses.

These expenses were for 1873 Yen 131,990
" " 1874 141,195
" " 1875 196,082

Total.....Yen 469,267

the yearly average therefore being 156,422 Yen.

Whether the inundations are due to swollen rivers or to extraordinarily high tides cannot be determined from the reports. In the same way we cannot decide if any houses at all were destroyed. Probably we may imagine that they were river inundations, unaccompanied by the destruction of houses. But on the long expanse of coast line which Japan possesses, damages to coast villages by high tides are not at all rare. For instance only last year damage was done on the east coast from the Hakone pass to Iwakado.

* Transactions of the Asiatic Society 1874 p. 245.

† Do. Do. Vol. III Part II p. 80.

‡ Meiji roku nen Nihon Fûken Mimpi Hiyo.

" shichi " " " " "
" hachi " " " " "

As regards damage done by sea waves when accompanying earthquakes, this has already been taken into account in the statistics of the injuries caused by earthquakes; and we have now only to consider sea waves which did not follow earthquakes. In the last 90 years I find 5 great tides, not including that in 1877, or 6 altogether, that is an average of one great tide in 15 years. "In 1787 a great flood swept through the Kanto, which resulted in a terrible famine in following years, during which many persons perished. In the years 1836 and 1837 the middle provinces of Japan suffered from a like cause. Similar calamities took place in 1868 and 1869 in the provinces of Oshiu and Dewa." *

If we now assume for the above mentioned 15 years a destruction of 475 villages each containing 80 houses,—a supposition which appears to be needlessly exaggerated—we should have for the 15 years 80 times 475 or 30,000 houses, that is 2,000 houses a year, a number exactly equal to that stated above, of the houses destroyed by earthquakes.

V.—THE DESTRUCTION OF BUILDINGS BY WAR

is in Japan, in consequence of the method of fighting, greatly in excess of similar losses in Europe. A general who will cover his retreat, burns up without hesitation, the towns in his rear, for the purpose of delaying the advance of the pursuing enemy. Another burns for the purpose of cutting off supplies from the foe or to deprive him of shelter, as General Tani, the commander of the fortress of Kumamoto did to the surrounding town. Fire is also resorted to, to drive the enemy from the protection offered by houses. War is war; the main object is victory; if the Imperialists had been worsted, far greater misfortunes would have befallen Japan than the mere loss of some tens of thousands of houses. The generals did their duty as soldiers and it is not for us, who sit quietly at home in our parlours, to reproach them for it. Subsequently the government mitigates misfortunes arising from war by charitably distributing large sums of money to those in distress. During the ten years that have elapsed since the restoration, Japan has witnessed several insurrections, not to mention lesser revolts of the peasantry; namely the rebellion in Saga 1872, in Kumamoto and Hagi, 1876, and in Satsuma, 1877. That such a mighty historical revolution, as we live in here, has encountered so little armed opposition, is a subject of greater wonder than that there has been any spilling of blood. Up to this time the Government, representing the true benefit of the whole nation, has always come out victorious from these selfish provincial struggles. The perfection with which the organisation of centralized government does its work, is best seen from the fact that within two months from the outbreak of the Satsuma rebellion nine army corps were transported across the sea and put into the field. According to a trustworthy official report, hitherto unpublished, the Imperial force in Kumamoto ken amounted to 123,891 men, including the train of coolies for carrying provisions and ammunition.

The power of the central Government is steadily progressing and developing, in consequence of having accepted for its military organisation the principle of general liability to military service, which was formerly only a Prussian institution; and it is already so powerful that the rebellion of any province has not even the slightest prospect of success. The insular situation of Japan delivers it from the dangers of less favourably situated countries; it has the most friendly relations with foreign powers; and therefore is to be supposed that the destruction of houses by war will become less. But predictions based on war and peace frequently prove delusive, and it is therefore only the duty of a careful calculator to make provision for the destruction likely to be occasioned by war.

Let us then take the last rebellion of importance as a basis. The war raged chiefly in the *kens* of Kumamoto, Kagoshima, Miyazaki and on the borders of the Oita *ken*. I have the statistics of the destruction occasioned by the war in the *ken* of Kumamoto from February the 15th to June the 21st 1877.

15,119 houses were burned down
1,936 " " destroyed by shells

making a total of 17,055 houses.

* *Nichi Nichi Shinbun* 26th March 1878. See Japan Weekly Mail 1878 p. 269.

The donations of the Government to the proprietors amounted to..... *yen* 527,271 for houses burned down, and to " 72,651 " " destroyed by shells or pulled down, making a total of... " 599,922

or an average of ... " 35.17 per house.

In the other *kens* above mentioned, the war lasted till the 21st of September, and the destruction of houses seems to have been still greater than in the Kumamoto *ken*. According to the *Hochi Shinbun* (October 1877) 500,000 *yen* were placed at the disposal of the Governor of the Kagoshima *ken* to render assistance to the impoverished inhabitants and to rebuild the most necessary government buildings up to the 1st of September, when Saigo returned to Kagoshima. After the return of the rebel leader, according to the *Nichi Nichi Shinbun* (January 1878), an additional sum of 725,130 gold *yen* was sent to the Governor to be applied to the assistance of the unhappy people of Kagoshima, without distinction of party. The total amount of assistance, exclusive of the sums devoted to the rebuilding of Government Offices, bridges &c., may therefore be estimated at one million *yen*. A portion of this sum may have been applied in rendering assistance otherwise and to the purchase of charcoal, rice and beans, as in Kumamoto. At least a table of Statistics, compiled in the "Shamukioku," (Bureau for miscellaneous matters in the Naimusho), and which has not yet been published, gives a smaller sum, namely 657,738 *yen*, as the amount applied for the building of houses. For this sum, houses and *koyugake* (straw and wood huts), were built and indeed, more of the latter than there were formerly houses, because where formerly several families lived in one house, each one now received a hut.

There were rebuilt :

		hence at the rate of	
In Kagoshima			
town	9,630 houses for <i>yen</i> 420,148.	<i>yen</i> 42.43	p. house.
" Villages ...	2,549 " " " 76,670.	" 30.08	"
" Kagoshima			
town	16,382 huts " " 146,787.5	" 8.96	p. hut.
" Villages ...	2,774 " " 14,132.5	" 5.09	"
Total	31,335 houses & huts <i>yen</i> 657,738.	<i>yen</i> 20.99	p. house

The total of the rebuilt houses was therefore 12,179
And the total of the huts built 19,156

Total 31,335 houses & huts

If we assume that the inhabitants of every three new huts lived before the war together in one house, we arrive at the conclusion that the corresponding number of houses before the war was 6,385. In this case the total loss in Kagoshima *ken* (in the two provinces of Satsuma and Ozumi) would amount to 12,179 + 6,385 = 18,564 houses.

For the Miyazaki *ken* and the borders of the Oita *ken* we have as yet no information. Let us, in order to arrive at a round number, take the arbitrary number of 14,381 houses as destroyed there and we arrive at the total destruction of houses caused by the Satsuma rebellion at 50,000, namely :

In Kumamoto *ken* 17,055 houses.
" Kagoshima *ken* 18,564 "
" Miyazaki and Oita *ken* about 14,381 "

Total about..... 50,000 houses.

In the Satsuma insurrection there were then about 50,000 houses destroyed; certainly an earnest warning against the burning down of villages and towns, in any except the most extreme emergencies.

If we remember that besides the Satsuma rebellion during the 10 years which have past since the restoration, the Saga, Kumamoto and Hagi insurrections, as well as several incendiary revolts of the peasantry have occurred, it will not seem exaggerated if we assume that 65,000 houses were destroyed in the last ten years, that is an average of 6,500 houses per annum.

VI.—EXPENSES OF FIRE-BRIGADES AND THE ADMINISTRATION OF THE INSURANCE SYSTEM

The expenses for protection against fire as well as those for the administration of the system of insurance would naturally have to be paid from a general government tax for the insurance of buildings.

From the "Tables of Expenses that are separately paid by the people" the expenses of extinguishing the fires were in 1873 yen 77,788.00
 1874 „ 95,690.00
 1875 „ 88,544.00

in 1873-75 „ 262,022.00

or a yearly average of „ 87,341.00

Among the expenses which have been paid from the "Fukin" i.e. the taxes on theatres, *geishas*, prostitutes, &c., I find one more item amounting to yen 6,981.00 for extinguishing fires. If we assume that such an amount is an annual charge we find that the average annual annual expenses amount to yen 94,322.00. Let us further suppose that the additional care would result in augmented measures of protection and consequently augmented expenses to the extent of double the previous expenditure, and then the cost would amount to yen 188,644.00.

A government insurance system would possibly be administered here in a certain connection with the police, perhaps also partly in connection with the finance department. In countries where fire insurance is obligatory, the police frequently gives assistance to the insurance institutions.

But whoever would do the work,—police or finance department or a separate office, or several offices together—the assessment of the buildings, keeping the registers in order, collecting the premiums, estimating and paying the damages done by fire, earthquakes, inundations, gales and war, the financial operations for the investment of the money remaining, or for the payment of damages, the administration of the reserve fund, the controlling of officers, cash and books, the formation of insurance laws and insurance statistics—all would cause expense.—

In order to gain a basis for an estimate, however vague, I will assume that the activity and consequently the expenses necessary for this work would be one-tenth that of the activity and of the expenses of the police department.

The expenses for this latter for the year 1877 according to the budget, dated December 28th, 1877 of H. E. M.'s Okubo the Minister of Finance* are yen 2,001,746 00. Therefore we will estimate the expenses of a Japanese insurance institution at yen 200,000.00. But as we compute the insurance premium from the relation between the number of destroyed houses and the total number of houses in Japan we must also make "a house" the unit of our calculation for the expense of extinguishing fires and of administering an insurance department. Suppose that the government donation of yen 35.17 per house represents the average value of a Japanese house (—in Kanagawa *ken* it was yen 43.63 for the town and yen 30.08 for the villages—) we would have:

Yen 188,644.00 the cost of extinguishing = to the value of 5078 houses
 „ 200,000.00 do administration = to the value of 5384 houses

The average value of a Japanese house is probably higher than yen 35.17, but we take it so in order to be sure and increase sufficiently the number of houses which gives the basis for the calculation of the amount of the insurance premium.

VII.—THE AVERAGE ANNUAL EXPENSES

expressed in houses of an institution for the collective insurance of buildings against fire, earthquakes, gales, inundations and war would be:

for damage by fire...	44,085 houses
„ „ „ earthquakes ...	2,000 „
„ „ „ gales ...	500 „
„ „ „ inundations ...	2,000 „
„ „ „ war ...	6,500 „
„ extinguishing ...	5,078 „
„ administration...	5,384 „

Total 65,547 houses.

* See Japan Times, January 12th, 1878.

VIII.—THE TOTAL OF HOUSES IN JAPAN AND THE AMOUNT OF THE INSURANCE PREMIUM.

We have now to consider what the proportion is between these 65,547 houses and the total number of houses in Japan.

Although we frequently find in newspapers the number of houses in a town or province, and in extracts from statistical returns the number of houses in the whole of Japan, yet a glance at the original documents shows that the houses are not at all counted in Japan. The Chinese character which is usually translated "house" is read *kamado* and means literally "hearth," and is an expression similar to that used by the Swiss, who count the persons, "who possess their own smoke."

The expression *kamado* does not mean house, because frequently there are several "hearths" in one house. I would translate it by "household." The manner in which the unit containing several persons is formed for statistical purposes, and which places the number of inhabitants on one side, and of houses on the other, is very different in different countries. Japan, Switzerland, Germany and France count by households; England and Italy by families; and Cisleithian Austria by "*Wohnparteien*" (resident parties). If we call all these units "households" and compare them with the number of inhabited and uninhabited houses, we find that in no country do the numbers correspond. The number of houses is everywhere less, or, in other words, there are more people in a house than in a household.

Thus, for instance,

	year.	in one household	in one house.
in France	1872	3.7 persons	4.7 persons
„ England	1871	4.5 „	5.0 „
„ Switzerland.....	1870	4.5 „	(6.5)* „
„ Cisleithian Austria	1869	4.6 „	7.1 „
„ Germany	1871	4.7 „	7.7 „
„ Japan	1875	4.7 „	? „
„ Italy.....	1871	4.9 „	5.3 „

In this table France, with its small power of reproduction, has the least number of persons in a household; the other countries show a remarkable unanimity in approaching the number of 4.7 persons per household, which is exactly the average number belonging to a *kamado* in Japan. In the average number of inhabitants in each house, Germany and Cisleithian Austria, with their large houses, let out in flats, look most unfavourably placed, England, with its houses containing only single families, shows a difference of + 0.5 and Italy only + 0.4 persons. Japan also possesses large houses let out in tenements, although not built story above story, nor, at least as far as my observation goes, very numerous. I think that by taking 0.2 persons more, or 4.9 persons in each Japanese house we arrive at a sufficiently small number of houses. A further proof of this is to be found, at least for the capital, in the fact that in certain cases where we may be sure that the number of houses and not of *kamado* is given, the number of people in one house is much less than this.

In the great fire which broke out in Tokio on the 29th November, 1876, 9,806 houses were consumed, and 30,460 persons, or 3.1 per house were made homeless.

In the fire which broke in the Senroin Temple at Asakusa on the 31st December 1876, 1,196 houses, which were inhabited by 4,063 persons, or 3.4 per house, were destroyed.

If therefore I take 4.9 persons as the average per house, I think I may be sure that the total number of houses in Japan is sufficiently reduced; that is, that the insurance premium is increased in the inverted proportion.

According to the Census taken on January 1st, 1875, Japan has 33,997,449 inhabitants, in 7,220,559 households, 4.9 persons to one house gives us 6,938,255 houses. Comparing this number and the average annual expenses, expressed as above in houses, we find that the average annual expense of 100 houses is 0.9477; that is an annual insurance premium of not quite one per cent, namely 94½ *sen*, for each 100 yen of the value of the house.

(To be continued in our next.)

* In reckoning the number of houses in Japan, there is no distinction made between inhabited and uninhabited houses; and it is similar in every other country, except Switzerland, where the number of uninhabited houses is not given. Hence the average number of persons to each Swiss house has become somewhat higher.

THE TIMES OF TAIKO.

(FROM THE JAPANESE.)

BY F. BRINKLEY, CAPT. R. A.

ISHIKAWA GOYEMON.

Chapter XIX. THE KOYA CLOISTERS.

EVEN the brief lull that presages the hurricane's change brings with it a sense of relief and security. Nature makes us sanguine before experience teaches us to be calculating, and it is fortunate for our happiness that it should be so; else would the sunshine of life only serve to render the gloom beyond doubly sensible.

Thus it was with Hidetsugu, when he saw himself reprieved from the disasters Goyemon's confession must have entailed. A reaction, pleasant but delusive, succeeded his painful anxiety. The robber's fortitude might have been foreseen, but his fidelity to a cause so recently espoused, and loyalty to a promise so lightly given, were sufficiently wonderful to persuade Hidetsugu that he was surrounded by the most invulnerable of all defences, a bulwark of faithful hearts. Hence the hum and tramp of the multitudes, as the flocked home from the place of execution, telling each other in whispers of the horrors they had witnessed, sounded to his ears like a vast voice of gratulation, and in the fullness of his relief he was almost glad that the failure of his parricidal designs had saved him from dreading the curse of heaven.

With reflection, however, came disquiet. The conditions that had driven him to extreme action remained unchanged, and were even more than ever embarrassing, for though the tabard accusation had not been proved, it remained none the less unrefuted.

While deliberating and advising with Bansaku and a few other devoted servants on the morning after Goyemon's death, the Minister was summoned to receive an embassy from Fushimi. The envoys were Ishida, Nagatsuka, Masuda and Tokuzenin, Councillors of state. Hidetsugu and Ishida had now recognized each other as deadly enemies, but their hostility only manifested itself at this interview in an excessive interchange of courtesies. The Minister, however, divining from the composition of the embassy that his fate was finally in the balance, and nerved by the presence of his hated foe, received the envoys' message with unflinching calm.

It was delivered by Tokuzenin. The Regent had, he said, received indisputable proof of the Prime Minister's treasonable designs, and finding it impossible to leave him any longer in the exercise of his high functions, desired that he should immediately resign his office, leave the Palace of Pleasure and retire to the cloister in the mountains of Koya.

Plainly this sentence was framed so that its vagueness might render appeal difficult. Hidetsugu did not fail to note the fact, but he found it impossible to reconcile it with the circumstance that the embassy had come unprovided with the means of enforcing the orders it conveyed. What was he to understand? Either that Taiko, while accusing him of treason, confided in his obedience, or that this message was a mere threat. The latter hypothesis was untenable; the former, inexplicable. He applied to the envoys themselves for elucidation.

Tokuzenin replied that he believed the Regent had no real intention of disgracing his son, but that his whole object was to elicit some proof which might once and for all, silence slander. Such a proof would be afforded, for example, if on receipt of this harsh command, the Minister were to visit Fushimi in person, and by placing himself unreservedly in the Regent's power, declare at once his own innocence and his confidence in Taiko's justice.

If this was a plot, it was subtly conceived; if honest advice, its rejection was difficult.

Hidetsugu, knowing that his own and many of his vassals' lives depended on his decision, withdrew to consult those whose counsels would at least be faithful. They were four: Shirai, Earl of Bingo, Kumagaya, Bansaku and Sir Kimura.

In the vicinity of real peril, brave men are always composed. It would have been difficult to believe that the deliberation which now took place had reference to anything of more than passing interest. The Minister, in a few composed words, describing the Regent's message, his own perplexity and the envoys' advice, invited his four friends to assist him with their counsels.

Shirai, Earl of Bingo, spoke first. He thought that two of the four should go to Fushimi, declare their master's in-

nocence, and support their statement by suicide. If their mission failed, the other two, assembling all the available troops, should lead them against Taiko, and in the event of defeat, the survivors should set fire to the Palace of Pleasure and die there with their master.

Kumagaya, while approving of resistance, opposed this plan as too precipitate and because it would involve bloodshed in the neighbourhood of the Emperor's palace. He counselled retreat to the castle of Sakamoto, and afterwards, either negotiation or defiance.

It was now Bansaku's turn to advise. Hidetsugu almost anticipated his views, for he knew that Goyemon's inhuman punishment had excited not only remorse but disaffection in the comptroller's heart. "If the Regent desired to discriminate between truth and falsehood," he said, "your Excellency's traducers would long ago have been silenced. Let us no longer expose ourselves to the disgrace of fruitless appeal; but since your Excellency's arch-enemies are here now in our power, let us commence by punishing their treachery, and then, marching to Fushimi after nightfall, fire it and conquer, or die sword in hand. Or, if we find our force insufficient to attack, let us get possession of the Emperor's person, carry him to this palace and then defy Taiko here."

This programme was bold, and commended itself particularly in one respect: its point of departure was Ishida Mitsunari's death. This deed once achieved, let the sequel be what it might, the bitter possibility of Chika's falling into the Baron's hands would be finally averted. But Hidetsugu's inclinations, though not strong enough to develop independent resolution, found nothing cognate in any of these suggestions. Still vacillating, he appealed to Sir Kimura, no longer a monitor, but an ally; for, having rejected the alternative of official complaint, Sir Kimura had now no choice but to die with the man he had failed either to save or to denounce.

"It seems to me," said this faithful man, "that we have forgotten who our opponent is. With Taiko, to threaten is to strike. If the message carried by the embassy be a true statement of His Highness' intentions, the troops from Fushimi are already marching upon the Palace of Pleasure. We have no time either to anticipate or oppose. Shall we choose then instant suicide—or instant flight? Neither, I think, since either would at present be an admission of guilt. Let us rather adopt the course suggested by the envoys. It cannot fail to restore the Regent's confidence, and will not, under any circumstances, deprive us of a soldier's last refuge—death."

Hidetsugu recognized in this proposal a definition of his own vague purpose. He dismissed the envoys, and in a few minutes followed them, as he thought, to Fushimi. To increase the amicable aspect of his visit, he chose to travel by palanquin, rather than on horseback, and contented himself with an escort of thirty footmen. Bansaku and all the Minister's favourite attendants, however, without order or explanation, took their places among this escort, and the paucity of its numbers was rendered doubly palpable by the multitude of well-wishers that watched its departure from the palace gates. The sanguine indolence of Hidetsugu's nature prevented him from observing, or disposed him not to observe, such tokens of his vassals' instinctive disquiet as the assortment of armour, the examination of weapons and the saddling of horses. Nevertheless, he set out with a feeling that he did not care to analyze: it might have been the offspring of uncertainty, it might have been the herald of farewell.

A man journeying in those days from the Palace of Pleasure to Fushimi, had the choice of two routes: he might either follow the "Avenue of the thousand Pines" to the southern limit of the capital, and then, crossing the river, travel due east by the Misumi Marsh; or if he preferred the city ways, he might leave the Pine Avenue, and passing by one of the main streets to the eastern suburb, strike thence due south to Fushimi. So far as distance was concerned, both routes were alike. It was simply a question of travelling south and east, or east and south, for the lines of all the principal streets and roads of Kiyoto being directed upon some two of the cardinal points, and Fushimi lying south-east of the Palace of Pleasure, no straight path connected the two places. The Minister however, and indeed most noblemen or officials, generally adopted the former route, as being the less frequented, and no doubt Hidetsugu would have done so on this occasion also, had not his choice been influenced by an exceptional consideration. If he followed the Pine Avenue through its entire length, he would pass almost within sight

of Goyemon's place of execution. He therefore directed his escort to proceed by the city, happily ignorant of the momentous issues contingent on this trifling preference.

He traversed the town, and crossing the river, turned into the straight road to Fushimi without mischance, but while passing the fane of the "Colossal Budha," his followers became conscious of a strange stir and turmoil that seemed to be borne to them with more and more distinctness from the south and west. It was a confused medley of noises, such as might succeed an alarm of fire or precede an outbreak of the people, but dominated by a sound full of disturbing suggestions—the clatter of innumerable horses' hoofs.

A large body of cavalry was evidently approaching from the direction of Fushimi, and none thought of doubting that its destination was the Castle of Pleasure. To encounter this force *en route* signified one of two things:—ignominious surrender, or death at the hands of the common soldiery. The escort halted involuntarily, and Hidetsugu, raising the blind of his palanquin, beckoned Bansaku to his side.

For an instant, the two men looked and listened in silence. The distant tumult, no longer confused by the sounds of their own progress, seemed to have suddenly grown nearer and more intense.

"Bansaku," said the Minister, at last, in a low tone, "that I did not follow your advice is the chief regret of the few moments I have still to live." Then raising his voice so that his words addressed themselves to all his followers, he asked:—"Has no one any useful counsel to offer while we have still time to consider the manner of our deaths?"

This question elicited no immediate reply, but the main part of the escort, loosening their swords or uncasing their spears as they closed together in front of the palanquin, tacitly evidenced their own determination as well as the imminence of the approaching peril. Bansaku, observing this movement, which threatened to substitute temerity for deliberation, hastened to interpose.

"The shrine of Tofuku is but a few furlongs distant, your Excellency," he said. "Let us die there by our own hands as becomes gentlemen, rather than wait here to encounter the weapons of ignoble subalterns."

But even while admitting the wisdom of this proposition, Hidetsugu did not accept it. His sensuous nature revolted at the idea of a quiet, unostentatious death; a death deprived of every retributive adjunct, and unpreceded by any expression of affection or farewell. By employing expedition, there might still be time to reach the Palace of Pleasure before the troops from Fushimi, which were as yet more than a mile distant. He therefore signified his intention of retracing his steps.

Scarcely, however, had the escort reformed and the bearers turned the palanquin, when a man-at-arms came running towards them from the bridge. His head was gashed by a sword-cut, and his exhaustion almost rendered him incapable of conveying his intelligence, which was that shortly after the Minister's departure, the palace had been seized and was now held by some four thousand of the Regent's horsemen.

If the Minister had followed the usual route by the Pine Avenue, he must have perceived the approach of these troops and in all probability could have anticipated them. Goyemon's death, the first-fruits of his unnatural crime, had thus become the agent of his punishment.

Nothing was bitter to him at that moment, than the consciousness that he had been duped to the last by the subtle Ishida, for plainly the four Councillors' specious words had only been a ruse to inveigle him from the palace, and thus deprive its garrison of the power to resist. The first flash of disappointed rage revealed to him the design that had induced him to retrace his steps, rather than adopt Bansaku's suggestion. Had he succeeded in returning to the palace, death should have secured Chika's fidelity, and the magnificence among which he had lived, fed the flame of his funeral pyre.

But now! A scanty band of two score followers, without horses, without armour, their only asylum held by four thousand enemies and the onset of perhaps as many more thundering every moment nearer and nearer. "Oh! that I were mounted and armed," cried Hidetsugu passionately. "Could I but strike one blow before these lying plotters have compassed their ends!"

At that instant, as though in answer to his exclamation, the sound of horses' feet was heard on the bridge, and a troop of cavalry rode up, headed by the Councillor Masuda.

The Minister's escort formed hastily between their master

and this new danger, but Masuda, halting his men at a little distance, dismounted from his horse, and advancing, knelt on the road before Hidetsugu's palanquin.

Seeing, as he thought, one of the chiefs of his foes kneeling within arm's length, Hidetsugu seized his sword and bent forwards as though about to strike. A word or a sign, and Masuda Nagamori's head would have rolled in the dust. The Councillor must have known his danger, yet he did not abridge his reverence or change his position of obeisance.

"Your Excellency's palace," he said, after a moment's pause; "has been seized in pursuance of an order unknown to me when I had the honour of an interview with you this morning. It is now guarded by the Regent's cavalry, of whom a second body, two thousand strong, has, I believe, left Fushimi and is approaching by this route. Retreat or advance is therefore alike impossible with your small force, and I have come to offer you the assistance of my own soldiers. They are only four hundred in number, but will be sufficient to escort your Excellency to a place of safety, where you can await the Regent's instructions."

If this also were a plot, what was its motive? Betrayed by Masuda's soldiers or sabred by the Regent's cavalry, the end was the same, though the means might be different. While Hidetsugu debated, the Councillor, still on his knees, tacitly offered this risk of his life as an irrefragable demonstration of his sincerity.

Meanwhile the space that permitted election was growing shorter and shorter, in proportion as the tramp of the cavalry sounded nearer and nearer. Hidetsugu, seeking some escape from indecision in his followers' department, and finding that even Bansaku himself sedulously avoided his enquiring gaze, understood that this reserve signified approval of Masuda's advice, embarrassed by reluctance to acknowledge the necessity of retreat.

"Betrayed as I have been, I cannot as yet determine whether your present action deserves gratitude or execration, Masuda," he said with a bitter laugh, "but whatever your purpose may be, know that, if I seem to seek a little respite by adopting your counsels, it is not because I value my life more than dew or dust, but because I would fain defer my death till truth shall have somewhat marred my traducers' triumph."

With these words, addressed as much to his reputation as to the Councillor, he descended from his palanquin, and mounting Masuda's horse, set off at full speed for the cloisters on Mount Koya. Beside him rode five of those that had followed him that morning from the Palace of Pleasure: Sasabe Earl of Awadz, the comptroller Bansaku, and the pages Yamamoto, Yamada and Risseido, while before and behind Masuda's cavalry at once protected and imprisoned him.

Their route led them within a few miles of Fushimi, and the little party closed instinctively about their master, each time some opening in the hills or woods added the towers of the Regent's castle to the ever-widening landscape. But hamlet, valley, ford and ravine separated them gradually from the possibility of pursuit or ambush, and when nightfall compelled them to exchange the precipitancy of flight for the deliberation of travel, the memory of the things they had left began to be fraught with regret, rather than apprehension; for they knew that with whatever suffering or mischance the future might be pregnant, all hope of return to the places of pleasure and the fellowship of affection had lapsed irrevocably into the darkness now closing about them.

They made no halt by the way, except such as was necessary to refresh their horses, and sunset found them the following evening but a few furlongs distant from the foot of the Diamond Peak and its city of cloisters. The abbot and more than five thousand friars, all dressed in white and each carrying a lantern, knelt with bowed heads on either side of the road to receive their illustrious visitor, and every step that Hidetsugu advanced through this long lane of cenobites seemed to place a distance, more and more sensible, between himself and the world in which he had played so conspicuous a part.

He was conducted by the abbot to the guests' room in the principal cloister—an apartment almost rudely simple in its construction and furniture, but not lacking interest of scenery or circumstance. For, on the south, a stream, bordered by willows and wild azaleas, crept away from the steep slopes of a mountain, where stunted pines lapsed year by year into leafless decrepitude, and rugged rocks pushed their mossy heads into the spray of a cataract that tumbled towards a lotus lake

below; while on the west, across a lattice of bowing bamboos, the eye discerned Kobodaishi's sepulchre, and around it the graves of many a generation of ascetics, whose uneventful lives had drifted quietly into the everlasting slumber their devotions contemplated. The abbot, a meagre, wrinkled old man, who for more than threescore years had tasted neither fish nor flesh, and whose nervous fingers, from long habit, never ceased to tell real or imaginary beads, sought in vain, by prolonging his humble obeisance, to hide the tears that welled up from his compassion at the aspect of Hidetsugu's weariness and dejection, and Hidetsugu himself found something so moving in the prophetic sympathy of this venerable anchorite, that for a moment he could not command words to address him.

"Father," he said at last, "you, to whom time is but a passage to the life beyond the grave, will teach me how to take my leave worthily of things that have been too dear to be easily forgotten. With this view I have sought your cloister; for I have but a few days, perhaps but a few hours to remain on earth, and I hope that the cruel power to which I have fallen a victim will not deter you from affording me your charitable offices after death."

"Your Excellency," answered the abbot, raising his tearful face, "if by any chance the end you foresee should overtake you here, whatever light our prayers may summon shall surely guide you through the shadows of the grave. But it cannot be that, instead of an asylum, you should find a tomb among our cloisters. Our community numbers more than seven thousand souls, and for more than seven hundred years the hand of heaven alone has measured the span of human or animal life within these precincts. The gods who for so many centuries have received our incense and our prayers, will now give strength to our voices, united in your Excellency's behalf, and accord us the infinite happiness of reconciling you with your august father."

Hidetsugu shook his head sadly. "Even were there any hope in your proposition, father," he replied, "I should not entertain it. I come here, to take leave of the world, not to seek a means of returning to it; for though I have given much love, I have gained but scant fidelity in return. Why should I seek to live when nothing remains to live for?"

"Your Excellency," answered the abbot, "hope is only lost by ceasing to hope, and happiness by inability to wait. The withered leaf, however long it has been tossed over waste and wold, finds in some land a sheltered nook where rains and dews may dissolve it into nurture for another bud. The stream that loses half its volume among jagged rocks and in sunless caverns, creeps quietly at last among roots of the fragrant lotus and brilliant iris, and the tears that have fallen through all ages, swelling the stream upon which our prayers are borne to the feet of the Gods, are yet a solace without which human hearts would be charred and wasted by the fire of affliction even as the parched upland is cracked by the summer drought. The page of life is a lesson of hope and the ends of all things are types of mercy."

"Father," replied Hidetsugu, "your philosophy is impossible to me on this side of the grave. In your own words, I have ceased to hope, and lost the ability to wait. I have indeed," he continued, and his voice trembled as he spoke, "found life under some aspects beautiful and full of sweetness; but like a false friend, its fellowship has brought me only shame and sorrow. It can scarcely have been a keener grief than mine that interpreted the sounds of the sea to the exile Michizane, when he said:—

"The ripple's plash, the billow's roar,

"The varied voices of the main,

"Through all their tones sing one refrain,

"A requiem for the shattered shore."

"And as for me, whether the song of the birds and the whisper of the winds come to mock my misery or remind me of my happiness, I am determined to remain no longer among things that only serve to awaken painful memories. At day-break I will ask you to perform for me the rites of separation from the world. Until then, I only desire to be left undisturbed."

The old abbot was very capable of sympathizing with this request and the feeling that dictated it. He himself had not been a stranger to that most poignant, most anguished of regrets which visits a neophyte of the creed inculcating eternal annihilation, when he first realizes the fact that neither memory of this beautiful world, nor perception of the love that makes life elysian, shall ever visit the endless, infinite lapse of dreary nothingness awaiting him hereafter. Understand-

ing therefore, that despite his pretended resignation, Hidetsugu had not yet summoned courage to bid farewell finally to the past, he left him to gather what comfort he might from communion with the shadows of forfeited power and lost love, and applied to Bansaku and the Earl of Awadz, in the hope that their influence might induce Hidetsugu to accept the intercession of the cenobites.

If it were true that the shrines of Koya had really been indicated by Taiko himself as a retreat for the Minister, their selection could only bear the interpretation of a desire to save Hidetsugu, and the consummation of that desire must necessarily be achieved by the priest's interference. Not to interfere therefore, would be at once to disobey the merciful teachings of their religion and to defeat the Regent's clement designs. The Minister's followers could not doubt the justice of these views, for they found it incredible that Taiko should have wantonly determined to defile, by a deed of blood, the purity of a fane to which life was preeminently sacred. Bansaku and the Earl, therefore, willingly undertook to urge the adoption of the abbot's counsels.

But Hidetsugu obstinately refused to permit any action that might be construed into an acknowledgment of guilt. The thought that he had been condemned unheard was no small solace to his morbid feelings, and since in his heart he believed that Taiko, desiring his death least of all things, looked confidently for some demonstration of submission to justify clemency, he determined, as far as might be, to defeat this intention, and afford the Regent no pretext for abandoning a course, that all the nation must eventually regard as unjust. It was characteristic of the man that, while he thus risked his life to gratify a momentary feeling of umbrage, he took no account of his followers' fate. In a mind so entirely devoid of just equipoise, the slightest sense of injury sufficed to overbalance every consciousness of guilt or feeling of gratitude, so that not only were all his old crimes forgotten, but his distraught fancy construed the very fact, that any should be passive sharers of his suffering, into a tacit acquiescence in the legality of his punishment. So far, therefore, from attempting to evade the end, he prepared to invest it with all possible solemnity of ceremony and observance.

(To be concluded in our next.)

EXTRACT.

THE WRECK OF THE MEIKONG.

(From the Bombay Gazette March 22.)

[The following article from an Indian contemporary, will be read here with a certain amount of interest by friends of the passengers concerned.]

THE passengers by the Messageries steamer the *Meikong*, who escaped with their bare lives from the wreck of that vessel on the African coast last June, having, by this time, overcome the feeling of gratitude for their personal deliverance, begin to think they should look after their baggage. This we gather from a letter by "A Passenger" that appeared in our Tuesday's paper. The writer calls upon his fellow passengers to join him in suing the "Messageries Maritimes" Company in the High Court of Calcutta in the hope of recovering compensation for the personal baggage and valuables lost by them near Cape Guardafui. From the vantage ground of our columns this courageous litigant calls on his fellow-sufferers, now scattered in the uttermost parts of the earth—even in far Scotland and Ireland—to make common cause and sue the owners of the unlucky *Meikong* for damages. Calcutta, being the place where the contract for passage and freight would be made, is, we presume, the proper jurisdiction in which redress can be granted. Doubtless, before proceeding to enter an action the passengers or their friends will be well-advised, both as to the jurisdiction of the Court and the form that the suit should take. It is not likely that they can prove breach of contract, merely because the vessel was wrecked. It was never contended, so far as we remember, that the errors of the French captain in navigation were so obvious and culpable as to render him or the Company liable for direct damages. Those convenient phrases "act of God" and "peril of the sea" will have to serve their turn until ships, crews, and the lighting of dangers are much nearer perfection than at present. Meantime the shipmaster must have such benefit of the doubt as is implied in the use of those indefinite terms.

If the *Meikong* passengers are to succeed, their action must be based on circumstances that occurred subsequent to the wreck.

Their case may be rested on the neglect or *laches* of the captain or agents of the owner at the time when the baggage and valuables of the passengers could have been recovered. It is not for us to express an opinion as to whether such neglect can, after this lapse of time, be proved; or, if proved, whether the legal effect would be to carry damages. Whilst, however, disavowing any pre-judgment in favour of the passengers' case, we are able, from entirely independent testimony, to speak, in outline, of what appears to have been *insouciance* or grave misjudgment on the part of those who should have put forth their utmost exertions for salvage of the Meikong's cargo and the passengers' effects. It appears that after the rescue of the ship's company and their transference to Aden by dint of the exertions and discretion of the captain and officers of the *Glenartney*, the captain of the *Meikong*, according to the proper procedure, made his report to the French Consul at Aden. Probably this report would also be made to the British Resident and the Aden Harbour Master. This must have been so, for we have a tolerably clear recollection of those authorities having offered, to the French captain and Consul, to place a steamer at their disposal, which might be sent to the scene of the wreck—obviously for the purpose of ascertaining the condition of the cargo and taking measures for salvage.

If the fact of this offer having been made can be established, it will be an important element in the passengers' case. What course was taken on receipt of the offer is not quite clear. One step that was then adopted strikes us, as it did when it was reported at the time, as very unusual, and, as the event proved, very ill advised. The captain of the *Meikong* and the Consul are said to have applied to the ship captains then in Aden harbour to hold a sort of council to assist them in deciding whether to accept the steamer and make arrangements for a salvage expedition. One would like very much to have the minutes of that informal court of skippers, and especially to have a verbatim report of the sentiments expressed by the dissentients. The result of having called in these chance councillors in aid of the captain and Consul—who, we suppose, were the only persons responsible for the decision—was, that the offer of a steamer made by the Aden authorities was declined. The captain of the *Meikong* was said to be anxious to get home to report himself and the disaster to his superiors. Anyhow, he shortly turned his back on Aden and left the flotsam and jetsam of the ship to its fate.

As may be readily supposed, the opportunity thus afforded was not neglected by more adventurous spirits. The Somalis, who had appropriated a good many of the lighter portions of the passengers' effects before the shipwrecked people left, proved themselves to be very expert and effective salvors. Everything having been abandoned, these untutored Africans can scarcely be blamed for securing as much as they could of these spoils of Europe and Asia thus thrown in their way. And lest these unsophisticated people should be too much perplexed as to how to dispose of their treasures, certain persons of "European extraction" appear to have proceeded from Aden with a view of turning an honest penny out of the affair. We heard of a certain Vice-Consul having set up his flag on the beach near Cape Guardafui; and, we dare say, he took a very handsome haul. Whether he secured any considerable portion of the passengers' effects is doubtful, for the valuable cargo of the ship offered more tempting and more readily meritable prize. But this part of the history remains in much obscurity. Some information on these points would be obtained by the commander of the *Kuanyung*, the Bombay Government's steamer which was sent down the same coast a few weeks later to report upon and secure what could be saved from the wreck of the B.I.S.N. steamer *Cashmere*, which also fell a victim to the perils of that neglected coast. That information should be still available and may prove serviceable to the passengers of the *Meikong*, though the *Kuanyung* had no instructions concerning that vessel or its cargo.

Whilst the losses of the passengers by the French steamer, being personal and direct, may serve more readily to excite sympathy, we have the always felt at far more public interest pertained to the question of *Meikong's* cargo and its abandonment. It may be too late now to go into that subject; for, as it was the underwriters' business, it was nobody's business. Underwriters seem to be a remarkably incohesive class. They are ever more bent on competition than co-operation; hence a vast amount of preventable loss and waste, ever and anon, takes place all over the world's coasts. We have reason to believe that the neglect and abandonment of the *Meikong's* peculiarly valuable cargo affords a striking instance of this wanton waste.

The loss of that vessel and that of the *Cashmere* may be considered to have settled the question as to the necessity of the Guardafui straits being properly lighted; but there remains to be decided—when and how? We now feel in a palpable shape the

grievous impolicy of the abandonment of the Somali coast to the impecunious and impracticable Egyptians. Not even a plausible excuse has been given by the British Foreign Office for this foolish concession, which was too weakly concurred in by the remote and short-sighted Simla bureau. Had there been no Egyptians in question, the funds for surveying, buoying and lighting the straits and coasts between Socotra and the African mainland could now easily have been subscribed by the maritime nations under the direction of those experienced and competent authorities the elder brethren of the British Trinity House. As the Khedive is bankrupt this course may still have to be taken; but as we have abandoned the Somalis and their Arab Sheiks to the tender mercies of Pharaoh, we therewith lose all the accessory and concomitant advantages that we should have secured through control and co-operation of those tribes. This additional assistance and security could easily have been attained through our Resident at Aden. Now, as the detested Egyptians are alone responsible, the Somalis will think themselves justified in carrying on the trade of wreckers and self-appointed salvors whenever they get a chance.

*. The dates of Arrival and Departure of the Mitsu Bishi Company's steamers are susceptible of alteration, consequent on the necessity imposed upon the Company—by its contract—of connecting with the steamers of the Pacific Mail.

*. No days for Arrival or Departure of the Pacific Mail Company's or Occidental and Oriental Company's steamers having as yet been fixed, we are unable to tabulate them. Each separate steamer's departure from her port will be notified in the Table below, and the day of her probable arrival at her destination.

*. Three days are allowed in the P. & O. Company's Schedule for transit of the Mails between London and Brindisi.

*. Two days are allowed in the Messageries Company's Schedule for transit of the Mails between London and Marseilles.

SCHOOL FOR CHILDREN IN SWITZERLAND.

MADAME A. JAQUEMOT (née Dogny) proposes to establish at Geneva, Switzerland, a Boarding School for Girls, and for Boys under 12 years of age; where they will have the advantages of a sound education and sedulous domestic care.

Boys over 12 years of age may be committed to Madame Jaquemot's charge as boarders, and parents can thus secure for them the comforts of a home, with the opportunity of attending one or other of those educational establishments for which Geneva is so justly celebrated.

Parents wishful to place children under her charge at the Pension Dogny, may address their enquiries as to terms &c. to the Editor of the *Japan Times*, who is empowered to furnish them.

OKUBO TOSHIMITCHI.

DEATH,—sudden, violent, bloody,—freezes into silent horror the jocund life of Spring. Passing, in the dewy morning, to his daily labour, through May-blooms fluttering down through the warm, scented air, messengers to tell the earth of the promises of Summer's fruits;—pondering schemes for developing his country's latent wealth, for teaching her sons how best to utilize their toil;—unheeding the carol of the up-springing lark, rejoicing in the simple joy of living, as he rose, quivering, into the blue heaven;—annoting the pair of gay, light-hearted students whom he passes on the road, one threatening the other with no more deadly weapon than a branch of blossoming pear, Okubo Toshimitchi, Minister of the Interior, the strongest pillar of the Emperor's throne, the virtual leader of the Cabinet, and one of the truest patriots this ancient Empire has ever produced,—suddenly falls, under the blows of assassins' swords,—his life's work incomplete, its reward unreaped, his fame but half-achieved. That branch of blossom hides a blade—flung into the dust, it gives the signal to an ambushed band of crouching, eager foes. There is an exultant yell, a fierce rush, the flash of sabres in the morning sun, the mad gallop for a score of yards of a wounded horse, and then—struggling up through the wreck of an overturned carriage, a great statesman rises into the grasp of vulgar murderers, and—for him—the rest is silence. *Namu Amida Butsu!*

Japan has to mourn, to-day, one of the worthiest of her sons. Born in Kagoshima in 1836, Okubo Toshimitchi Ichizo was the son of Okubo Jiyemon, a *Shizoku* of the Satsuma clan. Early distinguished for his intelligence and capacity among the 'jeunesse dorée' of Satsuma, he was, while yet a boy, attached to the personal staff of his Prince; and pursuing diligently, during his service, the studies which he loved, he soon became a proficient in Chinese literature, as well as in the ordinary branches of education of a Japanese gentleman. His ability attracted attention, and at the age of twenty, he was appointed to a post in the Finance bureau of his native province.

During the eventful years which followed the signature of the Foreign Treaties, Okubo appears to have so distinguished himself as to win the regard and respect of many prominent men in the Court of Kiyoto and of several of the leaders of the other Southern clans, for we find him, in 1868, a prominent member of the coalition of patriots who overturned the usurping dynasty of Tokugawa, and restored the Mikado to his ancient power. He accompanied Saigo to Chosiu, and arranged with the leading men of that province the alliance with Satsuma, Tosa, and other clans which eventuated in the Restoration.

In March 1868, the Tokugawa dynasty having been overthrown, and a new system of government inaugurated, Okubo was appointed, with five others, an under-secretary of the important Department to which was com-

mitted the care of the administration of Home Affairs; his nominal chiefs being Okimachi Sanjosaki no Dainagon, Tokudaiji Chiunagon and the Daimios of Tosa and Echizen; and it was he who suggested the important move of transferring the seat of power from Kiyoto and constituting Yedo the metropolis, under the new name of Tôkiô, the 'eastern capital.' In July he was appointed *Sangi* (privy Councillor) and the Emperor rewarded his services to the country in September of the same year, by granting him a pension of 1,800 *Koku* of rice, which however Okubo respectfully declined to accept, and which, on the Emperor insisting, he transferred to the Board of Industry, a bureau established for the purpose of promoting the development of the Industries of Japan.

In 1870, he accompanied Iwakura and Saigo to Kagoshima, and subsequently to Tosa, and induced the Prince of Satsuma and Itagaki, *Karo* or premier of the Tosa Daimiate, to come up to the capital, where a conference was held, and the feudal system entirely abolished, on the recommendation of a Commission of fifteen of the ablest men in the Empire, with the late Kido at their head. In the re-organization of the Government, in June 1871, he was appointed Minister of Finance, and when the Embassy under Iwakura was despatched on its mission to America and Europe, in 1872, Okubo, jointly with Kido and Ito, was nominated Vice-Ambassador. From Washington, he returned to Japan with Ito, and suggested the revision of the Treaties with Foreign nations, the Government of the United States having signified its willingness to consent to the measure; but did not succeed in obtaining the sanction of the Government here to grant the Embassy the necessary increased powers to carry out that object. In fact, the other Powers having Treaties with Japan very properly declined to discredit their own envoys, by treating directly with the Japanese Embassy, and relegated the consideration of the question to their Representatives in Japan, as more fully competent to discuss the new proposals. He therefore rejoined the Embassy in Europe, returning finally to Japan in 1874, when he was immediately reappointed a *Sangi*.

On his arrival, he found the Government had adopted a policy with regard to Corea which he considered detrimental to the true interests of the country, and against this policy he set his determined opposition, which was successful. But it resulted in the resignation of Saigo, Soyeshima and others and their return to their native provinces, and from this point diverged the paths in life of the two ancient colleagues whom we have seen working together for the Mikado's restoration, each ending in violent death, the one meeting his fate last year on the battle-field, the other falling now beneath the swords of assassins. Appointed Chief Minister of the Home Department,—when, shortly after the abandonment of the Corcan invasion project and the retirement of Saigo and his friends, the Saga rebellion broke out, in 1874,—Okubo was nominated to the

command of the forces, and by the firmness and energy he displayed, and his able use of the new means at the disposal of Government for the transport of men, munitions of war and transmission of intelligence, this rebellion was speedily and effectually crushed. The Formosa question then arose and Okubo proceeded to Peking, accredited as Special High Commissioner from his Sovereign, and succeeded in bringing the difficulty to a satisfactory issue in such a manner as well deserved the approval of the Mikado and the country generally, and also elicited the cordial approbation of the foreign diplomatists with whom he was brought in contact.

On his return from his mission to Peking, Okubo, with Ito, devoted himself to bring about a reconciliation with those officials who had resigned office; and with this object in view he met Kido, Itagaki and Inouye in Osaka and succeeded in persuading Kido and Itagaki to return to Tōkiō, where they were reappointed *Sangi*, and these, together with Ito, were appointed a Commission to suggest a future line of policy for the Government, which should guarantee it against such shocks as that of the Saga rebellion. Kido's views, we know now, inclined so far in the direction of representative Government, as to lead us to believe that he would have prepared the road to Republicanism; but the Report of the Commission went only so far as to recommend an attempt to inaugurate a system of Representative Government under a constitutional Monarchy. In accordance with this report, an Imperial Edict was promulgated on the 14th April 1875, which we quoted, in our issue of the 4th inst. in a note to an article from the *Choya Shimbun*—'The Pretence of Constitutional Government.' This created two deliberative and legislative assemblies, the *Gen-rō-in* and the *Dai-shin-in*, and promised that their members should be representatives from all parts of the country. But Okubo appears to have thought the time yet immature for such a radical change, and with the excesses of similar assemblies in France on the record of the last hundred years, we cannot say he was unwise. Then Kido, who was the great advocate for representative Government, was compelled, by failing health, to retire from active life, the Mikado's promise of 1875 was evaded, and in 1877, Satsuma burst into a blaze of civil war. Whether, if Okubo had been better trusted by this powerful and arrogant clan, he could have gradually educated the people into fitness for the liberty demanded, we shall never, now, know; there seems good reason to believe that—despairing of their remaining quiet and fearing lest they should grow too strong for ultimate control—he took, at least, no precautionary measures to prevent the outbreak, if he did not purposely invite its explosion. The history of this period of Japanese history has yet to be written.

But this we know: that immediately the storm burst, he took the helm of the vessel of state, and boldly guided her into port, though with an almost mutinous crew. It is certain that his colleagues would have been content to resign, rather than push matters to extremity, and have admitted to power a new Ministry, with Saigo as their nominal chief. Foreigners, at least, and all interested in foreign trade, have reason to be grateful to Okubo for standing firm. That a retrograde policy in the country's foreign relations was to have been the leading principle of such a Cabinet is clear from Saigo's manifesto, and from the documents just published by the slaughterers of Okubo in attempted justification of their crime. His firmness prevented the calamity. At the outbreak of revolt, he proceeded at once to Kiyoto, where the Mikado was 'on progress,' and remained there, happily supported by his Sovereign's favour, and so inspiring his colleagues and subordinates with his own dauntless resolution, that the dreaded clan of the South were faced, checked, out-maneuvred and finally crushed. That he possessed the full confidence of His Majesty was evidenced by the honour

bestowed on him, on one occasion during this period—trivial to Western minds, but very significant here—of a cup of wine being presented to him by the Emperor's own hand, the cup having just previously touched the Imperial lips.

Two days after the Sovereign's return to his eastern capital,—Okubo, having completed the work of stamping out the revolt, followed him, and has since, in Tōkiō, devoted himself to the task of healing the wounds inflicted on the country by the civil war. He has liberally used the Government funds, and largely supplemented them from his private means, to ameliorate the condition of the sufferers, rebuilding burnt towns and villages, distributing aid to impoverished farmers, and endeavouring, by tempering justice with mercy, to conciliate the beaten clan. He has also occupied himself in promoting new manufacturing and other industrial enterprises, which have been assisted by subsidies and other means, and has also taken an active personal share in the work of preparing and dispatching the exhibits from Japan for the great Paris show of 1878. At the early age of forty-two, this useful career, this active life, have now been brought to a sudden, violent end.

From the above brief and imperfect outline of his life, it will be seen that Okubo Toshimitchi was one of the most prominent men engaged in the Restoration struggle, and certainly the leading spirit of the Cabinet since its triumph. His name deserves, not only the posthumous honours bestowed on it by a grateful sovereign, but that it should be placed high in Japanese history and live in the memory of his countrymen. To his firmness of character and breadth of view, to his tact and prudence, to his intelligent appreciation of Japan's new position amongst the nations, and to his not less intelligent valuation of Western ideas and inventions, are to be attributed the facts that Japan has made startling progress in a new civilization, and that she has been spared some at least of the inevitable evils which are inseparable from any violent change in the polity of a nation, as in the habits of a man. These are great benefits for any statesman to confer upon his country. To these, he has added great sacrifices. When overthrowing the feudal system, when crushing provincial revolt, when encouraging trade with foreigners, and fostering the naturalization of foreign arts and sciences, he was setting himself—and he knew it—in opposition to national pride, prejudice, feeling and tradition, to promote what he justly deemed the nation's good. But he had first to surmount prejudices in himself, based upon the teachings of his infancy, on the precedents of generations of his family, on the whole method of life of his associates. He had to cut himself loose from ties of an almost sacred character, to break with cherished friends, to incur not only the scorn and hostility of his clan, who regarded him as a traitor, but to brave the enmity of the great majority of his countrymen, who failed to appreciate his motives. He has now, by the involuntary sacrifice of his life, completed the sum of possibility, and his friends have left to them the task to guard his memory from slander. He appears to have disdained to guard his body from the assassins' steel.

It may be—it has often been—said, that ambition, love of power, greed of gold, were the ruling motives of the dead statesman's conduct. The same are attributed to his colleagues. This is one of the penalties of place. It has been alleged against him, that he forced on the Satsuma rebellion, that he attempted to procure the assassination of his former friend, that he let loose the dogs of war on some of the Empire's fairest provinces,—rather than resign his place and its emoluments, and sink into the luxurious obscurity of the 'joyous life' to which the warm, sensuous nature of the inhabitants of these islands naturally inclines. He has been accused of enormous peculation, of diverting the monies of the state to his own purse,

under pretence of subsidizing new industries. To what end? He has lived in no Palace of Pleasure, wasted no substance in either ostentatious banquets, art collections, or expensive foreign travel. The simple and frugal way in which live the high officers of state in this country excites the wonder of every intelligent visitor. Their residences are such as in Europe are occupied by the middle classes, and their whole method and habits of life seem to harmonize with their unostentatious dwellings. When, in addition, we reflect that each one of them, as a leader of the van of attack against deep-rooted prejudice of the hoariest antiquity, must be fully conscious that he moves in hourly danger of death,—and in such danger as only exists where men are content to go laughing to the Silent Land, if but one successful blow has sent an enemy to precede them on the dark path:—when we add this to the cares of office, its emoluments seem to shrivel into dry leaves like fairy gold, its power seems but a mockery, its enjoyment null. A sense of duty, overwhelming, mastering all other considerations, supreme, seems to us to give the only clue to the enigma why men should seek, or hold to, office, in New Japan. With one solitary exception, not a single one of the statesmen who guided the revolution of 1868 to a successful issue has died in his bed. Kido went peacefully to his eternal rest, with 'honour, love, obedience,—troops of friends,' to smooth his passage into the Land of Shades:—but the rest, all Councillors of State or members of the Cabinet—Yokoi Hachiro, Oomura Masuji, Hiro-sawa Hiyoki, Yetô Shimpei, Mayebara Isei, Saigo Takamori—where are they? Mouldering all in bloody, some in dishonoured graves—dead by the hands of assassins, or the executioner, or on the battle field. No great incentive to ambition here,—to live a life without leisure, and to look, through an avenue of the tombs of friends, upon a not distant grave. That Okubo appreciated his responsibilities, knew his danger, and acutely felt his forced separation from the associations and friendships which give to life its chiefest charm, his demeanour showed to all who knew him well. But duty with him was before all. During the height of the rebellion of last year,—before Fortune seemed inclined to smile upon the Imperial arms,—speaking to a foreign friend, of the death of an intimate companion who had fallen in the field, Okubo expressed envy, not regret. 'He died as he wished to die,' he exclaimed, 'doing his duty—and how could he die better? Would I had been in his place, but duty keeps me here—my friend—here by my Emperor's side. A time may come?'—He little thought how soon. He, too, has fallen; fallen in the harness of duty, though not his the fiery joy of strife; for the rallying trumpet note, or the triumphant shout of victory, to his failing sense came only the assassin's vengeful curse; but with him at the last must have been the same consoling thought that—so far—his duty had been done. He is gone. His Emperor mourns and honours him, a time will come when his countrymen will know him for what he was,—and his friends must be resigned.

FIRE INSURANCE IN JAPAN. II.

WE HAVE now before us the remainder of Dr. Mayet's paper on collective and compulsory insurance in this country. The author concludes his labours by what he calls a 'critique' of what has gone before, but which is rather a summary of the facts and figures he has grouped together, and a statement of corroborative arguments. We are not left quite so sanguine of the success of his scheme, after reading this, as before.

A very obvious objection to the value of his statistics must be apparent to every reader: that—the figures of only two years,—they are quite insufficient data on which to found a proper estimate of the necessary amount of premium or house-tax. When we consider the voluminous

and minute statistics, spreading over a large number of years, which are thought necessary, by English actuaries, to enable them to construct the requisite tables for insurance of life, house property or shipping,—it is at once apparent that the statistics of only two years—and of two years in which the number of fires differs so widely as in Dr. Mayet's tables, cannot afford any proper basis for fixing the amount of a house-tax. Our author appears to be aware of this, himself, for he purposely over-estimates the damages done by several causes of destruction, and his figure of one per cent (actually 0.9477) was confessedly a maximum. In the second part of his essay, in a Note which is valuable, as fixing for us the population of these islands at 34,338,367, he pares down his figure of premium to 0.8707, and might reduce it still lower, as certainly destruction by wind, water and earthquakes, may to a great extent be diminished from the figures assigned to them, and destruction by war may now be almost altogether eliminated. But on the other hand,—when comparing Japan with other countries in the matter of destruction caused by fire, Dr. Mayet's line of argument is by no means convincing. For he tells us that 'though the Japanese are careless with fire, they have fewer conflagrations than we have' and cites several dangers special to foreign-built houses and habits, such as open fire places, the use of bad lucifer matches 'which break off when struck,' uncovered lights, curtains, and the 'drying and steam-rooms of manufactories.' From these special dangers, he claims that Japan is entirely free. But how long is the country to enjoy this immunity? It is perfectly clear that, were the government to adopt his suggestion and become the insurer of the people's houses, its first duty would be to prevent the terrific spread of fires, by rebuilding all houses burnt down—not in the old Japanese fashion, with wood and straw,—but in brick. Private enterprise is already doing this to a small extent, and where we find brick or stone used as material, we find foreign houses taken as the model, with chimnies, open fireplaces, foreign furniture and curtains—complete. The inclination of the upper and middle classes is decidedly towards abandonment of the old ways, and imitation of Europe in dress and habits of living. Lucifer matches, again, have got a very decided footing in the country, and the flint and steel, and the live coal, will very soon be things of the past. As for the 'badness' of the lucifers,—as the Japanese are manufacturing them for themselves, a few years' statistics will soon show Europe to be in a better position in this respect. As for the dangers from candles, or other means of lighting, Dr. Mayet omits all mention of kerosine lamps, which are coming into quite general use here, and which are probably, of all means of illumination the most dangerous, and the figure of destruction from which will have to be alarmingly increased, as the Japanese begin to use their own home-prepared mineral oil, instead of the carefully refined foreign article, in which the danger of spontaneous combustion, at all events, is nearly nullified. The very worthy ambition of the people of Japan to become a manufacturing nation is fast introducing factories and machinery of every description, with all their concomitant dangers of 'drying and steam rooms'—while other national qualities, not quite so laudable as ambition, make the figure of danger from these causes much higher than with ourselves, who thoroughly understand machinery, take proper precautions against special dangers, and do not leave steam engines to run by themselves, as happened the other day at a paper mill in Tokio, when the bottom was knocked out of the cylinder while the engineer and his comrades were sipping their tea, or smoking their pipes.

But to pass from minute criticism of a scheme which, after all, perhaps, the author puts forth as merely tentative, and which—certainly—requires far more extended

statistical tables, covering a long series of years, as a base on which to calculate a new, universal and important tax; there are two very great objections to Dr. Mayet's proposal which must at once occur to any one conversant with Fire Insurance business, and specially so in Japan. We do not so much quarrel with the amount of his proposed house-tax—one per cent, because—though, under our voluntary system in England, one-eighth per cent is about the average premium,—still, for the present, at least in Japan, until some great ruler has arisen who has found his cities built of wood and straw, and left them of brick, the risk of fire is not over-estimated as being eight times as great as in England, especially when such earthquakes and inundations as Dr. Naumann tells us of, and a few trifles of typhoons are thrown into the bargain. But we think that the learned author of this paper has made a grievous mistake in proposing to tax every house alike, the solitary cottage on the moor, the ancient temple in the forest, and the house in the crowded street of Tōkiō or Osaka. One per cent to insure a house in the capital against fire, earthquake, war or typhoon! To house owners who count the life of a house seven years, who expect,—and seem to take care to get it,—a conflagration that destroys square miles of streets every revolving decade, when the year of the Tiger, or the month of the Flying Dragon, comes round—one per cent is indeed a cheap rate of insurance! Fifteen per cent is about what an experienced insurance actuary would ask for insurances in the business quarters of Tokio. While, to tax with one per cent the temple that has stood unharmed for centuries, where no fire beyond that which slowly consumes the smouldering incense stick is seen from dawn to dusk, or the grey old thorp, that has sheltered generation after generation of farmers whose expenditure in 'uncovered lights' is met by the few *sen* which purchase the oil and rush-wicks for the night lamp—to equalize on these the tax whose product is to rebuild burnt towns, this would be indeed injustice, which no correlative or consequent advantages to trade or credit, would out-weigh. Dr. Mayet must more minutely examine and divide the police statistics and tell us what percentage of fires occur in towns and what in the country, and properly apportion the risks and the premia, before he can reckon on support for his scheme from press, Government, or people.

Another fatal objection to his proposals is that he concerns himself with the houses only, and not at all with the property stored within them. The insurances effected under the voluntary system on goods, furniture, and other property exceed, we expect, those on the mere buildings which contain them. But, by making Government the general insurer on buildings only, and compelling the people to insure their buildings alone in the Government office, you take away from voluntary enterprise a large part of the inducements to start private insurance offices. This is of itself a great evil, and we do not imagine that Dr. Mayet will propose to the Government at any time to extend its business to the insurance of goods. Better to accumulate and publish the statistics, and then leave the whole business to the growing common-sense and appreciation of foreign example which is already in many ways improving the condition of Japan.

We have not space, to-day, to make more than one or two practical suggestions to the Government likely to be of any use in mitigating the undoubtedly enormous evil of danger from fire in the cities of Japan. But part of its largely redundant police force might surely be excellently well utilized as fire-brigades drilled in foreign fashion, and taught to put out fires instead of posturing in ridiculous armour on the roofs of houses, pulling off tiles to let sparks in amongst the dry rafters. A small amount of money might very usefully be spent in sinking firewells and replacing the native squirts by effective foreign en-

gines. And, particularly, surveyors should be appointed to superintend all new buildings, and where possible in old ones, to see that fire proof walls, at short intervals, are built to break up rows of houses into separate fortresses against the dreaded foe. Government might thus assist private insurance offices and there would be no objection, even, to its going further, and helping their establishment by lending, on easy terms, a portion of their capital or guaranteeing them, for a short term of years, against bankruptcy by the occurrence of an exceptionally disastrous year early in their career. But on the whole, we cannot recommend Government to commence business as insurers, or support the proposal to levy a one per cent house duty upon cottages and farm houses; and therefore, fully recognizing Dr. Mayet's industry and ingenuity, we must regretfully decline to give to his scheme the infinitesimal assistance of our support.

THE OPENING SEASON AND BLACK TEA.

OUR Spring carnival, the meeting of the Yokohama Jockey Club, being happily over, we can again occupy ourselves with matters of commercial importance, with some chance of getting a hearing; and very prominent among these is the opening of the Tea season of 1878-79. This is especially interesting to us, on account of the persistence shown by the natives in prosecuting their experiment in Black Tea making, which we have more than once deprecated as likely to result disastrously. We cordially hope—an unusual statement for a journalist to make,—that the end of the campaign may prove us to have been wrong in our opposition: but that opposition has been manifested quite disinterestedly, and in perfect good faith. Foreign commercial interests generally are so intertwined with native, that for the native tea trade to suffer a really heavy blow cannot fail to affect ourselves in a not remote future, and—setting aside sentimental desires to see Japan making progress, which we have never pretended to formulate as a chief actuating motive—the greater weight should be given to an honest expression of conviction, when we acknowledge, as we do in this instance, that self-interest, general benefit to the trade, which includes the particular benefit of foreign tea-traders, has been the object that we have had in view in opposing what may seem a too conservative front to the desire to make an experiment, with a view to the extension of the export trade. The notification by the Naimusho was evidently actuated by this desire. Setting forth that prices in the American market had so fallen that, though the export thithor of Japan tea had largely increased, no commensurate profits had been made, and evidently anticipating the danger of even this market being lost, and the consequent necessity of seeking others, the Minister urged that an attempt should be made to manufacture Black Tea which might be put into competition with the produce of China and India in the far larger and more numerous markets of Europe. No small amount of trouble and expense was incurred by the Department. Commissioners were despatched to China and India, to enquire into the methods of preparing Black Tea in these countries, and the results of their investigations were collected and published in the form of Instructions, which have been circulated though the tea-districts. Experiments on a sufficiently large scale were also made in the Kōchi ken and small sample consignments were made in various directions and foreign reports on the leaf procured. We believe that some of these reports at least were favourable, but we much fear that sufficient weight has not been given to the point which must have been made in all such, that the tea would be saleable *at a price*. This question of price is of course the crucial one, and the reason why we have unswervingly opposed the experiment being made on a large scale is, that we are of opinion that this is the main

point where the experiment will break down. It must also be borne in mind that some, at least, of these small preliminary experiments have been made under skilled foreign direction, European and Chinese, that the teas were finished and packed up-country and shipped direct to their destination, where they were at once tasted and reported on. It must, of course, be manifest that these are very different conditions to those under which will be despatched the bulk of that portion of the crop of 1878-9 which the Japanese tea growers now propose to make into Black Tea. The tea will be prepared, without all the elaborate care and skilled aid devoted to the samples made last season; we do not anticipate that native merchants intend shipping on their own account, and, consequently, the teas must undergo inspection—and, as we pointed out in a former article, very minute inspection, box by box,—before shipment by foreign buyers; it must consequently either carry the expense of re-leading and re-packing, or—sent down unpacked,—will so suffer *in transitu*, that its aroma will be materially impaired, and it will have to be re-fired in Yokohama before shipment. On the one hand, it would suffer an increase of charges, on the other a decrease in quality. Native tea growers, therefore, who may attempt to follow the Government's advice, must find themselves on one or other horn of this dilemma, and we seriously fear will be tossed by either into the Slough of Despond.

We are anxious to give to our opponents in this matter a thoroughly fair field, and we therefore quote a letter just received from the Editor of the *Produce Markets Review*, a weekly newspaper devoted to the interests of the Grocery Trade of Great Britain, and a very high authority upon Tea. This is a perfectly independent and unsolicited report on the new Teas, and as such is probably of greater value than most of those received by the Government itself. The writer says:—

"The Japanese Government finding that Japan Green, or uncoloured Green, Tea, does not sell here, though England is the great Tea mart of the world, has recently had a few samples of Black Tea prepared which are admirably adapted to English requirements. In China some Teas—the Taysan kinds—formerly not esteemed here, and which were weak like Japans, have been vastly improved of late years, and are now in great favour. The Chinese have in this case adopted some of the changes introduced into Tea-making by our planters in Assam, and if the Japanese Government want to improve the strength and pungency of their Teas, they should enquire into the way the best Indian Teas are made. The chief difference between the processes adopted in India and China, is, we believe, that the juice is not squeezed out of the leaves in the former country:—"

But here, too, it will be remarked that the writer, knowing nothing of the cost of preparing the Tea and omitting to put a London market value upon it, drives us back upon the question of cost *versus* sale price, which is after all the *cruz* of the venture. Experts here—as will be seen by reference to our Market Report on another page, put the Tea now shown among the good medium grades of Congous and do not put upon it any better value than a shilling a pound; and at this price we have a sufficiently full conviction that shippers will come out with a loss, to induce us to advise foreign shippers to abstain from sending other than experimental parcels, and most strongly to recommend our native friends to give up the attempt to make it at all.

One other point which makes strongly against these new Blacks is referred to in our Market Report, and should be insisted on here;—the fear that it will deteriorate rapidly in store. We do not anticipate that the first shipments which go forward will be in sufficient quantity to suffer from this defect: the London tea-trade is a large, a rich, and an enterprising one, in both its wholesale and retail branches, and the first Japan Blacks will be curiosities in

their way, which will be bought by a large number of dealers in small parcels, without much regard to profit and loss. There is enough curiosity existent, too, in the British tea-drinker, generally of the sex to which is attributed the largest share of that valuable incentive to the acquirement of knowledge, to ensure the rapid sale of the well-advertised, novel, Japan Black Teas for a fortnight or three weeks. But we venture to predict that no mistress of a British tea table will buy more than her first pound, and, unless it happens that it mixes, in some unforeseen and unexceptionally favourable way with better Tea, the succeeding shipments of the season will hang in first holders' hands, and then will begin to operate with heavily damaging effect, the defect that it keeps badly in warehouse. It is obvious, too, how this will tell upon it in our own market, as the season progresses in Japan.

The only comfort we can extract from the situation is that if, as we are told is threatened, the whole second crop is converted into Black Tea, the now heavy stocks of Japans in America will be worked off without much addition to them from this side of new Teas, and that a consequent rise in prices will give to foreign buyers and holders profits which have too long been only only traditional: but unfortunately for the Japan tea trade in America, scarcity or absence of supply will let in Formosan Oolongs to such an extent that it will be doubtful whether,—after Japan has learnt her bitter lesson of loss and experience, in trying to find a new market,—she will not discover that she has altogether lost the old one. The fable of the dog and the meat-shadow is as true now as when *Æsop* wrote, thirteen hundred years ago. Japanese tea-men should read it, and perpend.

A PORTUGUESE gentleman has been good enough to send us the following translation, from the *Diario de Noticias* a Lisbon journal, of the very remarkable escape from a watery grave, of a quartermaster of the *Africa*, a Portuguese transport which our readers will remember as having visited these waters last year. Januario Gomes, the sailor in question, is allowed—or readers will remark,—to tell his story in his own plain fashion. The contributor to the *Diario*, who sends his account of his accident and almost miraculous salvation to the newspaper, prefaces it thus:—

"Januario Gomes is the name of the quartermaster of the Portuguese transport 'Africa' a most intrepid sailor of our navy, who without being a Boyton, or indeed a swimmer of any particular note, yet managed to 'loaf about' on the waves of the Mediterranean, during nine consecutive hours. He is now back from China, whither he had gone with his ship, having had, during the whole of the commission, only five days' leave—those which elapsed between his falling overboard near Carthage, and his reporting himself on board at Port Said."

After this introduction, the writer proceeds to give Gomes' account of his accident in his own unvarnished words, as thus:—

"It had not gone six bells on board the *Africa*, that is, it was not quite three in the morning, and I had to be on watch at four. I was obliged to get up and go to the fore-castle. I was not sleepy at the time. The ship had no sail set, but was going well under her engines only, at full speed. I slipped and fell, I know not whether from giddiness or from the rolling of the vessel. I know only that I sunk, and that when I returned to the surface, I saw the ship about two cables' length away, I shouted, and shouted a good deal, but could understand that I was not heard on board. This is not to be wondered at. The bridge crosses the middle of the steamer, and on it stood the officer on the watch. The noise of the machinery and the beating of the screw would not permit his hearing my cries for help, I therefore swam, unceasingly; preserving always the same position, the chest in the water, with wide opened legs and arms.

"The darkness of night was dispelled, and the day

"broke clear and fine. When I calculated from the height of the sun that it was 8 o'clock, I distinguished, at a great distance, the smoke of a steamer. I lifted one arm, then another, but to no good. I then tried to get rid of my clothes, a pair of trousers, a shirt and an undershirt, and felt that weakness was gaining over me. My left leg bent with difficulty, and my teeth got tighter and tighter. I gave up the idea of swimming, and allowed myself to go with the current. It was perhaps 10 a.m. when I saw another steamer, also *au large*. I made the same telegraphic signs, with arms and legs out of the water. She passed me unnoticed, and left me more miserable than before I descried her. I then thought to myself: it is sure I must die in the sea; perhaps in a couple of hours, it will be all over.

"Scarcely that time had elapsed when another steamer goes past. I made new signals, and made a last effort to rise. I was discovered, I was saved. The steamer twice whistled, and as there was no fog, it was consequently a sign of help 'Courage, sailor' might have been the meaning of the whistling.

"I must say I felt I had more of it then, than on any other occasion, and quietly waited for assistance. The steamer steered towards me, a boat was lowered, and feeling myself lifted, I closed my eyes, and felt thoroughly exhausted. It was then twelve o'clock."

The *Diario's* correspondent concludes by telling his readers that

"The saviour steamer was the "Penguin" of the firm "Leite & Co., commanded by a good sailor, with an excellent heart. We cannot help registering his name. Joseph "Dowdy."

The *Penguin's* people having picked up their man, found him naturally in a state of exhaustion; but by dint of rubbing his body with brandy, and administering the same medicine internally, they gradually brought him round. A few hours of slight fever, accompanied by delirious symptoms supervened, but Captain Dowdy seems to have been as good a medico as a skipper, and very soon put Gomes on his legs again. After touching at Malta, and experiencing the disappointment of seeing the smoke of the *Africa* on the horizon, that vessel having sailed an hour or two before the *Penguin's* arrival. At Port Said, however, the latter ship cast anchor four hours before the *Africa* arrived. Then occurred an opportunity for the health officer of the Khedive to give a surprise to the commandant of the Portuguese man-of-war. Going on board he asked the usual questions. To the query 'How many men have you in your ship's complement' he received the reply 'Four hundred and eighty.' 'I beg your pardon, you have one more.' 'I cannot admit that,' replied the Captain—'I know perfectly well the number of my men.' 'Well in this case, you are mistaken, for you omitted to include your boatswain.' 'I know it'—was the reply—'but unfortunately he fell overboard and is probably dead.' 'Not so, Sir,—pointing to the *Penguin*, 'you will find him there.' This is not so dramatic an incident as Peter Simple reporting himself while the auction was going on of his effects, and Captain Hawkins was cracking his brutal jests over the supposed dead man's trousers, but the incident must have enlivened the monotony of the Egyptian's daily work, and the joy and surprise of Gomes' comrades may be imagined.

COLLECTIVE INSURANCE OF BUILDINGS IN JAPAN.

(A paper read before the German Asiatic Society—April the 13th, 1878. By Dr. P. MARET.)

(Concluded from our last).

IX.—CRITIQUE OF THE RESULT.

IS the result at which I have arrived a probable one? In view of the increases which I have made in each case, this question may properly be restricted. That relating to the premium for earthquakes, inundations, gales and war, will not appear too small; and I shall therefore only inquire, is the result a probable one, so far as the number of houses consumed by fire, is concerned? I am of opinion that it is, for the following reasons:

1.—The statistics given on this subject are official and appear trustworthy. They exhibit, for both years, a systematic distribution of the conflagrations; and there are sufficient reasons for the difference in the numbers of houses destroyed.

2.—Another official table of statistics gives a remarkable, and quite unintentional confirmation of the first table. According to the sixth report of the Imperial Japanese Postmaster General, for the fiscal year July 1st, 1876 to June 30th 1877, 3,744 post offices existed in the whole Empire, of which 27 were destroyed by fire. If we recollect that, in the fiscal year 1st July 1876 to 30th June 1877, the insurrections in Kumamoto and Hagi, and various peasant revolts and the beginning of the Satsuma insurrection occurred (in the last, between the 15th February and the 21st June, in Kumamoto alone 17,055 houses were destroyed) it will be evident that more than 3 post offices were destroyed by fire occasioned by war. If we deduct only 3 as the loss by war, the average destruction of post offices will be in the same proportion as the general destruction of houses in Japan. 24 post offices destroyed in a total number of 3,744 gives 0.6410 per cent for the post offices, and according to the police statistics for the same period 44,085 houses or 0.6354 per cent were destroyed in a total of 6,938,255 houses. This last result consequently seems correct and not at all too small.

3.—One of the Tokio papers, the *Yomi Uri Shimbun*, has made a very decided attempt to report on each conflagration in Japan. It procured information by letter and telegraph from every part of the country; it even mentioned 187 fires in the course of two years, which were put out; and 516 in which only from 1 to 10 houses were destroyed. In each case the name of the province, district, town or village and street, together with the number of the houses and the name of the proprietor, are exactly given. It records accurately the number of houses and fire proof storehouses, and what public buildings were consumed; and also the number of persons killed and wounded in each case. Nevertheless it mentioned in the two years 1876-77 only about 867 conflagrations, or the twenty second part of the number reported by the police. The reports of the latter appear therefore very complete.

4.—The proportion 0.6354 per cent, as that of burned to unburned houses is probable *per se*. Let us compare it with European statistics.

PROPORTION OF INJURY TO THE AMOUNT INSURED.

In France,* 1871.....	0.0395 per cent.
„ Do. 1872.....	0.0380 „
„ Germany,† 1877.....	0.0925 „
„ Norway,‡ in the country 1845-74 incl....	0.1465 „
„ Do. in the towns id.....	0.4744 „
„ Japan, 1876-77	0.6354 „

The proportion for Japan is sixteen times that of the proportion for France; seven times that of Germany, four times that of the country in Norway, and one and one third times that of the towns.

In a rich country like France, the houses are mostly built of stone, in Japan they are of wood, straw and paper, hence the danger is sixteen times greater here.

In Germany, the houses are chiefly built of stone, but in the villages the houses are much more frequently roofed

* See Wallmann's German Insurance Calendar 1874 p. 265.

† In the twenty old French fire insurance companies, which on the 31st December, 1872 assured to the amount of 75,166,987,472 francs:—

	1871.	1872.
The proportion of the premium to the amount insured.....	0.0915 per ct.	0.0896 per ct.
The proportion of the damage to the premium	43.13 „	42.42 „
Hence the proportion to the amount insured.....	0.0395 „	0.0380 „

‡ Augsburg Allgemeine Zeitung. Handels Beilage No. 21 1878.

According to an approximate estimate, property, moveable or immoveable, to the amount of 60,560 Millions of Marks is insured in the German Empire. The premium for this amounts to 108 Millions of Marks or 0.1783 per cent of the value. The amount of damage was 56 Millions or 0.0925 per cent of the insured value.

‡ Le Royaume de Norvège et le peuple Norvégien, par le Dr. O. Broch; Président de la Commission Norvégienne pour l'exposition et le congrès d'hygiène et de sauvetage à Bruxelles 1876. Christiania 1876 page 113, and in annex p. 70. In Norway there is a general insurance office, with distinct departments for the towns and the country. The statistics communicated extend over thirty years.

with straw and shingle than in France; they are on the whole not so safe as those of France, and hence the Japanese houses are seven times more liable to fire than those of Germany.

In Norway, the towns and villages are built of wood, as in Japan, and therefore the Japanese proportion approaches most nearly that of Norway. The Japanese house of wood, straw and paper is four times more liable to fire than the houses of the Norwegian peasantry, and one and one-third times more liable than a house in a Norwegian town.

The French, German and Norwegian data seem to support the correctness of the statistics of the Japanese fires.

5.—The difference just cited between Norwegian towns and villages, viz: that the former suffer three times as much injury as the latter, leads us to conclude, that towns built of wood are more liable to fire for each individual house than villages built of wood. In a town, in proportion to the number of houses, more fires break out than in a village. Each of these fires is not only dangerous to a space as large as a village but also to the houses in distant places. The extension of wood built towns is of itself a circumstance highly dangerous in cases of fire. When the latter has once reached a certain point, it can, if favoured by the wind, reach every house. It produces such a heat that fresh houses can be set on fire by the heated air which is carried away, without direct contact with the fire itself. The foreigners in Japan live only in large towns and are witnesses of fires which are most violent and destructive, and receive therefore the general impression which is not borne out by statistics which take the whole country into account: that the liability of Japanese buildings to catch fire is so great that no reasonable or moderate premium would suffice to cover the risk.

6.—Although the Japanese are careless with fire, they have fewer conflagrations than we have, and for this there are various reasons. The *hibachi* is dangerous to their dress, but the open fire places of the English and French are still more dangerous for the clothing of foreign ladies. More than 10 per cent of our fires are chimney fires, caused by the false construction of the chimney—according to a statement* of Mr. Bock, the chief of the fire-brigade in Stettin, there were in that town during the 11 years 1865-76 incl. 663 fires, 212, or 32 per cent of which were chimney fires; in this country where there are no chimneys we have not this class of fires;—about 6 per cent of our fires are caused by bad matches which break off when struck; here people use flint and the live coal for lighting—About 7 per cent of our fires originate from uncovered lights, the Japanese are accustomed to use lanterns in going from place to place; they have no curtains in their rooms to catch fire.—About 10 per cent of our fires originate from lightning and this occurs but very seldom here;—in 1,200 cases of Japanese fires which I have examined, I have only found 6 or $\frac{1}{2}$ per cent, in which lightning was the cause. Coincident with this Mr. Knipping found only 33 thunderstorms in Tokio or an average of 6 to 7 a year for the five years 1872-77. Dr. Geertz says: "Thunder and lightning are rare in Nagasaki."† Dr. Hepburn‡ referring to the years 1863-69 incl. for Yokohama, observes: "thunderstorms are neither frequent nor severe." Moreover in Japan we have none of those fires, which occur in the drying and steam-rooms of manufactories, and which are so common at home.

For the six reasons above given I am of opinion that the average number of houses burned down, which I have arrived at is sufficient, and that the amount of the premium, namely 0.9447 per cent, founded thereon is ample for the insurance of Japanese houses against all these dangers.

[NOTE:—In the interval between the reading and the publication of this paper, I have been furnished with a new proof that the premium of 94½ *sen* per 100 *yen* is taken sufficiently high. I am in a position to communicate here some interesting statistics to the point from the unpublished tables of the census which was taken on the 1st January of the ninth year of Meiji (1876):

1.—On the 1st January 1876 Japan had 34,338,367 inhabitants; taking as above 4.9 inhabitants for each house we get 7,007,830 houses. Taking then as above, the expenses expressed in houses to be 65,547, the necessary pre-

mium becomes 93.53 *sen* for every 100 *yen* of value insured, that is, still less than the 94½ *sen* found above.

2.—Japan had on the 1st January 1876 households, (*Kamado*)

- a. Of Japanese residing in their native places..... 7,208,122
- b. Of Japanese who do not reside in their native places 84,964

Total..... 7,293,086 households

If we regard this number of households as the number of houses, we get 90.12 *sen* as the premium for 100 *yen* value insured, that is, a smaller sum than the 94½ *sen* already found.

3.—Now if we include the number of temples on the 1st January 1876 we get:—

Shinto temples..... 162,782
Buddhist temples..... 71,962
Kamado..... 7,293,086

Total..... 7,527,830 temples and Kamado.

Taking this as the number of buildings obliged to contribute, we get only 87.07 *sen* as the premium for every 100 *yen* of value insured, that is, still less than the 94½ *sen*.]

X.—ONE OBJECTION AGAINST FIRE INSURANCE

used to be that it made incendiarism more frequent.—It is true,—but only for those places where there is no sufficient police protection against *over* insurance. Thus originated the epidemic of incendiary speculation in the Northern States of America during the stagnation of trade between the years 1862 and 1866. Before the war, loss by fire was about 22 Millions of dollars yearly, in 1865 60 Millions and in 1866 it reached the enormous sum of 100 Millions. During this period 1862-66, 1837 fires took place in New York, of which 678 or more than $\frac{1}{3}$ of the whole were proved to be due to incendiaries*. In consequence of this as Jacobi† observes, "America is now making extraordinary experiments of excessive police supervision in fire insurance."

The two most simple legal means which are completely adaptable to Japan are 1st. compulsory *under*-insurance and 2nd., rendering rebuilding obligatory.

Insurance against fire would not be permitted to the full value of the house, because no one would set fire to his house in order to lose by it. Thus, in the last century, the insurance-offices of Saxony insured only to the extent of $\frac{1}{4}$ of the value of the moveables. Moreover compensation would only be given as the work of rebuilding proceeded. Thus rebuilding is an indispensable condition in the offices of most of the German states.

With a vigorous enforcement by the police of these two conditions, namely *under*-insurance and rebuilding, there would be no cause for apprehending an increase of the crime of incendiarism. On the contrary, if the proposed insurance is carried out, a decrease of crime may be expected, because there would be no longer, as there are now, several tens of thousands of families impoverished by fire, earthquakes, inundations, storms and war. It is known from the experience of all countries that the ranks of criminals are largely recruited from people who have been thrown out on the world by misfortune.

XI.—THE JAPANESE GOVERNMENT AS INSURER

The first part of my paper impressed the utility of insurance, the second showed its possibility, the conclusion will briefly mention some reasons for the institution by the government of collective insurance.

1.—The State, the organisation of which extends already to the most insignificant places and which has its police, its administration and tax collectors every where, can most cheaply assess, administer and collect premiums; and examine, estimate and compensate for damages.

2.—All the profit which the State makes in insurance is so much gain to the community. The State is therefore nothing else than the cheapest and most extensive of all possible mutual insurance companies. It could bear any damage above the average, however large, which may occur before the formation of a sufficient reserve fund; it could make the necessary advances and distribute them over

* See R. v. Fischer Treuenfeld's—Fire Telegraphs. Westminster 1877 p. 41.

† Transactions of the Asiatic Society Vol. III, Part II p. 50

‡ Do. Do. 1874 p. 245.

* Vide L. Schmidt. Das ganze des Versicherung's wesen—p. 80.

† Supra. 'Japan Times' of May 11th, 1878.

subsequent years, so that the individual inhabitants would nevertheless not be overtaxed on account of the occurrence of an exceptionally unfortunate year, soon after the foundation of the insurance,—a case in which any private company would become bankrupt. In Norway, for instance, in the course of thirty years there was an unfortunate year (1866) in which five times the average destruction was wrought.

3.—The State, in case it permitted of private companies, could hardly exercise less activity on the part of the police than if it were the insurer itself. The police supervision which the government in Germany, for instance, exercises in the matter of fire insurances is considerable.

4.—Police, fire brigades and the construction and repair of embankments are entirely in the hands of the government. Every improvement of these would otherwise give profit to a private company, but in the way I propose, the saving and preventing of misfortunes would be of direct value to the finances of the State.

5.—By the establishment of insurance in the manner I propose, the State would also improve its finances in many other ways. The insurance would have had to bear in 1877, for instance, about Yen 94,000 expenses of extinguishing fires; Yen 599,922 for war damages in Kumamoto *ken*; Yen 657,738 in Kagoshima *ken*, also the donations to the Miyazaki and Oita *kens*—that is, altogether much more than Yen 1,350,000. It would have, besides its ordinary utility, the value of a new tax which would not be unwillingly given. If the average premium were fixed at 1 per cent instead of 0.9447 per cent, the exchequer would receive a yearly profit of about Yen 150,000. If there were a regulation to the effect that not the whole, but, for instance, only $\frac{1}{2}$ of the damage caused by fire should be repaid, an amount of $\frac{1}{2}$ of the average yearly destruction of houses by fire, that is a quarter of 44,000 houses or 11,000 houses, or at least Yen 385,000, would be saved. Both these receipts would therefore bring the State Yen 535,000. The insurance would in reality, be a house tax which could be very considerably raised by a moderate increase of the premium for town houses. By a taxation of the premiums, England extracted profit from insurance. In 1855 the stamp tax on fire insurances amounted to £1,367,931 and in 1869 the diminished tax gave £1,018,654. (In June 1869 this tax was totally abolished). I would observe in addition that the longer periodicity of great earthquakes, storms, inundations and wars necessitates the accumulation for a number of years of the contributions put down for them. This accumulation could be used by the State at a low rate of interest, in place of public debts with a high rate of interest and thus cause a new reduction of the expenses of the state.

6.—In order to make insurance universal, the State must order it to be so; voluntary insurance requires an universal insight on the part of the population into the nature and utility of insurance; but this knowledge cannot exist here at present to such an extent as to stimulate the instinct of thrift and foresight. Even now, many towns, provinces and States possess a compulsory entrance to certain insurance offices. For instance, offices for compulsory insurance were founded:—

In Silesia	in 1742
„ Brunswick	„ 1750
„ Hanover	„ 1753
„ Norway	„ 1763
„ Wurtemberg	„ 1777
&c.,	&c.

The State must here also compel insurance by law.

7.—The State, even without insurance, feels itself bound to give assistance in cases of more than ordinary disasters. We have already mentioned the large donations given by the government to those whose houses were burned down in the Satsuma rebellion. According to Dr. Naumann, after great destructive earthquakes the Japanese Government in ancient times repeatedly remitted the taxes in the provinces which had suffered. This occurred in the years 818, 839 and 842. But not only the State, but also the public, felt it to be its duty to assist in alleviating the distress occasioned by great catastrophes. At the fire of Tokio in November 1877 *yen* 2,952,82 *sen*, were spent and each of the 39,490 sufferers received 9 *sen* 6 *rits*. How could a drop in the ocean like this be of any use? Thousands and thousands lose their all in the course of

every year, without any compensation; those who are well to do become beggars and are thrown from opulence into penury—unavoidable and unmitigated want and misery occur to thousands yearly. The State can confer the only benefit which will be sufficient for all—the benefit of legal universal insurance.

This would be followed by the prevention of impoverishment, the safety of house and other property and consequently also mortgages; cheaper credit, enhanced production and capacity for export;—and increase of the revenues of the State. All civilized nations have trodden the same path. For instance, in Germany at present the amount of property insured against fire is 15,000 millions of *yen*; in France it was more than this even in 1872; and in all other countries in a like proportion.

May it be granted to us to witness for Japan in a very few years a similar astounding development! Japan, the houses of which are threatened with more disasters than those of Europe, ought to find a stimulant in this very circumstance to increase the protection, and to advance, and lead the way in extending insurance against fire to a collective insurance against all dangers to which houses are subject.

NOTES AND QUERIES.

QUERIES.

Qy. 6. Can any of your readers inform me whether there are any, and if so, what books on Japanese surgery, or midwifery, as practised before the coming of the Dutch and Portuguese? (Unanswered.) Z.

Qy. 8. Mr. Bramson's interesting note on the relative values of coins in your issue of February 23th, leads me to think that he or some one else may possibly be good enough to clear up a few points which have frequently occurred to me:—

1.—Can any one say when, and under what circumstances, paper money was first issued in Japan? "Shosei" in your issue of March 9th gave a most interesting account of the *Han* paper money; and perhaps if there were a general issue before that, some other student may be able to do the same for it.

3.—Can any account be got of the regulations (if any) which governed coining under the feudal system? For instance, under what circumstances was permission granted to certain individuals to strike coins? This seems to have been done at various parts of the country, thus we have Musashi Ichibu, Suruga Koban, &c. (Unanswered.) X.

Qy. 9. I want information as to the locality of the signature of the original Treaty with Japan by Commodore Perry. Treaty Point, a mile or so away from the town indicates the spot: but was the treaty signed there in the Temple at Homoko, near which the butcheries now stand; or was it under a group of trees which stood on the site of the present British Consulate? I have heard both places assigned as the scene of the transaction. B. A.

Qy. 10. Can any of your medical or other readers inform me of the recent existence of cases of poisoning resulting from the use of bread made from impure wheat; the symptoms being those described in works on Medical Jurisprudence, as arising from the presence of the *Lolium temulentum* or Darnel grass (or other poisonous *gramineæ*) viz; Gastro intestinal derangement, narcotism, vertigo and convulsions. (Unanswered.) R. N.

Qy. 11. Many of your readers, when walking towards the new cemetery, must have remarked the *tombi*, about twelve in number, which dot the table land which lies above Ota on the one side, and the hill of Tobe on the other. These *tombi* are religiously preserved from the sowing of the farm, and must have some history: are they the burying-places of heroes fallen in some old quarrel? Can any of your readers enlighten me? (Unanswered.) T.

NOTE.

IN the *Japan Times* of the 30th March "N. or M." took exception to a statement made by me, viz: that *Oban* and *Koban* were for the first time coined in the period *Tenshō* (1573-1591) and he enumerated a number of coins which he asserted to have been coined prior to that period.

In reply I quoted the books from which I drew my knowledge, without at the time going into the details of the data given by "N. or M." A few days ago I had, however, occasion to make researches about the provincial coins of Japan, and the result I arrive at with regard to several of those enumerated by "N. or M." is so much at variance with his, that I cannot but conclude that he and I must have had access to different sources—or, what is more likely, that one of us has not quite understood the works we have had recourse to. As I am anxious to arrive at correct data, will "N. or M." kindly answer the following questions:—

Has he found it mentioned anywhere that the *Zenkō Koban* (which I understand emanated from the town *Zenkōji* in *Shinshū*) was coined by the *Ashikaga Shōguns*, or circulated under their rule?

Has "N. or M." found quite reliable authority for his statement that the numerous *Odawara Koban* were coined under the *Hōjō* Rule? Those acquainted with the history of Japan will know that by the *Hōjō* rule is meant the *Kamakura Hōjō*, who virtually ruled Japan from 1218 until 1333, when they were totally crushed. About a century and a half after their fall, a person by name *Hōjō Sōun*—but of no connection with the former family of the same name—took possession of the town of *Odawara* and he and his successors retained possession thereof until 1590. Of course "N. or M." knows all these rudiments of Japanese history, and cannot possibly have confounded the *Kamakura Hōjō* with the *Odawara Hōjō*; and that he cannot have meant the latter is obvious from the chronological order of his remarks, as well as from the fact that the *Odawara Hōjō* were still in possession of *Odawara* during *Tenshō*, so that any *Koban* issued by them need not have been coined prior to that period. I would therefore ask him to give me his authority for stating that the *Odawara Koban* were coined by the *Kamakura Hōjō*, at the same time explaining how they came to choose *Odawara* as the place of coining.

With regard to N. or M.'s statement, that the *Hidehira koban* was coined A. D. 745 by *Hidehira*, Duke of *Mutsu*,—is "N. or M." prepared to prove that gold was coined in that province as early as 745, that is four years before this metal was found, there, or in fact anywhere in Japan? Further, if it was *Hidehira* who in 745 coined the said *Koban*, can "N. or M." perhaps tell me, how old this duke was, when four centuries later he, in 1187, gave shelter in his castle to *Yoshitsune*, whose life was sought after by his brother, *Yoritomo*?

When "N. or M." has kindly answered the above questions I may have a few more to ask him.

WILLIAM BRAMSEN.

YOKOHAMA: SATURDAY, MAY 18, 1878.

NOTES OF THE WEEK.

FRIDAY EVENING, MAY 17TH.

THERE has been an unusual amount of activity amongst the shipping during the past week and there are more vessels on the berth than there have been for months past. The *Tibre*, with the *Marseilles* mail of March 24th, arrived in harbour on Saturday last, followed by the *Belyic* on the same day, twenty-one days out from San Francisco. The *Orissa*, with the English mail of March 29th arrived on the 13th inst. Of homeward mail steamers, the *Volga* left on the 15th inst., her mail being due in London July 8th, which will be anticipated by the mail per *Oceanic*, leaving here on Monday next, by a fortnight, in all probability. The coasting steamers have arrived and departed at their usual dates. We

notice that the *Orestes* a "blue funnel line" steamer, belonging to the Ocean Steam Ship Company, is advertised to leave shortly for London. This will be a capital chance for shipping home presents of curios with dispatch and safety, as there will be no transshipment of cargo between this and the London Docks, and her fragrant burden of tea necessitates the best use of her wings to fly swiftly homewards.

The *Orestes* arrived here on the 11th instant, after a quick passage from Hongkong of six days, against head winds the whole way, and we hear that the O. S. S. Company are likely to run a steamer at least once a month from Hongkong to Yokohama and hence to Shanghai, by the way of the Southern ports. It is also said that, in the event of the recommendations of the Indian Chambers of Commerce being carried out, respecting the mail contract, this Company is likely to prove a formidable competitor with the old P. & O. and that in the event of their tender being successful, they purpose building steamers of a high rate of speed, specially for mails and passengers, cargo being carried by the regular line.

Among the news from Europe which have had most interest for us, have been the details of the loss of the *Eurydice*. There seems no doubt that she was carrying too much sail, but it is being made clearer to our minds, as the enquiry and concurrent discussion go on, that her weights had been disarranged in such a way as to seriously impair her stability. Within sight of home, too, her sea stores were nearly exhausted; and it happened that the whole of her live weight, an unusually large crew, were on deck at the time when the squall struck her: so that a whole combination of circumstances were in favour of her capsizing as she did. An accident so terrible, so piteous, has not befallen the British Navy since the loss of the *Captain*; and this is even a more stunning blow, from Fate striking it at the time and place where it fell. In home waters, flying to her port past the smiling shores, the wooded chimes of England's fairest sea-garden, watched from the cliffs by mothers, sisters and still dearer ones of those on board, a thing of beauty, a triumph of constructive art, and carrying a precious freight of valour, discipline and skill, she rushes suddenly into a squall and is momentarily hidden from view by a soft white veil of snow. Momentarily? Alas, for the gallant hearts! those moments mean for them the duration of eternity! The squall passes, the sun shines out again and the cruel, deceitful waves dance as gaily, and sparkle as brightly, now that they are her tomb, as when—those few moments before—they formed her path. She has vanished—gone—the spectators strain their eyes in vain to seek her on the horizon, and wonder at the speed that has carried her so quickly out of sight,—and turn homewards. They heed not those two minute specks, barely visible on the water, little think that of the ship and the three hundred and twenty men on board—those two are all that remain of the *Eurydice*!

Advertisements in the local dailies announce that 'subscriptions in aid of the widows, orphans, and others who were dependent on those who were lost in her Majesty's ship *Eurydice* will be thankfully received by Mr. J. W. Lishman, Paymaster, R. N. at the Naval Yard.' No doubt the appeal will be liberally responded to. At first sight it may occur to some that—as she was a training ship, and as the bulk of her complement was composed of young men, many of them without relatives, certainly all unmarried—the disaster will not be so widely felt as would have been the case, had the accident happened to another vessel. But this is not the case. In addition to the 'boys' and younger seamen, the *Eurydice* had on board—as is usual with training ships when cruising, a proportionately large number—sixty or seventy at least—of picked, elderly, men to make up her complement;—steady men, almost all with families, and accustomed to save and remit regularly considerable share of their pay. But we need not linger over such details, nor seem to insinuate that the community of Yokohama requires special stimulus. Additional information can be easily got from more competent authority than ourselves; and we are glad to learn that over \$300 have been already received.

The one event of the week which has absorbed attention, both here and in the capital, has been the murder of H. E. Okubo Toshimitchi, which took place about half-past-eight on Tuesday morning the 14th inst. This was the day appointed for the distribution of decorations to officers of the Army and Navy who had been engaged in the suppression of the late rebellion, and the Ministers of State had of course, to be in attendance at the ceremony. Indeed, Ito and Okuma had a narrow escape of sharing the fate of Okubo, for just before leaving his house, he had sent messengers to them, requesting them to come as quickly as possible, and Ito's carriage was not a mile behind Okubo's, when the latter was attacked. There are two roads to the palace from the late Minister's residence, one of them, which he unfortunately took, being a very lonely and unfrequented one. The only persons visible at the moment were two young men in the dress of students,

who were apparently playing in the road, one chasing the other and affecting to strike at him with a branch of a flowering tree. Immediately that the carriage had passed, this man threw down the flowers and fired a pistol, at which signal three men, with the upper part of their dress removed, sprang out from the long grass which bordered the road, and from a little wooden shed. One, armed with a long sword, struck one of the horses on the foreleg, and, on its plunging forward, struck it again on the neck and brought it to the ground. The coachman cried for help and was on the point of descending from his box and attempting to escape, when he was cut down by a blow which divided his body from shoulder to waist. Another servant, a running footman, had meanwhile fled along the road shouting for aid. A fourth of the band, dressed as a policeman, (he had been dismissed, it appears, from the force, but had retained his uniform) meanwhile advanced to the carriage door and opened it, offering to protect the Minister. Okubo descended, and was immediately struck on the head by the man with the long sword. The two seeming students and the others, armed with dirks, then crowded round the fallen man and cut and stabbed him till life was extinct. He received two wounds on the head or face, one in the stomach, two on the right leg, and the fingers of one hand were cut by his attempting to grasp one of the blades. The assassins then threw down their weapons, resumed and adjusted their dresses, and quietly walked on to the palace gate, where they gave themselves into custody. Their names are given by an official Notification as Shimada, Sugimoto, Cho, Wakita and Sugimura, *shizoku* of Ishikawa *ken*, in Kashi (Kaga) and Asai, a *shizoku* of Shimane *ken*, near Kobé. They are all young men, the oldest being only 20, the youngest a boy of 18. From the palace they were taken to the central police station, whither they went laughing, and exulting in their success.

A very curious circumstance signalizes this murder. Not only did Okubo himself, two days before his death, receive an anonymous letter, telling him to be on his guard, as the writer meant to kill him, but when the *Choya Shinbun's* letter box was opened in the afternoon, a document was found headed 'The story of a traitor's punishment,' which had in all probability been put into the box before the murder. It gave the names of some of the assassins and stated their intention to kill him that day and their wish that their reasons for doing so should be published in all the papers. It proceeded to enumerate these as: 1°, That Okubo despised and oppressed the people and was despotic in his administration:—2°, that he was ambitious and greedy of wealth:—3°, that his expenditure on public works and public buildings was wasteful:—4°, that he was the cause of civil war and opposed patriots, and 5°, that he degraded the national dignity by his encouragement of and intercourse with foreigners. The *Choya Shinbun* immediately forwarded this to the police: but, for publishing it, the paper has been suspended. The document appears to have been genuine, as copies of it were found on the prisoners when they were searched; and we confess ourselves unable to see either the justice or the wisdom of stopping the *Choya*.

It is a significant and characteristic fact that public business was not allowed to be suspended in the least by the murder. The decorations were duly bestowed upon the officers; and Ito at once received the appointment of Minister of the Interior and discharged the duties of the office the very same day.

We have not space to comment to-day on the wonderful apparent carelessness which permitted so valuable a life to fall so easy a sacrifice. We shall take occasion next week to make a few suggestions on this head to the Government—to point out how such calamities may be guarded against in future: how murderers may be, at all events to some extent, deterred from similar crimes.

The murdered statesman was honoured by his Sovereign immediately creating him *Udaïjin*, the same posthumous honour which was paid to Kido, and a sum of 5,000 *yen* was sent to his family: he was further honoured by a public funeral, of which a friend sends us the following carefully minute account:

"Yesterday (11th instant) shortly after mid-day, the remains of Okubo Toshimitchi were committed to the tomb. During the forenoon his friends were admitted to the room in his house where the coffin was lying in state; and then, punctually at the time appointed, the procession left the house. At the foot of the hill leading to the Russian Legation, it was headed by a large body of troops.

"The ceremony was that of the Shinto religion. After the troops came priests, bearing branches of natural and artificial flowers. Then came the corpse of the coachman who was killed in his master's service—and here we may mention, that the body of the slaughtered horse was also buried near Okubo's grave. Then came the bier, preceded by *samurai*, bearing a white streamer inscribed with the name and rank of the deceased. The bier was in

the form of a large *norimon* of simple, new, white pine wood, but placed high up on the tops of the bearing beams, which rested on men's shoulders. Within this *norimon* was the coffin.

"Immediately after the bier, followed, as chief mourners, his sons, dressed in white: then followed, in carriages, the Princes of the Blood, the high officers of state, and the members of the Foreign Diplomatic corps. Some idea may be formed of the length of this procession, when we state that two hours elapsed before the cemetery was reached, and that the line of carriages, troops, &c. extended for the whole distance of a mile-and-a-half from the house of the deceased to the place of his sepulture.

"The streets were thronged by the populace, with here and there detachments of military students to keep the line. On reaching the cemetery, the coffin was placed under a shed which had been temporarily erected near the grave. On one side seats were prepared for the more distinguished guests: on the other for the relatives and friends of the deceased.

"On separate lacquered trays were then placed before the bier by the priests offerings of fresh vegetables, fish, rice &c. symbolizing greetings to the spirit of the deceased. When this had been done, with much obeisance and prayer, the High Priest read from a paper the titles and services of the dead statesman. Then sprigs of the *sasaki* flower were offered to the spirit. First, his near relatives advanced separately to the front of the bier, made obeisance and laid their twigs on a tray placed precisely in its centre. The Imperial Princes and then the officers of State followed. This part of the ceremony occupied about a couple of hours. The priests then again offered up prayers and removed the food offerings, and the foreign visitors were then informed that the ceremony was completed. After taking leave of the Princes, &c. they and all but the relatives and a few intimate friends, left—none but near connections of the dead being allowed to be present when the body is actually lowered into the grave."

Our space has been so taken up by the record of these sad events—and, we confess, our spirits so influenced by them—that we have neither room nor inclination, this week, to touch on lighter topics. Mr. Dave Carson, that well-known and clever public favourite, will, we are sure, forgive us for postponing till next week, criticism of his most amusing entertainment. 'Entertainment' one truly gets for one's money, for Mr. Carson never opens his mouth but he makes us laugh: and his witticisms, and particularly his local hits and allusions, are all so good-humoured and in such good taste, that a very prude can find nothing in them at which to be offended. When we compare his jesting to our own Punch's cartoons, and say that it exhibits the same talent, humour, tact and good feeling, we say none too much, and somewhat too little.

We are sorry to have noticed, by the way, in the *Daily Advertiser*, a quite uncalled-for rebuke to an allusion made last Thursday night to Okubo's murder. Our contemporary's reporter either mis-heard or misunderstood it: his remark conveys an entirely unfair and incorrect impression, and we trust we shall not see the criticism reprinted in the more widely circulated *Japan Mail*. We are glad to note that Mr. Carson will give us four performances next week, which will give us an opportunity of noticing the performances of his company in detail.

Quite a large quantity of matter has to be kept out of this Review this week by the mechanical exigencies of a mail-day falling on a Saturday. A 24 page paper will be given next week. \$3,500,000 of the New Loan has been already taken up.

THE TIMES OF TAIKO.
(FROM THE JAPANESE.)
BY F. BRINKLEY, CAPT. R. A.
ISHIKAWA GOYEMON.
Chapter XX. THE END.

FROM the outer margin of the eight thousand and eight valleys chosen by Kôbo Daishi as the site of the Kôya cloisters, the central sanctum was reached by the passage of three gates, each some two miles apart, and each affording ingress to a space more segregated than that without from the relations and liabilities of life. The first stood ever open, offering no obstruction to the feet of any pilgrim, but the second could only be entered by those who, receiving complete absolution for their sins and utterly renouncing the world, abandoned all its pomps and vanities beyond the threshold, while the third admitted none but the cenobites themselves, or such others as, by years of fasting and prayer, had proved themselves worthy to approach the holiest of the holy fanes. Once within the second gate, the weight of crime, however heavy, fell off, and the terror of punishment, however deserved, was dissipated; for the laws of man were abrogated by the mercy of the gods, and no power short of the Emperor's direct com-

mand could violate the sanctuary. Here then, under ordinary conditions, Hidetsugu might be safe, even though the guardians of his asylum did not petition for his pardon, but with such an enemy as Taiko, was security to be found anywhere within the four seas? Imperious, passionate, and never stopping short of complete achievement, what war-rantriness was there that he might not set aside even the sacred privileges of the cloister, and prefer the sin of sacrilege to the imputation of repulse? Perhaps this was what the priests feared when they proposed to intercede; certainly this was what Hidetsugu hoped when he refused to accept their intercession.

At daylight then, on the morning after the noble refugee's arrival, the abbot and fifty of the oldest cenobites assembled in the principal temple of the outer enclosure. The rays of the rising sun, struggling in through a forest of cedars, lit up here and there the altars of embossed lacquer and the tall silver vases that stood on either side, supporting immense clusters of golden lotus flowers, but through the thick duskiness brooding overhead, a few feeble tapers scarcely illumined the flowing robes and graceful outlines of the queens of heaven depicted on the ceiling. The incense smoke of ages encrusted the massive gilt pillars and the richly ornamented votive tablets that adorned the walls and niches of the huge aisle, which now resounded with the cadence of innumerable deep-toned drums and mellow bells, rising at regular intervals to an impetuous, crashing climax, and then sinking again through a series of ever-fainting, ever-separating strokes to a vibration gentler than its own echo.

On the Dais of Exhortation, flanked by ten priests, each bearing a bronze cymbal, knelt the abbot with his face to the altar, while behind him Hidetsugu and his five followers, with clasped hands and bowed heads, awaited the consummation of the rites that would qualify them for admission to the inviolable sanctuary.

When the seventh cadence of the drums and bells had passed almost imperceptibly into silence, the ten priests struck their cymbals three times, and then, led by the solemn voice of the old abbot, recited the scripture of the forty-eight precepts in a deep, never-changing monotone, that seemed to linger among the recesses of the temple long after the notes of the chaunters had ceased. Then the abbot, having laid aside his rosary, proceeded to shave Hidetsugu's head, and five of the priests that had knelt on either side, performed each a similar office for the Earl of Awazaki, Bansaku and the three pages.

This ceremony marked the segregation of the novice from the carnal world. It was followed by a decade of prayers, at the conclusion of which the abbot invested Hidetsugu with the sacred ephod.*

At the moment of investiture, the whole fifty priests united their voices in a solemn incantation, and just as the end of the band was inserted in the jade ring, the drums and bells renewed their cadence, welcoming the admission of another heart to the mysteries of the sinless life.

Thus, amid clouds of incense and voices of orison, the six men, not wholly free from a sad consciousness of death in life, passed through the gate of sanctuary into the seclusion and security of the second cloister. Here the deer browsed and the pheasants roosted in the very gardens of the temples, while the white egret fished undisturbed in the stream that rippled by the avenue's margin, for even the timidity of bird and beast slept in the shadows of peace that from century to century had deepened over the eight thousand valleys of Koya.

The temple assigned to the Minister and his followers stood on a plateau overlooking a series of cascades, from which a constant breath of freshness and murmur of tranquillity ascended to the glades of the pine forest above. Under a league of overhanging bough and toppling cliff, the white water tumbled and foamed over lofty ledges and round strangely shaped rocks, or crept in and out of vaulted grottoes where the ouzel built and the king-fisher watched,

* The ephod was of crimson brocade, ornamented with four plaits and seven loops—the former representing the pillars of doctrine, while of the latter, the central one typified Shaka, and the six others his disciples, Kasho and Anan, as well as the goals of government, life, increase and omniscience. One end of the band for suspending the ephod from the neck was permanently attached, but the other was free, so that at the moment of investiture it might be passed through a jade ring fastened to the upper corner on the left. This ring was symbolical of the human heart, while the whole ephod represented the pure, passionless life inculcated by the doctrines of Buddha.

F. B.

or sometimes dividing into a net-work of babbling rivulets, wandered at hazard through wilderness of immense boulders and many-coloured pebbles. Thus amid all the restful isolation of these endless valleys, there was no sense of either sad silence or melancholy loneliness, for whether throbbing in the breeze of evening, or echoing full and sonorous in the calm of sunrise, the pulses of the cataract sounded always like the beating of a mighty heart, and the rippling of the stream like the laughter of a happy spirit. It was indeed a region well fitted to invite comfortable repose or mature dreamy philosophy, but withal much too lovely either to be itself forgotten or to suffer memories of kindred beauties to sleep.

And so Hidetsugu and his followers learned, when a few days of tranquillity had somewhat lulled their sense of instant peril. It was hard to look beyond so much that was fair in the present and contemplate only a hereafter of apathy and oblivion; hard when the silence was stirred by mellow notes of vesper bells or plaintive chaunts of returning pilgrims, not to follow their echoes in fancy, as they rolled up the ravines and out over the mountain tops, towards homes where love awaited reunions that could never more take place; and hardest of all, after the long watches of the night had been haunted by phantoms of departed pleasures and broken hopes, to recommence in the grey morning a never varying routine of penance and of prayer.

Ten days had passed since the admission of the exiles to the sanctuary, and as yet no communication of any sort had reached them from the outer world. It was no longer possible to doubt that the Regent awaited a pretext to be merciful. Often of late had this conviction forced itself upon Hidetsugu, accompanied also by another reflection: he remembered that men, misconstruing his silence, might accuse him of seeking sanctuary and neglecting justification. At last therefore, he resolved to adopt his followers' counsels and accept the cenobites' intercession. But was there still time to employ that intercession, or had the limit of long-suffering been reached?

It was the evening of the tenth day. Hidetsugu sat by the open verandah, watching the breath of the river creep soft and snow-like above the pine-tops. The valley was still in shade and darkness, for the moon had not climbed to the mountain summits, but far away in the west, a tender light brooded like a reflection of by-gone happiness, and between the opening of two wooded peaks, an illimitable ocean of silver seemed to roll its lustrous waves even to the sources of the placid star-light.

Often in seasons of sickening suspense, when every token by which the truth might be deciphered is inaccessible, and hope has lost strength to exorcise the vague phantoms of imagination, many a trifle, disregarded in the health of reason—the shadow of a passing cloud, the moaning of the sea, the fall of a flower, or, it may be, the song of a distant bird—seems fraught with a strange significance, and lays the mind under the influence of a spell hard to be broken or cast off. It may be that even as sometimes, on the verge of the grave, the current of accumulated years sweeps away the superstructure of learning and experience, and drifts us back to the simplicity and guilelessness of early childhood, so perhaps the weight of pain and sorrow, wearying the wings of ambition and assurance, draws us at the last down to the bosom of nature into closer and closer communion with the things that shall presently be the companions of our eternal sleep, until finally their language becomes intelligible to us, and we read in their phases the story of our destinies.

Thus it seemed to Hidetsugu that the past and future of his own life were truly depicted in that sky of summer twilight, for the dim refulgence fading eastward into dusk and distance, represented the glory and gladness that had once illumined his days, while the horror of approaching fate found its type in an immensity of blackness that raised itself slowly from the southern horizon with lurid depths and mantling wreaths, like the smoke of a burning world. Not his heart only, but all nature, seemed to be oppressed by a sense of approaching catastrophe. The voice of the river lost its laughter and lapsed into a long tremulous moan; the air was loaded with stillness, and such a languor was abroad that the dove ceased to coo and the cicada to drone, while the lizard paused in the moss by the cedar roots and the toad sat motionless and expectant under the fern arches: no sound, no motion, save once the boom of a passing beetle and some-

times the fall of a Mimosa petal into the foaming stream below. The dying summer listened fearfully for the foot-fall of the hurricane that was coming to clothe it in the russet pall of autumn, and carry it to its grave among scattered blossoms and prematurely withered leaves.

Suddenly, while Hidetsugu watched, the noise of the cataract was hushed, and the pine trees on the hill side trembled and waved their arms as though in terrified supplication. Another moment and the voice of the storm would break the silence. He turned, and raising his hands, was on the point of summoning the pages from the ante-room, when the door opening, disclosed Bansaku kneeling on the threshold. The dim light of a solitary taper was yet sufficient to reveal the pallor of the Comptroller's face and the despairing trouble of his look, little like the aspect with which he had escorted his master from the oratory two hours before.

This evident distress elicited a momentary response from Hidetsugu's heart, but almost immediately mastering his emotion, he beckoned Bansaku in, and anticipating the main part of his intelligence, asked briefly :—

"Who has come, Bansaku?"

"The Earls of Gifu and Iyo, and the Inquisitor, Fukuhara."

"With what following?"

"Ten thousand cavalry, your Excellency."

Even as the comptroller spoke, the first blast of the hurricane came rushing up the gorge and dashed itself wildly among the woods and against the temples. Hidetsugu turned with a shudder, and saw that the stillness of the valley had been changed into a clashing of boughs and a quivering of foliage, and that troops of dusky clouds, swooping down like demons of destruction, were chasing each other along the hill tops and leaping with giddy speed from cliff to cliff. The air too was filled with strange sounds—the hoarse muttering of the storm, the crash of snapping branches, the sighing of torn grasses and the rustle of whirling leaves—but over and above all he seemed to hear a ring of innumerable bridles and the hum of a passing multitude. The sanctity of these cloisters, he thought bitterly, guarantees them as little against the fury of the hurricane as their asylum guards me from the Regent's implacability.

"Have the Earls announced their intention of seeking me here," he asked, "or is our meeting to take place without?"

Bansaku looked wonderingly at his master, but made no attempt to reply until Hidetsugu repeated his question. He then answered :—"Your Excellency surely knows that it is impossible for the Earls to penetrate the precincts of the second cloister. They can but await your pleasure without, and your Excellency does not think, I presume, of abandoning this asylum and deliberately placing yourself in your enemies' power."

Hidetsugu laughed ironically. "Think you, Bansaku," he said, "that ten thousand cavalry have come like pilgrims to do homage to an effete monastic privilege; or that I will forfeit the respect of brave men by exposing these helpless priests to the ruin resistance would inevitably involve? No! Bansaku. This sanctuary may be able to protect a common criminal against his executioner, but it is powerless to avert Taiko's vengeance from the man he believes his rival. I will go to meet the Regent's messengers. Whatever their errand be, it cannot add to my humiliation, since that is already complete, nor disappoint my hopes, since they have now ceased to exist."

Bansaku made no attempt to dispute this resolution. Perhaps weary of waiting, he welcomed anything that limited suspense; perhaps his brave heart revolted at the idea of hiding in a temple, while an enemy clamoured at the gates.

Brief as were the refugees' preparations for departure, they had scarcely been completed, before many hundred priests assembled to escort their guests to the gate of sanctuary. The old abbot himself was there, endeavouring by promises of remonstrance and, if need be, of resistance, to calm the cenobites' indignation at this violation of their ancient privileges, and when Hidetsugu passed to the vestibule, the glare of a hundred torches illumined a sea of faces agitated by a storm of wrath and sympathy.

Observing that Bansaku carried a parcel wrapped in crimson silk and carefully secured, Hidetsugu enquired what it was. The comptroller, without replying, knelt down, and removing the silk wrapper, displayed three dirks, richly mounted and bearing on their lacquered sheaths the prime Minister's arms. Hidetsugu, recognizing gifts made by himself in happier days to the comptroller

and two favourite pages—gifts little destined for such an end as they were now about to serve—turned away with a trembling lip, and had well nigh suffered his anguish to overcome him, but Bansaku, laughing merrily, remade his parcel, and said as he placed it in the palanquin :—"precious gifts these, that enable us to join your Excellency's journey beyond the reach of slander and injustice."

No other words were spoken. The six men set out in silence to traverse the distance that in all probability measured their course to the grave. Converse indeed, even had it been desired, would have been impossible, for the mad hurricane made sport of every sound save its own din. Now, like some savage monster, it seized and worried the tall cedars, roaring and raving all the while as though delirious with anger; anon, like a malignant demon, it swept shrieking up the glen and dashed through the mountain passes with a howl of impotent frenzy; at one moment it hurled an avalanche of sand, shingle and twigs against the staggering travellers; the next, it gathered the foam of a waterfall and dashed it in their faces like a shower of snow-flakes, while from time to time a blaze of lightning displayed the cloud-piled sky and reeling woods, or shone upon some belated bird struggling vainly to recover its accustomed perch.

It was nearly midnight when the Minister and his followers reached the principal temple of the outer enclosure. The gates stood open, and the court-yard was full of horses, halted wherever fence or gable afforded seeming shelter from the storm, while crowds of armed men occupied the out-houses and refectories, or cowered under the thatched eaves. The Earls of Gifu and Iyo, accompanied by a score of inferior officers, kneeled in the vestibule to receive the Minister, but Hidetsugu, scarcely noticing their obeisance, passed proudly to the chamber he had occupied on the night of his arrival.

There by his directions a temporary dais was contrived and a silk curtain hung before it. For the rest, the construction of the room readily admitted certain details of arrangement sufficiently assimilating the disposition of an audience chamber.

This empty semblance of state might well have been neglected at such a time, especially in the case of one whose relations with the outer world had been virtually severed by the ceremony of consecration, but an unreasoning attachment to the forms and fashions of old habit is one of the evidences that most sadly attest prostration in the hour of our mortal extremity.

These preparations completed, the envoys were admitted: Fukushima Earl of Gifu, Ikeda Earl of Iyo, and the Inquisitor Fukuhara. The three men, kneeling on the right and left at some distance from the dais, bowed their heads but remained speechless, for seeing his former friend and ruler unable to command even the shadow of his late power and magnificence, and knowing the terrible sentence he was himself charged to execute, Fukushima could only struggle to restrain his tears, and his colleagues, little less affected, did not dare to anticipate their leader.

"I understand you, Fukushima," said Hidetsugu at last. "Your message is one that can be conveyed without words, and its object might have been achieved without the aid of an army. Ten thousand men are hardly necessary to overcome my reluctance to die."

"I have the Regent's orders to assist at your Excellency's suicide," answered the Earl in a low unwilling voice, and still preserving his attitude of obeisance.

"Were you chosen on account of your youth or in deference to your love of novelty?" enquired Hidetsugu sneeringly. "Have fortune and my followers, think you, so completely cast me off, that I cannot at the last command a hand to place me in the road to Hades?" Then passing suddenly from raillery to passion, he seized a long sword that lay beside him, and flashing it from its scabbard, held it pointed towards the Earl. "Here," he cried, "is the friend that shall serve me in this extremity, neither will an arm to wield it truly be wanting. The head of the Prime Minister shall not fall under the unproved weapon of a boy."

As he spoke, his blood-shot eye and choking utterance betrayed a fury on the verge of vanquishing control. The envoys, without daring to reply, carried their trembling hands to the hilts of their dirks, and at the same moment the hurricane, as though it recognized a kindred spirit in this paroxysm of rage, threw its strong arms about the temple, and rocked the huge building backwards and forwards with a tumult of savage delight.

Hidetsugu retained this position of menace for a moment,

but only a moment; for as the wind that, even while it tosses the branches of the mountain cherries, bends their blossoms within reach, so the fierce despair that drove his thoughts upon violence and the crash of combat, summoned also a heart-stirring memory of the things he was about to leave behind. He thought of Chika, of his children, of those he had loved, carelessly in his prosperity, wildly in his adversity; thought of the many faithful vassals and friends whose fate in a great measure depended on the fashion of his own death, and so, yielding at last to a nobler impulse, silently sheathed his sword, and assumed his old air of proud indifference.

Then in a gentle but firm voice, he addressed the envoys:—

"Attend well, I pray you," he said, "to these my last words, and let the memory of what I have once been persuade you to interpret them faithfully hereafter. I have not prolonged my life till now with any hope of respite, nor yet because I set much store by it, but simply because my innocence might have been attained by a precipitate suicide. I have now the Regent's orders to die, and I obey them, praying only that he may never be so unhappy as to discover their injustice. Even the statements of our foes merit credence when the proximity of the grave renders deception unprofitable. Tell the Regent my father then, that I, within sight of my tomb and glad to give him this last proof of my loyalty, stake the repose of my soul on the blamelessness of those that have loved me and served me here. Let my fate satisfy my enemies, and do you, if you value the blessing of a dying man, join your supplications to mine, that the darkness into which I am now passing may at least be lightened by the knowledge of my vassals' undisturbed happiness."

With these words, Hidetsugu rose and left the room, attended by his five followers. The envoys also, not a little moved by what they had heard, were presently about to withdraw, when their exit was barred by a multitude of priests, who at a sign from the abbot flocked in from either side,—completely filling the chamber and its approaches. The old abbot then prostrated himself before the Earl of Gifu, and in words rendered almost unintelligible by emotion, conjured him to refrain from violating a sanctuary where for seven hundred years no deed of blood had ever been perpetrated. Hidetsugu, he said, was no longer amenable to human laws; he had abandoned the world, and entered an asylum where only the hands of the gods could reach him, and though as a soldier he scorned to ask for mercy, yet was he none the less protected by the sacred tutelage of the saint Kobo Daishi. In the name, therefore, of the seven thousand cenobites of Koya, the abbot prayed the Earls to take no further steps in the matter until they had submitted these considerations to the Regent, adding that the rejection of their suit would signify nothing less than the dis-establishment of the Koya Cloisters.

The Earl, before replying, rose, made his way through the priests, and carrying his sword from its place beyond the threshold, laid it at the abbot's side. "Father," he said, "your remonstrance is just, but were I to convey it to the Regent, or delay till you had done so, I should inevitably be accounted the Minister's accomplice. I prefer death to such an imputation. If then you are determined to oppose Taiko's orders, kill me first and proceed afterwards at your leisure."

So saying, he respectfully presented the hilt of his sword to the abbot, but the old man pushing it away, turned and gazed appealingly at the other envoys, hoping to detect some token, however feeble, of pity or vacillation. But there was none. The Minister's fate was sealed, and the sanctuary of Koya doomed to be dishonoured.

Hidetsugu passed the remainder of the night alone, seeking vainly to solve that problem over which so many a heart has broken and will yet break,—how to say farewell. Life is but a sum of separations, and yet we never learn to part. The streaming eye, the close embrace, the yearning gaze, the waving hand; few though the forms be and easily rehearsed, no man has ever yet so fulfilled them as not to be overtaken by the end, before he knew that he had reached the beginning. Time is not long enough to achieve, speech not large enough to define, and love not cold enough to conceive the act that we call "taking leave." It is done we know not how, concluded but never completed, and is nevertheless that with which humanity could least afford to dispense; for much as it may seem at the moment to sharpen pain and multiply tears, without it the possibility of resignation were inadmissible. Not indeed that it induces fortitude, nor yet because its outcome is often a precious reminiscence destined afterwards to often sorrow and survive even the hope of reunion, but be-

cause to see once more before parting, and to speak with once again before separation, are the two ideal solaces for which affection utterly refuses to accept any substitutes. Alas, and again alas, for him who in his last hours finds himself irremediably debarred from such consolations, and unaided by any present sympathy to escape from that which alone makes parting painful,—memory! And if to the desolate misery of such a time; if to its endless repetition of pictures that grow more vivid, more frequent and more exquisitely pathetic, as the moments for contemplating them become shorter; if to the anguished yearning that struggles to fix and hold commune with images of fond faces and ancient kindnesses, which like the shadows of clouds in a gliding stream, are reflected in the depths and effaced by the flow of our tears; if to all this be added the bitter consciousness of an unjust doom, the knowledge that many of our friends will be involved in our ruin, and the certainty that those we have most loved will be constrained to accept the caresses of our cruellest enemies, truly the sum might well suffice to crush a stouter heart than Hidetsugu's.

At daylight he summoned his five followers to his presence. The storm was hushed, and the feverish atmosphere had been cooled by a deluge of soft rain that still dripped from the soft tendrils of the wild vine and glistened in the scarlet cups of the cockscomb. Earth, wood and stream exhaled breath of gratitude inexpressibly fresh and fragrant, and all around, the birds poured forth an ecstasy of happy song. Alas! alas! how to close the eyes for ever on so much that was fair, how to part bravely from so much that wooed delicious sojourn?

The six men were dressed entirely in white and carried neither sword nor dirk. For the rest, with the exception of a pallor more or less marked, and a certain unnatural deliberation of speech and movement, no evidence of their purpose was apparent.

Bansaku advancing, silently placed the three dirks before the Minister and then retired to his place. Hidetsugu, taking two others from the alcove behind him, added them to the number, whereupon his five followers exchanged looks of perplexity and astonishment.

"Risseido," said the Minister, addressing the youngest of the pages, a lad of some seventeen summers, "you are too young to die. You have well fulfilled all the duty that loyalty required of you. Return now to Kiyoto, and let it hereafter be your care sometimes to burn incense at our graves."

But at these words the boy, who to the quiet resolution of his companions, had hitherto added a laughing indifference that seemed inseparable from his merry face, bowed his head and burst into a flood of tears. "Will your Excellency," he sobbed, "deprive me at the last moment of a privilege which, though little merited, is now the sole object of my hope and desire. Hands worthier than those of one for ever disgraced if he survive, will not be wanting to tend your Excellency's grave, nor will your memory lack a shrine in hearts unaffected by the shame and sorrow that would be my inseparable companions. Do not say that I am too young to die, since I am old enough to be dishonoured."

Hidetsugu, too much moved to reply, added a sixth dirk to the number of those lying beside him, and presently made a sign to Bansaku, who thereupon threw open the door of the antechamber where the abbot and the three envoys were seated.

Six lacquer trays were now brought in, and on each of them Hidetsugu with his own hands placed a dirk and a roll of paper. This done he turned to his followers and addressed them thus:—"My friends, chance and your own unequalled devotion have willed that you alone of all my vassals should accompany me to my last resting place. If it be true that the seeds sown here blossom in the life beyond the grave, surely the flower of my gratitude will bloom about your feet hereafter. Time might have dealt more kindly by us, seeing that we pass from its very threshold into eternity, but I at least make no complaint, since I am saved the pain of parting from you my most faithful, most loved followers. And now, since to linger would only make life dearer, let us hasten to achieve the destiny that fate has willed for us. I would fain have preceded you all to the grave, but I remember that when I am no longer here, you may not find leisure to die peacefully. Sasabe therefore will perform the last office of friendship for me, when I shall have done the same for you."

So saying he handed a tray to Bansaku and each of the three pages, who receiving them with an obeisance, descended calmly into the garden, and seated themselves among the

scattered leaves and bruised blossoms that the storm had cast down before the verandah.

They then, having first bared their bodies to the waist, raised the dirks for a moment reverentially to their foreheads, and afterwards unsheathing them, wrapped the blades in paper to within three or four inches of the points. The envoys meanwhile watched all these preparations with real or assumed indifference, but the old abbot hid his face and sobbed aloud.

Hidetsugu now took his sword and moved towards the verandah. Risseido sat on the extreme right of the four men. He had recovered all his gay unconcern, and when he heard his master's foot-fall on the steps that led to the garden, he turned and said with a laugh:—"We shall await your Excellency on the banks of the Sandzugawa."*

Bansaku, hearing these words, carried his dirk forward by way of signal, and his three companions imitated his motion.

But at that moment the earliest breeze of morning, parting the cedar boughs, came and laid its soft fingers on the doomed men's brows, at the same time breathing into their ears a peaceful sound of plashing water and the plaintive cooing of a ring-dove. For an instant they paused involuntarily, and gathering a deep breath of this fragrant air, exhaled it in a long sigh of exquisite regret. It seemed as though nature, moved to pity by their patient suffering, had uttered and sought this last expression of farewell.

"*Namu Amida Butsu*" said the comptroller, and almost simultaneously the four men, plunging the dirks into their left sides under the ribs, forced them slowly round to the right. Hidetsugu raising his long sword, with unerring blows severed the necks of the three pages, one after another, but when he came to Bansaku, the comptroller turning, raised his bloody hand and whispered:—"Thank heaven that we have been allowed to die before we had time to be traitors."

Up to the moment that Bansaku's head fell, Hidetsugu had betrayed no symptom of emotion, but as he turned to ascend the steps of the verandah his strength seemed suddenly to forsake him, so that he staggered like a drunken man. Recovering himself however by a supreme effort, he reached his former seat, and facing to the west, prepared himself hastily for the end.

"*Sasabe*," he said, as he handed his blood-stained sword to the Earl, "I will thank you when we meet on the road to the land of Shadows. Let us hasten to join those that are now waiting for us there."

The next moment his head fell, and the Earl, kneeling for an instant with deep reverence beside his master's body, stabbed himself twice in the breast and throat and followed his companions to the Life of Rest.

On the night of the third day after the above events, a man passed up the avenue that led to the castle of the Baron of Sawayama. His features were concealed by a hood, and he carried in his hand what appeared to be a roughly folded bundle of white silk. This, on arriving at the gate, he placed under his arm, hiding it carefully at the same time with his long sleeve, and then, drawing his hood partially back, revealed to the astonished guards a face which though ghastly pale and haggard, they recognized as that of their master, Ishida Mitsunari.

He entered the castle without a word, and shut himself into one of the most remote chambers. There, having deposited his bundle in the alcove, he threw himself on the ground, and remained for a long, long time, now writhing as though in physical agony, now tossing himself about spasmodically as though a fever burned in his brain.

At last he rose, and with trembling fingers began to untie the bundle. The process was a slow one, for each ply unrolled seemed to inspire more and more horror and reluctance, and often, drawing back his hand, before it had even touched the silk, he paused for several moments with averted gaze and suspended breath.

What tale of horror is this lying hid in the blood-stained folds of the silk? The head of a girl, beautiful as a poet's fairest fancy, her half-closed eyes still seeming to look—but oh! with what a glassy coldness—through a fringe of lashes among which a tear is still entangled, and her long black hair clinging closely about the ghastly wound that encircles her snow-white throat.

Oh! Chika, lovely, loving Chika, come to death by the wiles of the miserable man that now, from darkness to dawn, knells spell-bound before your mutilated head, would to God

* The River Styx.

that you had power to change into reality the semblance of apathy that dwells in his stony gaze and rigid features, for much as you have suffered, you were too gentle not to pity so terrible a punishment as Ishida Mitsunari is doomed to endure for your sake. Never more for him will the calm of a summer morning be untroubled by exhaustless tears, nor the watches of a winter's night be unpeopled by pitiless remorse; never for him will the whisper of a hidden anguish cease to echo in the cadence of the breeze, nor the discord of a broken heart rest from marring the music of life; for only gnawing misery will be his companion through all the hollow pageant of his gilded days, until the evening when men shall find his headless body on the battle field of Osaka, and in his bosom a tress of black hair wrapped in the death song of his murdered love:—*

"The Snow-shroud drifts from the blue,
"The dead leaf drops from the tree,
"But the blight and the bloom shall never be two,
"Nor the spring come back for me."

THE END.

* Hidetsugu's children—two boys and three girls—and his thirty-four wives and concubines, were all beheaded by Taiko's orders, and the Palace of Pleasure razed to the ground.

THE SONG OF THE MILL.

When summer airs are fresh and sweet,
And clover blossoms new,
And birds rejoice, and young lambs bleat;
And skies are clear and blue.
How merrily the mill goes round:
How merrily goes the mill,
As the hopper clacks with a cheery sound,
And echoes o'er the hill!

When age sits shivering by the fire,
And wintry wolds are white,
And youth doth chill his warm desire,
And frosty earth-winds bite:
Still merrily the mill goes round:
And merrily goes the mill,
As the hopper clacks with a cheery sound,
When all the world is still.

We know no strife that plagues the great;
No care that kills the small:
We live above the reach of fate,
And therefore fear no fall,
So merrily the mill goes round:
So merrily goes the mill,
As the hopper clacks with a cheery sound,
And rings across the hill.

YOKOHAMA MARKET REPORT.

FRIDAY EVENING, MAY 17th, 1878.

IMPORTS:—The holiday of the Spring Race week rendered unnecessary in last number any report upon a market in which nothing was doing. We have now a fortnight's operations to review.

Our lists of quotations show a decline in value of both Yarns and Shirtings, from heavy arrivals of goods—of those contracted for, of course,—of others unsold in advance, attracted to the market as a consequence of the report of sudden demand and large sales to arrive. Stocks are consequently very heavy, and native merchants are playing, apparently with fair prospect of success, the same game which they have played on more than one previous occasion. Having induced the import of the goods by their sudden and large demand some months ago, without being required to deposit security in the shape of bargain money, they now, almost unanimously, throw up their old contracts and offer lower and lower prices, though the course of native exchange has been in favour of honesty. Some few houses are meeting them, but importers that are able to hold prefer to decline selling. It is much to be regretted that Japanese law gives the foreign merchant who has not provided himself with the security of bargain money, no redress against these breaches of contract. If combination among foreigners were possible,—instead of competition to quit goods at gradually declining and ultimately disastrous rates, things would soon right themselves, and the stocks would be cleared off at original contract prices, which show a fair profit: for there is no doubt now that there is a large legitimate demand in the interior for Yarns. Even the display for a short time of such determination among foreign merchants would suffice to break down the present combination of the native brokers; but as we can see no prospect of this taking place, we are forced to fall back on our quotations, and report the outlook of the market as gloomy.

In all other foreign goods, the business done is on the most limited scale with nominal prices as per our quotations. Exceptions to the general depression are KEROSENE OIL, which, being in few hands is firmly held at slightly better figures, and FORMOSAN SUGAR, which maintains its position and is resolutely held for higher rates.

EXPORTS:—SILK. The news from Europe being considered a little more pacific, buyers have shown somewhat more inclination to operate in this market. But very little business has been actually done, the exhaustion of stocks and very mixed character of the last dregs of the season's produce preventing orders being filled. The same silk goes in and out, from one inspecting godown to another, and only about 170 shipping bales have been actually settled.

Prices are slightly higher, nominally, but with the small business doing it is difficult to give quotations of a fully reliable nature for all sorts: we confine ourselves to such as represent actual business done in a few sorts. They will be found in their usual place.

Stock in Yokohama we estimate at about 800 Japanese bales. Total Export to date is 21,147 bales against 20,432 bales, at the same period last season. It must borne in mind by our readers abroad that, bales having been made up heavier this year, the 700 odd bales of excess does not fully represent the difference between the exports of the two seasons.

THE NEW CROP.—We are happy to say that there is every prospect of a good and plentiful crop.

Though in the Shinshiu districts, cold weather and a late Spring have kept back the worms somewhat, and in Joshiu and Mibashi they are not very far advanced, in some other districts,—for instance, in the neighbourhood of Atami, they are so well on that in ten days or so they may be expected to begin to spin. Rather more rain than has been desirable has fallen, but fortunately there has been no hail, and though a certain amount of damage has been done to the mulberry leaves in some parts by caterpillars, these have promptly been destroyed and a good supply of food for the silkworms may be considered as secured. It is to be hoped that the valuable recommendations of Herr Greeven will be attended to regarding protection against the Uji. New silk in small parcels may be looked for in about six weeks.

TEA:—We have not thought it of any use, until to-day, to make any but cursory mention of this market. We are now in a position to write with more certainty and fuller information. Since the opening of the season about 11,700 piculs of the new crop have been settled, besides a few small parcels bought before the 1st of May, by purchasers whose operations have said more for their means than their judgment. The quality is on an average better than that of last season at the same period, and the scale of prices very decidedly lower, native merchants having by experience found out the futility of over-holding First Crop Teas.

BLACK TEA:—Several samples of this have been shown, and have found buyers at \$28 to \$32 per picul. The appearance of the leaf hardly warrants such high rates, while its quality in the cup is ill suited to the London market. A few small fancy parcels may find buyers at prices which will bring exporters out, but the bulk, we should think, would barely fetch 1s. 0d. per lb. and we should consider it bad property to hold long in warehouse. As only a few small parcels have as yet come in, we are hardly prepared to give quotations or to give a more decided opinion. At the close of the month we shall be in a position to do so.

Native merchants assert that producers up-country are so dissatisfied with the prices realized by the first crop, that they purpose converting the whole second crop into Blacks. Should they do so, we believe they will find that their experiment will have a most unsatisfactory result.

EXCHANGE:—There has been a fair business done during the week. Private paper on London has been sold to some extent at rates varying from 4s. 0½d. to 4s. 4½d., and at the latter figure the market closes firm. Bank has been done at 3s. 11½d. for 6 months' sight and 3s. 11½d. @ 3s. 11½d. for 60 days.

On Hongkong and Seanghai there is not much business to report.

We quote:—London Bank, 6 months' sight 3s. 11½d. sight, 3s. 11d. Credits 6 months' sight 4s. 0½d. Documents, 6 months' sight 4s. 0½d. Documents continental, 4s. 0½d. Paris Bank, 6 months' sight 5.00. sight 4.99. Documents, 6 months' sight 5.00½. Shanghai Bank Bills, sight 72½. Private, 10 days' sight 73½. Hongkong Bank Bills, sight 1½ o/o disc. Private, 10 days' sight 1½ o/o disc. San Francisco Bank sight 95. New York Bank, sight 95. BULLION. Gold Yen 392, Kinsats 427½.

*. The dates of Arrival and Departure of the Mitsu Bishi Company's steamers are susceptible of alteration, consequent on the necessity imposed upon the Company—by its contract—of connecting with the steamers of the Pacific Mail.

*. No days for Arrival or Departure of the Pacific Mail Company's or Occidental and Oriental Company's steamers having as yet been fixed, we are unable to tabulate them. Each separate steamer's departure from her port will be notified in the Table below, and the day of her probable arrival at her destination.

*. Three days are allowed in the P. & O. Company's Schedule for transit of the Mails between London and Brindisi.

*. Two days are allowed in the Messageries Company's Schedule for transit of the Mails between London and Marseilles.

SCHOOL FOR CHILDREN IN SWITZERLAND.

MADAME A. JAQUEMOT (née Dogny) proposes to establish at Geneva, Switzerland, a Boarding School for Girls, and for Boys under 12 years of age; where they will have the advantages of a sound education and sedulous domestic care.

Boys over 12 years of age may be committed to Madame Jaquemot's charge as boarders, and parents can thus secure for them the comforts of a home, with the opportunity of attending one or other of those educational establishments for which Geneva is so justly celebrated.

Parents wishful to place children under her charge at the Pension Dogny, may address their enquiries as to terms &c. to the Editor of the *Japan Times*, who is empowered to furnish them.

THE SILKWORMS' EGGS NOTIFICATION.

IN THE columns which we devote to translations from the native press will be found an article on the Notification freeing the trade in Silkworms' Eggs, which we published a fortnight ago. As we feared, the more active minority in the Silkworms' Eggs Business Association has succeeded in carrying its point against the majority who passed the Resolution fixing the production for this year at 1,300,000, so far as to have procured the publication of this Edict, which cancels a number of previous ones which tended to restrict the trade. According to the *Chiugai Bukka Shimpō*, any kind of paper may now be used for the egg cards; traders are not compelled to join the Silkworm-egg guild, growers in one district where mulberry leaves are scarce, may import them from more favoured neighbourhoods; the quantities produced are no longer subjected to any governmentally-named limit; nor is any distinction made between eggs produced for home, and those produced for foreign purchasers; and, finally, the stamp tax on the cards is taken off. The trade, in fact, is left entirely to its own devices.

We ought, of course, as Free-Traders, to hail this edict of the government with acclaim; and this we should certainly do, if we had any confidence in the judgment and discretion of those engaged in it. The very first pages of this Review were devoted to a somewhat elaborate attempt to show the native silk-growers in what direction their profit was to be sought. We asked 'Why should Japan silk-growers allow Japanese silk to be grown in Italy?' and proved, to the satisfaction at least of foreign experts that Japanese should devote their efforts towards improving their own class of silk, which is of special and high quality,—by processes of careful selection and breeding of only their best worms, and by the use, where advisable and available, of foreign appliances and methods of reeling,—so as to educate, up to the highest point of perfection in colour, strength, and regularity the production which Nature has so bountifully bestowed upon them. We went on—with a disinterested disregard of foreign special interests, which ought to have won us the grateful applause of the whole native silk trade, to show how Japanese silk-growers held in their own hands the power to create for themselves, without Governmental assistance by either subsidy or protective edicts, a virtual monopoly for the very high class of silk which could be produced here,—by the charmingly simple process of producing only sufficient silk seed for their own wants, and declining to furnish France or Italy with the means of competing with Japan on what she ought to reserve for herself as her own special ground. We have to confess to a certain amount of disappointment that our arguments then appeared to attract but little attention in the native press: but perhaps a better result could hardly be expected,—the feeble pipings of the voice of the infant *Times* could not have been heard afar. We are encouraged,

however, to make another attempt to save the native silk-trade from loss, and again to point out the way to profit, by remarking that the *Chiugai Bukka Shimpō*, the *Economist* of Japan, does make slight, though somewhat incorrect, reference to our advice, in the article under review. Our native contemporary says:

"It may be argued:—is it not better to prohibit the export of our silkworm eggs, so as not to let the same quality of raw silk as ours be manufactured in Europe? Indeed, this is often argued by foreign newspaper editors and is a very useful suggestion. But" (the *Chiugai* goes on to say) "although we have the same object in our mind also, this is a matter impracticable until after the treaties with Foreign Powers shall have been revised."

It is perhaps hardly worth while setting our contemporary right respecting the source of this idea. Our foreign readers will remember that—so far from any other of the "foreign newspaper editors" supporting us—our proposal was combated and ridiculed where we most looked for aid. But the writer in the *Chiugai Bukka Shimpō* runs entirely off the line in the last clause of his sentence, showing that our article of January 5th had been carelessly read or not fully understood. We specially insisted on the point that the protective measures we urged on the trade could be taken by themselves, depended on themselves to take, and could not be prevented by foreign diplomatic action. "This is not Fiscal Protection," we wrote:—

"This is not Fiscal Protection. Nothing need be asked from their own native Government by the silk growers, nor feared from foreign Embassies. It is simply an act of legitimate self-protection by the trade; of availing itself of advantages which Nature has given to it, and which no one has a right to demand that it shall share with its rivals."

We cannot state this more clearly or more succinctly: and our contemporary is completely astray in imagining that either governmental action, or Treaty revision is necessary for establishing the virtual monopoly in particular classes of silk which we show Japanese silk-growers how to secure. On the contrary, any attempt by the French or Italian Minister to bring pressure to bear in Tōkiō, to compel the export of eggs, would be an infringement of the Treaty, would be Fiscal Protection (of the French and Italian trade) and would be opposed, of course, by the Minister of free-trading England.

So convinced are we of the soundness of our views; of the advantages which would accrue to our Japanese friends in the silk trade and, correlatively and ultimately, to the general foreign silk-trade also, by improving the quality and, especially, steadying the position of Japanese silk, that,—in the frequent references we have made in our leading columns and Editorial Notes, to the subject of Silkworms' Eggs and their exportation,—we have even gone so far as almost to beg for Governmental interference—a sacrifice of principle to expediency. But Govern-

mental interference then existed, to a considerable extent, and this slight increase of its pressure—wholly for the good of the trade—could be without much difficulty reconciled to our Plutonomic conscience. But now that Government has taken the bold step in the direction of Free Trade,—a step we hail with the greatest satisfaction,—of declaring the whole trade free, and giving up its revenue from the sale of cards and stamps; it would be hardly consistent in us to call for new forms of restriction. But we must, therefore, the more strongly urge upon the trade itself the policy of abstention, and we invoke the assistance of the native press, notably of the *Nichi Nichi Shimbun* and of the journal which we quote to-day, in bringing our arguments to bear on those concerned. These newspapers can best do by translating our article of January 5th; for us, it only remains to repeat—that if Japanese silk-growers will but combine for a single season in the manner we suggest:—will grow eggs only for their own wants, and only those of the best qualities, freely supplying these to less favoured districts, but declining altogether to furnish them for export, or indeed to bring them to Yokohama at all—they will at once realize the value of our advice, by witnessing a rise in the price of Japan silks in stock at home, and a corresponding increase in values here for the whole of the new crop, which will far over-balance any possible profit they are likely to get from the sale of a moderate quantity of eggs—while they will be spared the disastrous loss which is also too likely to result from the recent Governmental action, which, while it frees the trade, unfortunately leads speculators into temptation and stimulates production in excess. Surely past experience ought to have its weight, too, with the trade. A few gambling middle men may have made, and lost, fortunes; but to the up-country grower and the native merchant here the whole operations of the past decade have shown a decided loss. Nor is this the only consideration which should induce the Japanese silk merchant proper to discourage the export trade in eggs. If Japanese silk were all the produce of worms from eggs carefully selected, laid by the strongest moths, and these parents judiciously chosen and crossed from the best breeds, the quality of Japanese silk would go on improving until it reached perfection: but now, with an export trade in eggs acting as a temptation to over-production of seed, no care is given to this all important question of selection, the object is only to fill cards, and all the eggs laid, good, indifferent, and bad, pass into the market. If France and Italy want many cards, and prices rise, the reserves of those retained for country use, which have had the advantage of some sort of selection by the only people who can know how they are likely to turn out,—the breeders—are drawn upon and their places filled by inferior seed. If the supply is greater than the demand, the excess is not always destroyed, but thrown back on the country and used for the production of silk. In either case the 'nerve' of the fibre suffers and the silk deteriorates, as we see, instead of improving. Of course, should France or Italy be starving for eggs, as has been the case before, Japan should not grudge, in charity, to spare from her overflowing store: but while the trade remains undisturbed by accident or catastrophe, for the Japanese silk-grower to throw away advantages which are his by Nature's law, and refuse to use means for his own protection and profit, which are clearly as legitimate as they would be found effective, is simple, almost suicidal folly, and deserves no other name.

THE LESSONS OF THE ASSASSINATION.

MORE lessons than one are to be learnt from the assassination of Okubo Toshimichi. In the first place, the fact that it was not prevented is discreditable to

the police. We have no reason to doubt the statement that the local authorities of Ishikawa Ken warned the Central Police office in the capital, that a band of dangerous young men had left for Tokio, apparently bent upon some deed of violence, and yet no attempt seems to have been made to trace or watch them. Foreigners in Yokohama have long had reason to know that for protection of their lives, persons and property, the Japanese police is worse than useless. Any application to them for assistance in emergency is only met with a shake of the head and a smile, indicating satisfaction at the applicant's being in trouble, and foreign ladies are insulted, and drunken sailors robbed and maltreated, while native policemen stand by, amused spectators. So numerous, too, so impudent are the burglaries, that it is impossible to avoid the conviction that the so-called 'guardian of the night' shares the plunder of the thieves. Under no other supposition can be accounted for, the robbery which occurred a few weeks ago, when the padlocked door of a warehouse was broken open, and thirty three cases of goods abstracted and removed in a perfectly leisurely manner. But such an enormous force of police is kept up, and so much money is spent upon it, that the life of a prominent native statesman might surely have been protected, and it is inexcusable that the band of men who killed Okubo should have been left unmolested to perpetrate their crime. It appears probable, too, that—had such been their pleasure,—they could, with equal ease, have escaped their punishment. They must have been for some days in Tôkiô; for they had to ascertain the locality of the Minister's house, and to make themselves sufficiently acquainted with his habits to enable them to plan their ambushade. The letter of warning sent to Okubo himself is a corroborative proof of this, and we are fully justified in reprehending, in the strongest terms, the supineness of the police, which allowed the plot to develop into consummation, undetected and unchecked.

Reform is evidently needed here. But the assassination teaches another lesson. Of the dead statesman's surviving colleagues, there are others who must know that they are equally obnoxious to the old conservative party, which disapproves equally of the admission of foreigners to Japan, and of the adoption of foreign customs, arts and sciences. These should avoid Okubo's faults of recklessness and disregard of danger, which appear to the foreign mind as remarkable as the inefficiency of the police, and actually reprehensible. We can make all due allowance for a creed of fatalism, and for a belief that the respect won by disdain of danger was worth the incurred risk. But to a man engaged, as Okubo was, in working out a new policy, obnoxious to many of his countrymen, though—as he knew it—certain to procure their ultimate good, it should have been seen to be a clear duty to guard a life that was so valuable to his country; and, to our thinking, this consideration should have outweighed all others. Nowhere is a prominent statesman secure from the attempts of political fanatics, or it may be of lunatics, to remove him by assassination, in the expectation that, with him, will die his policy or his system; but in most countries, a would-be murderer generally fails in his attempt, because it is hampered with the design and desire to escape after perpetration of the deed. Therefore, in European countries, but a small percentage of such attempts are successful. But, in Japan, a diametrically opposite sentiment appears to actuate political assassins, and consequently the *minimum* is found in the percentage of unsuccessful crimes. Men here who design to kill a statesman, seem to consider their work incomplete unless they can give full publicity to their reasons for their act; they weigh their own lives as nothing in the balance against this necessity, and would rather give themselves up to torture and death, than risk their motives remaining unknown. We can call to mind, at the moment, but one in-

stance in European history which parallels the Japanese practice. Felton, the murderer of Buckingham, in 1628, wrote a statement of his reasons for the deed he meditated, signed it, and placed it in his hat, and was apparently seeking some one to whom to give himself up, when he was arrested. But, in general, anxiety to escape has happily marred the full execution of the purpose; whereas, in Japan no such condition prevents the crime. And what makes Okubo's carelessness the more remarkable is, that he, and his colleagues or predecessors in office had always shown themselves fully alive to this special characteristic of the Japanese political assassin, when the lives of Foreign Ministers, or even of foreigners of less importance, were threatened. Most of us remember the annoyance to which we were subjected, but a few years ago, when any necessity took us to the capital, of being surrounded by an armed guard. But foreigners, merchants and Ministers, alike, recognized the necessity of the precaution. Only a very few years have elapsed, since a revolver was as universally worn as a waistcoat, and a Foreign Minister would have moved about in Yedo without his hat, as soon as without his guard. And as foreigners were regarded then, by the reckless *Samurai*, so the men who administer the Mikado's government are regarded now;—nay, with an even deeper detestation, as oppressing the class, by depriving them of their privileges, their rank, even their means of subsistence; as traitors to their clans and forsworn to oaths of fidelity to their chiefs. Of all this Okubo and his colleagues must be aware, and should not have disdained to guard themselves as carefully as their foreign visitors. Surely some precautions should be taken, beyond that proved inefficient one of travelling in a carriage, instead of in a *norimon*. They need be but simple. A couple of mounted police, armed with repeating rifles, and skilled in their use, would have made this murder, for instance, impossible. Had the Minister and his coachman, even, had revolvers lying by them, in all probability the attempt would have resulted in failure. It is true that, important as was Okubo's life,—'right arm of the government' as his Sovereign denominated him when lamenting his death to the *Chihokuwan Kuwaigi*, his death has not stopped the machine of the State; true that his policy survives him;—but how many more such shocks could it stand? It surely becomes an urgent public duty for the Cabinet Ministers, and their most prominent assistants in carrying out the new régime, to surround their persons,—whether in their houses, offices, or in the streets,—with such safeguards as will render any such calamities in the future, as nearly as may be, impossible.

We may also suggest that, besides making attempts at assassination more dangerous to the assailants, there is another deterrent to men who may be meditating similar crimes, of which the Government should avail itself. That the bodies of Saigo and his companions in arms should have been interred with respect, and worship permitted at their tombs, were proper displays of magnanimity by the victorious Government. These men were mistaken in their revolt, but they fought openly, and carried on their warfare with due observance of the rules of war. And they fell most gloriously, and deserved all the posthumous honour which their countrymen can bestow on consummate bravery. But the murderers of Okubo Toshimitchi belong to a different category: assassination is not a legitimate form of war; for six armed men to set suddenly upon one unarmed, and to kill him and, with him, an innocent servant, is not a brave, but a cowardly act, and as vulgar and cowardly assassins, these men should be punished. They deserve degradation from their rank and death at the hands of the common executioner; this they know and expect; but their hope of an honoured tomb in the future should be defeated by the destruction of their remains—as in

Europe—by quick-lime in a prison pit. No public parade or execution should give them the opportunity of posing as heroes before the populace of the capital, and the very whereabouts of their dishonoured graves should be concealed. Discontented *samurai* who are rejoicing over the downfall of Okubo, and meditating the destruction of Okuma, Ito and others, in similar fashion, should be let to know that not only will such attempts in future be fraught with as much danger to their own lives as may suffice to defeat their purposes, but that—should they succeed, degradation of their names and oblivion of their graves will as certainly form part of their punishment, as that extinction of their lives of which they reckon so little. It is of no avail to tell such men, because their convictions are fixed to the contrary, but it is as certain as sunrise after night, that their memories will hereafter be execrated by succeeding generations of their countrymen, as those of mischievous fools who sought to put back the clock of Time by destroying a useful life: and no false sentiment, no respect for old customs, should be allowed now to intervene which might check the growth of so wholesome an estimate of their character and their deed.

A daily contemporary, in a very able article upon the assassination, appears inclined to attribute it—as well as the various rebellions which have embarrassed the Government of the Restoration, with other political murders, and attempts at murder,—to an uniformly repressive policy which has gagged the press and denied to the people representative government. We can go but a little way with the *Japan Herald* in this direction. We fully agree with it, in recognizing the connection of cause and effect between the existing despotism and rebellion and murder. But we cannot accept the deduction that, therefore, an unfettered press and free representative government would be benefits to the country. To our minds, they would land it in anarchy in a month. This people has, for ages, been so accustomed to be governed, and governed in the minutest acts of life, that it is totally unfit to govern itself. It is a truism to us Europeans that a free press and free parliamentary institutions are safety valves for discontent, which prevent explosions such as these we have to deplore in Japan. But the very existence of safety-valves presupposes an intelligently and skilfully constructed machine. Constitutionalism is the growth of centuries, and without the restraining powers of public opinion and conservative checks which grow up, side by side, during the ages, with freedom of thought and speech, these forces are capable of bringing upon a nation calamities worse than anything that personal despotism inflicts. Modern French history gives the 'philosophical speculator' many a proof of this truth, from the Reign of Terror to the burning of Paris: we have a sufficient example in the recent passage of the American Silver Bill over the President's veto to show us how free parliamentary institutions can impair a country's credit, while we need not go farther than Tòkiô to see how a free press often stains her citizens with disgrace. Nothing in the history of Japan for the last ten years has given any ground for belief that the present generation, as a generation, and excepting isolated individuals—are fitting themselves, while laying down their murderous swords, for the use of such double-edged weapons as a free press and free parliament. The press did not enjoy six weeks of 'freedom' before it began to advocate political assassination; and among the first measures brought forward in a 'free parliament' would certainly be the expulsion of foreigners and probably the abolition of monarchy. It appears to us, on the other hand, that the present Ministry have been seeking to give, to both press and people, fully as much license as will be good for them for many years to come. The deliberations of the *Chihokuwan Kuwaigi* have been to the full as free as were those of our own House of Commons

under Elizabeth, and in the next number of our Review will be published the Municipalities Bill, mainly Okubo's work, which lays the foundation of representative Government. While, in another page, an article translated from a leading native newspaper, inciting the subjects of a friendly Power to revolt, evidences surely a sufficiently lax censorship of the Press. No—the Government of Japan must long continue a despotism; it should be the care of those who have to administer it, so to guard their persons that it shall not be 'tempered with assassination'; and the people should be taught that abstention from such crimes is needful to prove their fitness to be trusted with other means of removing an obnoxious Minister from the councils of his sovereign, and should be told, too, that every such act postpones the day when these longed-for powers can be placed in their hands. Citizens of a free country ourselves, and enjoying the blessings of that freest form of Government—Constitutional Monarchy—(for the tyranny of a mob is worse than the tyranny of a Tzar), we shall hail with pleasure each judiciously progressive step towards this true freedom in Japan. But the youth of these assassins is a most discouraging symptom—most of them must have been mere boys when the Restoration took place ten years ago—and it would appear that even this rising generation will not be fit to be trusted with more than a shadow of representative government. It may be that we are wrong: it may be that these youths are not fair samples of the mass. We are willing to hope so, but we doubt. Meanwhile, it rests with the rulers who have to educate and the children who have to learn, to determine whether the gift of constitutional freedom can safely be trusted in the hands of the Japanese of the nineteenth century: whether it must not be reserved for a generation yet unborn.

A VERY sufficient reply to one of the charges that was often, before his assassination, brought against Okubo, and alleged by his murderers as one of their reasons, or excuses, for their crime—that he aggrandized his own estate at the expense of the public purse—is the fact now ascertained beyond a doubt, that he has died a very poor man. After paying his small household debts, the balance remaining of his 'fortune' is one hundred and forty *yen*; about £28 sterling! The congratulatory presents of the Emperor and Empresses, on the occasion of his being posthumously invested with the title of *Udajin*, amounting to seven thousand *yen*, is all, therefore, that his family have left to live on. As we have seen, during his life he refused more than one pension, and on his Imperial Master insisting on his acceptance of one, he handed it over to the Board for encouraging Native Industries, an object he always had peculiarly at heart. We now learn that, a week before his death, he had mortgaged his house, and, adding to the sum realized all that he could scrape together, made up a sum of eight thousand *yen*, which he remitted to Kagoshima, to be laid out in rebuilding houses, and in other ways relieving the distress of the inhabitants who had suffered during the war, a body of people, of course, bitterly opposed to him and his policy. The return of this remittance has been telegraphed for, to be used in defraying the expenses of his funeral, there appearing to exist a strong prejudice in Japan, which prevents a man's relatives accepting aid from public or private funds for such a purpose. But the same amount has been subscribed and remitted to Kagoshima in his name, to replace his actual own cash returned, and to ensure that one of his last generous wishes should be carried out.

Okubo, like most great statesmen, seems to have been quite indifferent to money, and careless of his own fortunes. He dedicated his life and what monetary rewards his labours incidentally brought him, wholly to his country's service; justly depending on his country's gratitude for necessary

support in his declining years, should he live to retire from active life—leaving his family as a legacy to his country, should he be cut off in his prime. The murderous hand of blinded Faction has shortened his useful life; his bequest must be generously administered to: and the first graceful acknowledgment of his services already made by the Crown is an earnest that this will be done.

WE fully believe the information we receive that His Majesty is overwhelmed with deep personal grief at the loss of his faithful servant. We hear that, since the event, he has remained shut up in his private apartments, and finds himself unequal to transact any business. Loneliness is one of the penalties which sadden the lives of those who sit on the splendid heights of thrones: to be deprived, one by one, by death, in violent fashion, of the statesmen and warriors who have elevated him to a far higher position than that occupied by almost any of his long, illustrious line, must greatly embitter the lot of the young Emperor of Japan, and sadly dim the lustre, while it adds to the weight, of the diadem which rests upon his brows. Two dignified public expressions of his sense of loss, he has taken opportunity to make—one, in his Message to the bereaved family, accompanying the patent addressed, in Japanese fashion, to the dead statesman conferring on him enhanced rank; the other, at the audience to which His Majesty summoned the members of the *Chiho Kuwan Kuwaigi*. We trust that the words used by him on this occasion will be carried by the Governors, into every province of the kingdom, and there bear their fruit; and that the people under their jurisdiction may indeed be "so instructed, that we shall have no more of such misguided men as those who slew Okubo Toshimitchi, indeed the right hand of the Emperor."

ONE of the assassins, we hear, ascertained, by enquiry at his house early in the morning of the murder, whither the Minister was going that day, at what hour he would set out, and what was the route his carriage usually took. Considering that, two days previously, Okubo had been warned by an anonymous letter that his life was in danger—a fact which must surely have been known to his household; for he appears to have made no secret of his receipt of the letter—and to have treated it lightly,—as a weak 'invention of the enemy'—it is not a little remarkable that these enquiries should not have excited the suspicion of his servants. But in every case of a successful political murder in this country, Chance seems to favour the criminals in the same unaccountable way. Precautions, obvious after the event, are not taken, warnings are unheeded and evil seems to be allowed to have its way in a fashion which greatly tends to shake one's faith in the doctrine that any omniscient intellect watches over the affairs of our little world.

EDITORIAL NOTES.

SOME changes in Governmental arrangements have been necessitated by the removal of Okubo. Ito Hirobumi, as we stated last week, has been appointed Minister of the Interior, retaining also the Presidency of the *Gen-rō-in* and also that of the Legislative Department of the *Daijokuwan*. We now hear that General Saigo, recently appointed Ambassador to Italy, will not leave for Rome immediately, it being thought best to postpone his departure for a while, and to keep him here to strengthen the Government. Enoyue, formerly Vice-Minister of Finance, and now in London, was telegraphed for on the day after the murder, and requested to return to Japan as soon as possible.

WHEN reviewing as fully as they required, or deserved, the estimates put forth by H. E. Okuma Shigenobu, the Finance Minister, last January, of the year from July 31st 1877, to June 30th 1878, we had to treat them, in common with all our foreign contemporaries, as practically

valueless, because they were only estimates—as were also the figures for the parallel period for 1876-7, reprinted from his previous annual statement. Whereas, had the actual *expenditure and income* of the previous period been given, his estimates for the current year would have been of value. But, we urged in extenuation, even these estimates might perhaps include the actual facts for the period July to December 1877, and showed how—if this was the case, a certain amount of weight was due to the document.

Now,—we are pleased to hear, His Excellency is having prepared for publication, in July or August, the accounts of actual expenditure and income for 1877-78. We shall be extremely glad to see his accounts and, whether they accord with his estimates or not, their publication cannot but strengthen, because it will certify, the financial position of the country. It is only with these solid figures and facts before him, that a Chancellor of the Exchequer can plan, or his financial counsellors advise upon, the Ways and Means of a nation. In England, by our own Quarterly Returns of Trade, and Treasury and Board of Trade Reports for the same period, which are regularly published in the *Economist*, all interested in British Trade and Finance are not only kept informed of the progress of the nation, but can intelligently and with approximate accuracy, foretell the course of trade during the next following period, due regard being had to prospects of crops, and political events and contingencies. We strongly advise the Japanese Minister of Finance to imitate as closely as possible the procedure and method of keeping accounts practised by the acknowledged leader of the commercial nations of the world.

A VERY sensible, short, article is quoted in our translation columns to-day, from the *Chiugai Bukka Shimpō*, urging the people of Japan to patronize their own manufactures which are now produced, in great variety and quantity, in imitation of foreign makes. We might go farther than the writer, and urge upon his countrymen, that they should patronize their native manufactures even though they may be slightly inferior in finish and appearance—for we quite endorse what he says of the intrinsic honesty of quality of most of them—to foreign imported goods. There are exceptions, of course; notably in lucifer matches, which he unfortunately picks out as 'greatly improved in quality, and not inferior for practical use.' This is very far from being the case, and as—in fact—half-a-dozen of them have to be struck in the attempt to get a light, against one of Bryant and May's make, the fact that the Japanese matches cost only one-third of the price of the English still leaves them, in effect, twice as dear. But that many Japanese imitations of foreign goods, specially in clothing, are both better and cheaper, and will wear longer, than their prototypes, is evidenced by the fact that they are largely used by foreigners whose means do not allow them to be particular about fashion or finish, and there are shops in the native town which quite seriously compete with the foreign 'stores' in such articles as underclothing and hosiery. We are quite with the writer in his recommendation to his countrymen to encourage native industries; and the Court and aristocracy should set the fashion of using them, as our own Queen has worn Irish poplins, Limerick lace, &c., to encourage the industries of Great Britain. The problem has yet to be solved whether Japan is to take rank among the manufacturing countries of the world, or may, more profitably confine her attention to the production of raw material. This is purely a question of the most profitable employment of labour. She has cheap coal, but most of her machinery has to be imported, and this is of course, against her: but a fair field, and even a little favour, ought to be given by those who set the fashions here, to articles of native make.

DE mortuis nil nisi bonum is a time-worn and much abused, though kindly proverb, and we cannot be severe upon the defunct *Choya Shimbun* for its publication of the article 'England's distress India's opportunity', which we had in type some days before the suppression of that journal. We publish it, and refer to it here, merely as a somewhat typical sample of the way in which the native press writes of foreign affairs. During the Satsuma rebellion, much was written by foreign journalists which had better never appeared, but we do not recollect any such distinct suggestion as this, that a part of the Empire

should rise against the Government during its struggle for existence. Foreign journalists, self-constituted apologists for all that the Japanese,—government, press, or people,—can say, write, or do—who excuse assassination of foreigners and advocate restriction of foreign trade; might usefully devote some few drops from the vials of their wrath to the canterization of such pernicious articles as these, which too often disfigure the columns of the native press, and tend to retard its release from the censorship of which it so loudly complains.

WE HAVE neither space nor time at our disposal to write a rejoinder, to-day, with the minuteness and care which the subject deserves, to Dr. Mayet's reply to our second article reviewing his very interesting paper on compulsory Fire Insurance in Japan. We will merely now express our willingness to qualify the epithet 'fatal' which we attached to our second objection to his scheme,—that by Government taking all the house insurance, and leaving contents of warehouses, &c., uninsured, it discouraged private enterprise in the same direction. The objection is a strong one, but—as he points out, not logically 'fatal,' and we withdraw the expression.

But we cannot own, we confess, that any conviction of error on other points of our view has as yet been borne in on our mind by Dr. Mayet's letter. We shall not drop the subject, and shall be glad to see the second paper promised us. Meanwhile, as his proposition stands, it appears an excuse for an impecunious Government to levy an unequal tax on house property, and smacks, too, of Governmental interference with private enterprise. We are not as sure as Dr. Mayet appears to be, that the idea of insurance—particularly as applied to shipping—is totally unfamiliar to the Japanese mind, and we are inclined to think that the main reason which has hitherto checked the establishment of Fire Insurance Companies, has been the style of building in towns. Fifteen per cent is really too much to contemplate as premium, and yet, in the capital, seven years is always held to be a fairly average life for a house. We should not be surprised to hear, either, that some provision for rebuilding houses in country districts is already existent. But we can only thus briefly acknowledge our correspondent's letter to-day and must postpone fuller discussion of it to a future occasion.

WE invite special attention to Dr. Wagener's most remarkable paper on Chinese and Japanese weights and Measures, which we translate from the Transactions of the German Asiatic Society, and publish below. Not only is the connection between Chinese and Japanese weights and measures clearly shown, and their origin satisfactorily traced, but a connection is established between Chinese weights and measures and the musical scale which will, we imagine, interest and astonish most of our readers as it has ourselves. Mathematicians know how theoretical music and pure mathematics are allied, and that a deaf and dumb student can construct a perfectly correct score. And also that Pythagoras was the discoverer, or inventor, of the musical scale. But this account of a Chinese sage, nearly five thousand years ago, constructing a harmonized system of music, weights and measures, all evolved from a keynote out of a bamboo pitch-pipe, shakes our faith in the great Samian's originality of conception, or throws conjecture back on coincidence, as the only defence of his mathematical reputation.

PAPERS OF THE GERMAN ASIATIC SOCIETY.

(Specially translated for the 'Japan Times'.)

HISTORICAL ACCOUNT OF THE SYSTEM OF WEIGHTS AND MEASURES IN CHINA AND JAPAN.

From information supplied by Mr. NINAGAWA NORITANE.

By Dr. G. WAGENER.

A COMPARISON of the expressions used in different languages for lineal measurement shows, in a manner that admits of no doubt, that their origin was almost everywhere the same. At a time when the wants of mankind did not extend beyond such things as every family could procure by its own labour, approximate dimensions were quite sufficient for ordinary intercourse, and nothing was more natural than that people should use for that purpose what

was always at hand; viz: their own limbs. The German words "Fuss, Elle, Spanne" (foot, ell, span); the French "pied, ponce," the Italian "braccio" etc., are complete proofs that the origin of these measurements is peculiar to no one country. Japan is no exception to this, for the system used in the beginning of historical times, that is, about 2,500 years since, arose in the same way. The unit of measurements for ordinary small objects was the "Yada," or a small span,—the distance between the top of the thumb and that of the middle finger, when they were spread out to the greatest possible distance. The next smallest unit was the "Nigiri," a word which is still used to denote the left fist when it holds the bow. A subdivision of the fist was most naturally the thickness of the finger (*hon*, also, according to the number which was prefixed, called *pon* or *bon*) and next to the "fist," came four "fingers." Greater lengths were expressed with the help of the "Hiro," that is the space between the finger tops when the two arms are spread out. This corresponds to the German "Klafter," (fathom) and to the French "brasse," and it was used precisely like the two latter, in expressing the lengths of ropes and the depth of the sea. The foot, in Japanese, "*Ashi*," which can be rendered either by pace or by foot, was the unit of measurement for horizontal distances on the ground; and also for roads and land. It cannot be gathered from the usages of the language whether the foot was also used as a linear unit; but the word *Shaku* (尺) which has come from the Chinese, and which we call a foot, means generally only a measure of length, or an instrument for measuring lengths.

Like the linear measure, the measure of quantity (dry measure) was, in the beginning, very primitive. The measure for grain was the "*Sassuye*," and corresponded to "both hands full." The first, during the reign of Emperor Suinin (in the first century before Christ) to introduce a real vessel for measuring grain, were the Shintô priests of the *Miya*. This vessel consisted of a wooden bowl, of the size and shape of the two hollow hands held together, and was first used with the object of measuring out their pay to the workmen employed in the temple, in the shape of rice rations, and probably also for the purpose of laying somewhat more certain foundations for estimating the revenues of the temple. To this day wooden bowls of a similar form are used in the *Miya* at certain festivals, to convey rice to the altar.

This very imperfect system seems to have been in use for centuries, and was not improved until Japan came into closer contact with neighbouring countries. This occurred in the third century after the birth of Christ, under the celebrated Empress Jingū. Her predecessors having subdued Japan by long wars, and divided it into provinces and districts, and having completely established their rule, this energetic Empress undertook a campaign against the Koreans, defeated them in several battles, and laid on them a tribute which was paid for a long time afterwards. By means of the Koreans, the Japanese now received a more exact knowledge of China and of Chinese learning under Ojin Tennō, the successor of the Empress Jingū, who reigned from 270 to 313 after Christ. The Korean scholar Wani brought the philosophical writings of Confucius to Japan. At this time also a linear measure, the Korean foot *Horai Shaku* or *Koma Shaku*, was introduced. What we now call Korea consisted of three provinces; Koma or Horai; and Shinra and Hakusai, united under one ruler, and these three were known as Sankan or the three Kingdoms. The length of this foot was 1.173 (1 *Shaku*, 1 *Sun*, 7 *bu*, 3 *rin*) of the present Japanese foot; for square measure a length of five feet 'Jip-po' (*bō*, a pole, similar to our perch).

Chiefly through the agency of the Koreans, in the course of the following century, the Chinese characters; different industries; improvements in the building of houses; the Buddhist religion &c., were introduced into Japan. With the object of coming into more direct relations with China, the Empress Suiko (593-629) sent an Ambassador Extraordinary thither, and during her reign the more complete Chinese system of weights and measures was adopted.

Following the example of China, two systems called the *Dai* and *Shō*, or "greater" and "less" measurements, were used, side by side, according to the nature of the object to be measured. But as it was not easy to abolish at once the Korean foot, which had been used up to the present, and which was two inches larger than the Chinese *Daishaku* or great foot; it was made the Japanese *Daishaku*

(1.173 of the present ordinary *Kanashaku*), and the Chinese "great foot" became the Japanese "small foot" or *Shō-shaku* (.968 of the present *Kanashaku* or *Kanashaku*); * the latter is also called *Mempio-shaku* after the period (628) in which it was introduced. It follows from these numbers that the latter differs by only about two lines from the *Kanashaku* or ordinary foot; and it appears that this error gradually arose in consequence of the incompleteness of the mechanism for dividing the scales; for up to a short time since, people thought that the ancient foot and the present one were the same, especially as it was quite certain that no change had occurred in linear measurements since the 8th century. It was first discovered twenty years ago that such a difference existed, by comparison with four old measuring scales which were preserved in Nara.

The great, that is the old Korean foot, was used chiefly like the German ell, in measuring clothing, and is therefore called also *Gofuku-shaku*; for this purpose now however the *Kujira-shaku* is used, which was introduced two hundred years ago, and which is about five lines longer. (*Kujira*—fishbone, from which the ell is frequently made).

Dry measure has undergone more changes than linear measure, partly because it plays a not unimportant part in finance, as all the taxes had to be paid to the government in kind.

At the same time as the linear measurement, the Korean measure of quantity, the *Shō*, which is about half of the present *shō*, was introduced. It is at present generally used in Yamato, where, in the town of Nara, a standard measure has been preserved since ancient times. At the time of the transition from the Korean to the Chinese system, the *Shō* was naturally taken as the unit of dry measure and as it was almost a third smaller than the *Shō* hitherto used, it received the name *Gen-tai-shō* or the diminished *Daishō*, from *Genjiru*, to decrease or diminish. This reform could progress but slowly, and it can easily be understood that it occasioned much difficulty, as a change in measures of quantity must, at that time, have interfered to a much greater extent with all the customs of trade and intercourse, than a change in linear measurement. Hence the Government thought, about a hundred years later, in the time of Monmu Tennō (697-708) that it would be forced to return to the old Korean *Shō*. Meanwhile, however, the people, here and there, had commenced to accustom themselves to the new measure, and had made the necessary vessels. It happened also that both were used, for a period which must have been some centuries. About the year 1,000 in the period Chōhō, another reform was made, by which both measures were relinquished, and a new *Shō*, which was double the Chinese or *Gen-tai-shō*, was introduced. A vessel containing this measure, called the *chōhō-masu*† is still preserved in the Ministry of the Interior, and another at Nara. Moreover it has still maintained itself in some districts, especially in the neighbourhood of Kiōtō, in Yamashiro and Goshū, where it is still used.

Subsequently, this measure was also changed. There are still five *shō* measures existing in Japan belonging to the latter half of the fifteenth and first half of the sixteenth century, which all resemble each other, but are twenty per cent greater than that used up to that time. This was the time of long civil wars, and the increase in size of the dry measure is explained by the financial embarrassments of the government. In similar circumstances European Princes had recourse to the notorious expediency of debasing the coinage. This was not possible in Japan, because coined money, at least gold and silver coins, were in very small quantities, and besides, it would have been of little avail, as the taxes were paid to the government in certain quantities of rice. Simply to raise the taxes and instead of five *koku* to demand six, seemed a doubtful expedient, on account of the dissatisfaction which such a measure must necessarily excite among the farmers. It was therefore concluded to attain the same object; namely the increase of the revenues of the State, by an ordinance which seemed less heavy, and by a course which was to a certain extent concealed. This precedent was followed subsequently by Taikō-Sama, who also carried

* This is so called because it is chiefly used by Carpenters and the rule is generally made in the form of a right angle. The character for *Kōe* (角) is the same as that for *maguru*, bent, not straight.

† The word *masu* is used in Japanese for every vessel used as a measure of quantity. People say *itto-masu*; *isho-naru* &c. according as the vessel holds a to, a *shō* &c.

on many wars, and raised by eight per cent, the measure which was already increased. While the first contained $5' \times 5' \times 2' 5''$, he deepened it by two lines so that it contained $5' \times 5' \times 2' 7''$. But it could not now be otherwise than that the people would be much displeased with this arbitrary act, and that the government would be much discredited thereby. In order, therefore, to recover its good character, and also as peace was now assured, one of the Shôguns of the Tokugawa family thought it desirable to diminish the measure, which was accordingly done by a government order from Kiôtô, in 1623. The new measure was therefore called the *kiô-masu*, and the dimensions of this *sho* are $4' 9'' \times 4' 9'' \times 2' 7''$. This is the measure used at the present day, and by the last ordinances of the government it has become necessary to employ it all over the country.

Japanese weights do not exhibit much peculiarity and are essentially imitated from the Chinese. The unit is the *momme* (in Chinese *lian* or in mercantile language *mace*) which was introduced about 700 years after Christ; nevertheless the real Japanese pound or *kin* has 180, not 160 *momme*; besides, there was also the old Chinese division of the *kin* into 16 *riyo*; 1 *riyo* = 4 *bun* or *bu*, 1 *bu* = 4 *shu*. These weights are still used for medicines. Both these *kin* of 160 and 180 *momme* respectively, are called *dai-ikkin* or "large pound" according to the practice mentioned in the case of dry measure. They are distinguished from each other by the words *tô-me*, Chinese division, and *nihon-me* Japanese division, and when an article is being purchased by the pound, the vendor will sometimes inquire whether *tô-me* or *nihon-me* is meant. In addition to this, there is still the so called *yama-me*, for articles which come from the interior, and have to be transported a long distance to markets, such as tea, fragrant substances &c. This *kin* differs greatly, according to the distance of the place of production from the place of sale, and reaches as far as 210, 230 and even 250 *momme*.^{*} This uncertainty in the size of the pound also explains why in wholesale trade nothing is calculated in pounds; almost without exception the price of an article is given at so much per thousand *momme* (*ik-kwamme*) or per ten thousand *momme* (*jikkwamme*.)

Thus we have brought the history of Japanese weights and measures up to the present time; but it must not be supposed that the same measures are in use throughout the country. In different provinces the former Princes continued the old system or altered them, especially the dry measures, at their own pleasure. The present government therefore, considered it necessary, in August 1875, to issue a new standard ordinance which aimed at bringing the systems of weights and measures throughout the country into complete harmony. They established a standard office in every province, in which officials appointed by the central Government, tested and stamped all scales and measures. The weights and measures are those used in Tokio; but unfortunately the decree gives no official comparison of these with the weights and measures of foreign countries. Every standard office receives, at least, two sets of the requisite standard weights and measures, one for the office itself, and the other for the maker of the new ones. According to the requirements of the place, one shopkeeper or more in every town is authorized to sell them, and these privileged houses must exhibit a special signboard. As soon as the new measures required for a province are tested and stamped, they must be shown to the Government, who will then fix the term at which the sale is to begin. Within three hundred days after this date, all the old measures must be tested and stamped by the standard office, or changed for new ones; for breach of this regulation the measures will be confiscated and the owner punished.[†]

The testing of the weights and measures is done in a very simple manner. Measuring scales are tested with a pair of compasses; dry measures, which are all in the form of a box with a square bottom, and are almost wholly composed of wood, are measured by their length, breadth and thickness. This was formerly done by means of dried

millet seed; the normal measure, and that which was to be tested were filled by means of a funnel-shaped contrivance; the contents flattened, interchanged and weighed in a pair of scales. In dry measures, which are in the form of a rectangular box, it is noticeable that a flat piece of iron is placed diagonally across the top, the upper surface of which lies in the same plane as the four upper corners of the measure. This contrivance renders it easy on the one hand to grasp the measure, and on the other to flatten down the contents. In calculating the contents, the volume of this piece of iron is deducted, and hence it is that in the above mentioned official notification, its dimensions are exactly given.

At the end of this paper there is a short table for reducing Japanese weights and measures.

We now come to the system of Chinese weights and measures, which is very interesting. There is not the slightest doubt that it is more than 4,600 years old; and it is a highly remarkable circumstance that, quite irrespective of the fact that it is more scientific and exact, it possesses all the advantages for which the French metrical system is so much praised. In the first place, it starts from a basis supplied by nature, which at any rate is very different from the Meridian of the earth, which is the basis of the metrical system; secondly the decimal arrangement is almost consistently employed throughout; thirdly, linear and dry measure proceed directly from the same unit as the measure of weight, and, lastly, what the metrical system does not do, it regulates in the simplest manner the relations of musical notes, which latter form the starting point for the whole system of weights and measures. The following account of the origin of this system contains fact and fancy mingled, but it is easy to distinguish between^{*} them. In the reign of the Emperor Hoang-ti, called by the Japanese Kotei, who governed China in the twenty-seventh century before Christ, the scholar Lyng-lun (Kerin in Japanese) was commissioned to complete the musical system which had been discovered 250 years earlier, and particularly to lay down fixed rules for the making of the instruments. Naturally he had to commence with the bamboo, which had already been long used, to give the note for the other instruments; and he therefore betook himself to the province of Si-jung in the Northwest of China, where, on the Northern slope of a range of high mountains a species of bamboo grew, which, on account of its uniformity and its structure, which was neither too hard nor too soft, was exceedingly suitable for a wind instrument. He cut one off and tried it. Tradition says that it gave the same note as his own voice, when he was excited by no emotion; but the rippling of the sources of the Hoangho which were in the vicinity followed in the same tone. At the same time the fabulous bird Fung-Hiang (Hôwô in Japanese) flew to the place, accompanied by his mate. Both perched themselves on a neighbouring branch, and commenced a song, in the course of which each of the two birds gave six separate notes. These are the notes which are called the six male and six female tones, in the scale discovered by Lyng-lun, and which correspond to the ancient teaching of the male and female principles in nature. As a matter of course, the deepest of the male notes was the one the philosopher himself had already discovered. He now endeavoured to reproduce the other notes with the help of bamboo pipes, and succeeded. His task was now to lay down fixed rules as to the length of the pipes, so that thenceforth they could be easily constructed everywhere. For this reason, and because such a scale of notes depends upon slight differences of length, and there was

^{*} The information communicated to me by Mr. Ninagawa relative to the origin of the Chinese system of weights and measures coincides exactly with that contained in Vol. VI. p. 95 of the "Mémoires concernant les Chinois, par les Missionnaires de Péking, Paris 1780." Although it is by no means new, it seems to me sufficiently interesting to find a place here.

It seems moreover, that several scholars took part in this work. At page CXXX of the introduction to the work, we read, "Par ses ordres (of the Emperor Hoang-ti) Youshing fit une sphère et régla le calendrier et les saisons. Li-shen inventa la manière de compter; alors les poids et les balances furent réglés. Ling-lun fit la musique. Ling-lun prit un roseau dans une vallée, appelé *Huik-ki*, y fit des trous et souffla dedans, afin d'imiter les tons de la cloche. Il distingua les différents tons de la musique; six étaient appelés *Lü* et six *Lü*; avec ces tons il imitait le chant du Fong-hoang.

Le Ministre Yong-yuen fit 12 cloches, conformément aux 12 lunes; alors les 5 tons furent d'accord, les saisons furent déterminées."

^{*} Quite the same has been the case in Europe.

Zeller in his history of the people of Appenzell says, that from the 13th to the 15th century the measure of wine and fruit became smaller according to the distance or cost of transport from the place of growth to the place of destination, although the price remained the same. The diminishing of the quantity was in proportion to the cost of freight. He remarks here that this contrivance was very convenient for people who could not calculate.

S. L. Schmidt. Coins, Weights, Measures. Stuttgart. p. 5.

[†] Similar standard scales, weights, &c. can be bought now in Tokio.

scarcely at this time instruments to divide great lengths, he necessarily arrived at the notion of passing from the less to the greater, and of laying down an adequately small natural unit for his measurements or rules. But that could be nothing else than a grain of seed; and now the point was to get seeds of the greatest possible uniformity. He chose a sort of millet, called in Chinese *Shu* and in Japanese *Kuro-kibi* or black Sorgho (the botanical name of which is *Sorghum rubrum*) the seed of which is of a dark brown colour, and which is said to possess the advantage of greater hardness and uniformity than that of the grey and other kinds. The seed is pointed at the end, and from one point to the other the length is somewhat greater than in a direction at right angles to this. Lyng-lun now fixed the length of the pipe which gave the keynote at eighty-one grains of seed placed lengthwise in a row. But when the grains are placed breadthwise, exactly a hundred are required to give the same length.* Thus the double division of 9×9 and 10×10 was quite naturally arrived at. According to the dimension in question, it was called a musical or an ordinary foot, which latter was introduced with the decimal subdivision as a measure of length. The breadth of the grain of seed was equal to 1 *fen* (a line); 10 *fen*=1 *tsun* (inch); 10 *tsun*=1 *tshe* (foot); 10 *tshe*=1 *tschang*; 10 *tschang*=1 *ny*. Subsequently, the line was divided into tenths, hundredths, &c. up to ten millionths. Lyng-lun also laid down rules for the breadth, as well as for the length of the pipe; because, although the note is essentially dependent on the length, it is nevertheless necessary for its purity, that the pipe should be neither too broad nor too narrow. He therefore fixed the circumference inside at 9 grains arranged lengthwise.† With these dimensions, namely, a length of eighty-one grains, and an internal circumference of nine; the pipe which gives the keynote contains just 1,200 grains, and this volume was accordingly made the unit of dry measure. It is called *yo*; 2 *yo*=1 *ko*; 10 *ko*=1 *tscheng*; 10 *tscheng*=1 *ten*; 10 *ten*=1 *hu*.

Thus dry measure was obtained. But the twelve notes of the scale are all derived from the keynote, and are to a certain extent all comprehended in it. Hence, if the 1,200 grains contained in the scale, are divided among the twelve notes, it gives each 100, and the weight of these hundred grains was made by Lyng-lun the unit of weight. It was called a *tschu*; this again was naturally divided according to the decimal scale into 10 *lei*, and every *lei* again into 10 *tschu*, each of the latter representing the weight of one grain and taking the same name. We know that a similar unit of weight is used by many nations, especially by Asiatics, and also that it was used by the Greeks and Romans. Of course, we can regard the train of thought of the discoverer, as having proceeded in the opposite direction, namely that he started from the weight of a single grain of millet, and then took this tenfold and a hundred fold, and then gave to every note this number of a hundred grains. It is most probable, however, that some experiments as to the contents of his key-pipe led him to see that it contained 1,200 grains, and thence to the notion of deducing more exact numbers in the manner above stated.‡

* This is really the case, at least sufficiently accurately to lead to the number 100. It is not however meant to say that the Chinese, without this coincidence, would not have arrived at the decimal division, for already in Lyng-lun's time the number 10 played an important part in, and was the foundation of the system of reckoning.

† This at least is the dimension usually given by Chinese writers.

‡ In the "Memoires concernant les Chinois. Paris 1781. Part VI. p. 9, it is said that some writers are of opinion that already in the time of Hoang-ly some person (i. e. Rin or Lyng-lun) found the contents of the first pipe to be exactly 982.09275 cubic *pin*. But this seems hardly possible, if one examines this number more closely. Manifestly it is the contents of a reed 100 *pin* long, and one ninth of this in the circumference of the inside. In this case the exact calculation of the contents would give 982.438, which is very near the Chinese number. At the same time, it follows from the above estimate that the Chinese, in case the above supposition relative to the circumference of the inside is correct, took the proportion between the circumference of a circle and its diameter to be 3.1427. This coincides, however, so closely with the real proportion, 3.1415926, that we can hardly believe that it was known to the Chinese in Hoang-ly's time, that is in the 28th century before the Christian era.

The writer of this paper has not yet been able to ascertain in what manner the old Chinese expressed the relation between the circumference or area of a circle and its diameter. It is highly probable that above calculation is of comparatively modern origin. [See note at the end of this paper.]

From a hundred grains the weight multiplies, but not according to the decimal system; 6 *tschu* make 1 *tsu*; 4 *tsu* make 1 *leang*, and 16 *leang* make 1 *kin* or pound; so that a *leang* would correspond to our ounce.

This *leang* has also become the unit of the coinage, but at a much later period; and what in mercantile parlance is called a *tael*, is nothing else than an ounce or *leang* of silver. The subdivisions of the unit of value, and consequently of the unit of weight, were simultaneously fixed according to the decimal system, so that the same word was used for the weights as for the coinage, which represented the weight of silver. According to this division, the pound contains 120 *tsian* or *mace*, or Japanese *momme*, which was again subdivided into tenths, hundredths, thousandths &c.*

It has therefore been shown that in China, weights, measures, coinage and the tuning of musical instruments have been derived quite consistently from a constant unit supplied by nature herself; and that the essentials of this system are almost over 4,600 years old.

For that time, and for the result to be attained, this unit was chosen most judiciously; for accurate conceptions of mathematical exactness, however, its invariability is doubtful; and the method of starting from a very small unit and by the simple arrangement of grains of seed, in a row, to arrive at the larger units, is too much exposed to error. It is, therefore, not to be wondered at that the ancient Chinese measures, which are still maintained, do not exactly agree with each other. Neither has the length of the foot been always fixed by means of millet seed, because the Chinese have for a long time had real standard measures. Hence, (and this is the chief point) the unit system in their weights and measures and its connection with the music, has always been preserved intact, as will be shown farther on by a striking example. In order also to make the procedure of placing the grains of seed in a row as accurate as possible, a rule was made in the commencement, that the seeds should be sorted through sieves or by some other treatment, so that the larger and smaller ones should be excluded, and only those of medium size be used.

Later authors have naturally sought to restore the original key-note pipe of Lyng-lun, and have made various calculations, but notwithstanding some difference in the hypotheses, they are all based on a length of eighty-one lines or nine inches, and 1,200 as the contents, or on the condition that the circumference of the inside is one-ninth of the length. Similarly, all calculations, relative to the length of the twelve tone pipes, start from the same hypotheses. Frequently, also, a so called musical foot has been constructed. This is a hollow rod, with a square section, nine inches or eighty-one grains or lines in length, and divided on one inside into 9×9 and on the other into 10×10 parts. The key-note is given by blowing at one end when the other is closed. For musical purposes each of the nine inches is divided into nine lines; while the ordinary foot is divided into ten inches, and each of these into ten lines.

A work called *Dzuishi* (隋志) which appeared in the sixth century after Christ in the time of the Zui (Japanese pronunciation) dynasty, gives a comparison founded on drawings, the measures themselves, and statements in ancient works, of the foot scales used at various times with the *Yenken-shaku* (晉前尺) which was in use under the Kan (漢) dynasty, which had been in use for 2,060 years, but which is said to be identical with the measure used under the Shu (周) dynasty, and which was more than 3,000 years old; the latter is believed to have been fixed by means of the grains of seed. This *Yenken-shaku* is well known; it is 23 centimetres in length; and this corresponds well with the length of the millet seeds. The fifteen feet scales given in the above mentioned work deviate only a few lines from each other and from the *Yenken-shaku*; four of them however, are about 2 inches longer, and probably represented the "great foot," or *Dai-shaku*. Subse-

* It is known that the weight of a grain of seed was used by many nations of antiquity as the unit of a system of weights, especially by the Chaldeans, the Romans &c. A fuller comparison of these systems would certainly be of much interest; nevertheless it seems most probable that a system so perfect as the Chinese, developed with such consistent logic, and standing in the closest connection with other very ancient theories, is also an original discovery and consequently the oldest of all systems, and that it then, like so many other theories of the old Chinese, was propagated abroad.

quently, the scale was altered still more frequently, and it is therefore not of any special interest.

A *Yenkan-shaku*, over 2,000 years old, made of bronze with the maker's name on it, was recovered 189 years ago, in the neighbourhood of a temple in China; according to the Japanese pronunciation the place is called Kiyokufuyen (曲阜) in the province of Ro (魯國). The Emperor who reigned at the time this was made, i.e. 200 years before the birth of Christ, issued a decree ordering that all copper coins should have a diameter of one inch. There is a gold seal corresponding to this which was dug out of the ground in the province of Chikuzen in Japan forty-three years ago. The inscription informs us of the origin and the date, and by comparison with Chinese sources, it has been proved that this Emperor presented such a seal to a Japanese who visited China. It is exactly one inch square, that is, one-tenth of the above mentioned bronze foot.

A still more interesting piece of evidence which was recovered about 200 years ago is the celebrated standard measure or *Ka-riyo* (嘉量) of the Chinese *Omô* (王莽) a man who played a prominent part in his time as an able statesman and general. He set himself to the task of making a standard measure for posterity, corresponding to the ideas of unity in the Chinese system, which should fix at the same time, linear and dry measure, weight, and the tuning of musical instruments, and this labour, which was certainly a very arduous one for this period, he carried out in the following matter. He started from the hypothesis that the *yo*, or contents of the key-pipe, is not exactly 1,200 grains, but 810 cubic lines, that is, the pipe must have a length of 81 lines, and the inner section, which is circular in form, must have an area of 10 lines. Hence the next measure, the *ko*, must contain 1,620 cubic lines, and the greatest dry measure, the *hu*, a thousand times more, namely 1,620 cubic inches. His measure is a hollow bronze vessel, cylindrical in form, and bound with circular pieces of the same material; two smaller vessels are joined on it by projecting arms. It is provided with an inscription which describes the object of the vessel, its solid contents as above mentioned and its dimensions—the last in a peculiar way. It says that in the opening of the larger vessel a square of one foot each side will enter, but that a small space, which is given at .95 of a line, will be vacant between its corners and the circumference of the vessel. The diagonal of a square of one foot of 100 lines each side is 141.42 lines, to which must be added $2 \times .95$ of a line, the result being a diameter of 143.32 lines. The area of the surface cylinder is stated by the inscription to be 162 square inches; in reality it is 161.34. The writer cannot say by what formula the maker of this standard measure reckoned the contents; perhaps its diameter was only fixed by experiments, in which case this error was very possible, for in an exact cylindrical vessel the error would be less than three-tenths of a line, that is, three-twentieths of a line on each side. If the diameter was fixed by mere experiment, or corrected afterwards by comparison with the contents of a prismatic vessel, such a slight error is easily comprehensible from the simple circumstance that, with the means at one's disposal at that time, it was difficult to restore a cylindrical vessel which would be mathematically accurate.

In whatever manner the maker may have proceeded, it should be mentioned here, that if we employ the formula of the ancient Egyptians for the calculation of the contents of a circle, namely eight-ninths of the square of the diameter, we shall get the required area very nearly. This calculation would give us 162.296. The Chinese seem to have had a very similar formula.

As for the dimensions of the smaller vessels, these are derived in a manner mathematically correct from those of the larger one. First of all, the top of the latter is made to project an inch beyond the face of the cylinder, so that when the vessel is turned over, there is another with one tenth of its contents. The linear dimensions of the opening of the larger of the two side vessels is reduced to a fourth, and the depth to a fifth, hence the cubic measure is reduced to a hundredth of that of the large vessel. The sides of the inscribed square are two inches, and the space at the extremities of the diagonal is .19 of a line; the depth is 2.5 inches, so that the area of the smaller vessel must be $5 \times 5 \times \frac{1}{4} = 100$ times less than that of the great one. The linear dimensions of the other small vessel are

all one-tenth of those of the large vessel, and hence the area is one-thousandth of that of the latter. Finally at the bottom of the larger of the two attached vessels there is an empty space, which contains the side of a square of one inch, a space at the diagonals of .09 lines, a depth of five lines or half an inch, and consequently the 2,000th part of the area of the largest vessel, or 810 cubic lines.

Thus all the dry measures already mentioned are represented in this standard measure:— 1 *hu* = 10 *ten* = 100 *chong* = 1,000 *ko* = 2,000 *yo*; and at the same time linear measurements of a foot and an inch can be derived quite easily from the depth of the vessel.

But *Omô* was not satisfied with this; he wished to give the connection between the system of measures and music, as comprehensible an expression as possible. He fixed the thickness of the sides, the supporting rings and the mutual strengthening of the vessels in such a manner, that each of them when struck, gave the note *Osho* in different octaves. This note plays the same part in Chinese and Japanese music as our A of the tuning fork.

Lastly the total weight of the apparatus it stated in the inscription at 363 *leang*, or according to the Japanese pronunciation 363 *Riyo*.

Without going farther into modern Chinese weights and measures, which the writer cannot do at present, but which he may perhaps at another opportunity acquire for the collections of the Society, it seems suitable to give in conclusion some comparisons of Japanese weights and measures with those of the metrical system.

There has as yet been no officially recognized comparison made for linear measurements. It is however, already known that 33 Japanese inches make almost an exact metre, and the official recognition of this proportion has frequently been mooted. At any rate, the most careful comparison of two standard scales showed that this proportion is to be accepted as correct for the newly stamped scales. The comparison was as exact as a pair of compasses, and a metrical scale made for scientific purposes would admit of. Hence 1 metre = 33 Japanese inches, and one Japanese foot (10 inches) = 30303 . . . of a metre. In the case of dry measure, the official standard decree of August 1875 fixed the *Sho* at 64,827 cubic lines; hence according to the above proportions 1 *Sho* = 1,803,907 Litres.

In the case of weights, there is an official statement in the fifth volume of the *K'wan-to-hike* (官途筆記) of 1872 (Vademecum for officials), according to which 1 *Momme* = 3.756521 grammes, and consequently one Japanese pound or *Kin* = 160 *Me* = 601.04336 grammes.

From this basis the following comparison can be adduced:—

ORDINARY LINEAR MEASURE.

1 *Kane-shaku* = 10 *Sun* = 100 *Bu* = 1,000 *Rin*; = 10,000 *Mo*.
1 *kane-shaku* (foot) = .30303 metres;
1 metre = 3ft. 3in. Japanese.

CLOTH MEASURE.

1 *kiijira-shaku* = $1\frac{1}{2}$ *Kane-shaku* = .3787878 metres.

ROAD MEASURE.

1 *ri* = 36 *cho* = 2,160 *ken* = 12,960 *shaku* = 3,927.27 metres.

28.28 *ri* make one degree at the Equator. The *ri*, however, is not of the same length in all places; but the above estimate is that used in topographical surveys.

1 German geographical mile = 1.886 *ri*.

SQUARE MEASURE.

1 *tsubo* = 36 square *shaku* = 3.305785 square metres.
300 *tsubo* = 1 *tan* = 991.7335 square metres.
10 *tan* = 1 *cho* = 9917.335 square metres, or nearly one Hectare (more exactly 120 *cho* = 119 hectares).
1 Acre = 30.25 *tsubo*.
1 Hectare = 3,025 *tsubo*.

DRY MEASURE.

1 *koku* = 10 *to* = 1000 *go* = 10,000 *yaku* = 180,3907 litres.
1 Hectolitre = .55435 *koku* = 55.435 *sho*.

WEIGHT.

1 *momme* = 3.756521 grammes.
1 *kin* = 601.04336 grammes.
1 gramme = 266.204 *momme*.
1 pound (or $\frac{1}{2}$ kilo) = 133.1020 *momme*.

NOTE.

[Referring to the calculation of the circumference of a circle, it should be noticed, that in ancient Chinese works especially in the *kiu-chang-shiu shin* which was published about a century before Christ, but which is said to have been compiled from still older works, the circumference of a circle is taken at three times the diameter; but it says expressly that this is only approximately correct. In a work of the end of the sixth century, the *Mei-su* the proportion is taken at 22 to 7, and in a still earlier book at 157 to 50. The estimate of 22 to 7, corresponds very accurately with the calculation in the previous note; but none of the above estimates correspond with the statements of Omô about his standard measures. It is therefore very probable that he fixed the dimensions in question by experiment.

The following is a translation of the inscription on the standard measure, for which we have to thank Mr. Kempermann, the Secretary of the German Legation in Japan. For the better understanding thereof, it may be remarked here that the Chinese Emperors generally chose one of the five elements for an emblem, in virtue of which they reigned. Omô, who usurped the throne for some years chose (following the example of Hoang-ti, called by the Japanese Ko-tei or Ko) the Earth; while the dynasty Kan which was supplanted by him for a time, had Fire for its emblem. During his reign he called the country Shin, made some changes in the calendar, by which he altered the new year's day, and above all regulated the system of weights and measures. [The translation of the inscription, which latter is written in verse, runs as follows:—]

"The virtue of my forefather, the Emperor Ko, overran the land of Gu, and the virtue of the Emperor Gu filled the whole land of Shin. This was in the year of the constellations Tai-ryo (great-bridge) and Ryo (Dragon). Then I accomplished the command of Heaven, and received (the Empire over) men; and I attained, through the power of the Earth, to the true title, and to the Imperial dignity. The month of the bull I made the first month. My life was long, flourishing, and highly esteemed. I gave precision (throughout the land) to measures of length and quantity, and also to weight; and in this I followed the ideas of earlier men. This was in the year of the constellations Ryo and Jitsiu (the year following that above mentioned). Then for the first time I promulgated this decree. In all the provinces, people will observe them for ever, and my descendants will hand them down for ten thousand times ten thousand years."

CORRESPONDENCE.

We do not hold ourselves responsible for the opinions or sentiments of Correspondents. No notice can be taken of anonymous letters; whatever is intended for insertion under this heading must be authenticated by the name and address of the writer; not necessarily for publication, but as a guarantee of good faith.

To the Editor of the *Japan Times*.

Dear Sir,

Your modesty thinks less of the assistance of your paper than I do, and I can as little agree with you in calling the influence of the *Japan Times* infinitesimal "as in some other points in your article No. II on "Fire Insurance in Japan."

There are five points of dissent between you and myself, three of which originate from principles and two from misunderstandings.

You are opposed to my propositions on the ground of principle in three points:

- 1.—The institution of insurance of buildings *at present*.
- 2.—Against making it *compulsory*.
- 3.—Against making it *governmental*—as you write: "Better to accumulate and publish the statistics and then leave the whole business to the growing common-sense and appreciation of foreign example."

I have had by your kindness such ample opportunity of stating in your own paper my views on the two last points, that your readers may judge for themselves, whether your reasons as stated in your critique, or mine as given in my paper, are the more convincing. I may therefore confine myself to the first point, namely whether it is advisable to institute *at present* the insurance of buildings in Japan, although we have only the statistics of two years at hand.

I am glad to see that all the facts which I have quoted seem to have succeeded in establishing, even in a sharp critical mind, a certain belief in the general correctness of my calculations. You write: "We do not so much quarrel with the amount of his proposed house-tax—one per cent—because though . . . in England, one-eighth per cent is about the average premium, still, for the present in Japan, . . . the risk of fire is not overestimated as being eight times as great as in England, especially when . . . earthquakes, . . . inundations . . . and a few trifles of typhoons are thrown into the bargain."

Notwithstanding this friendly recognition, which I receive with thanks, let us for a moment consider the average premium at which I have arrived as too great, and then as too small, and then let us enquire: "can the plan be carried out *at present*?"

If the premium be too high, it is evident that the insurer, be it a private company, or the government, would gain largely, so far as the premium is concerned, and that would certainly be no reason for withholding the benefit of insurance from the country.

If the premium, however, be too small, we must distinguish between the case in which the government is the insurer, and that in which the insurance is effected by a private company. It is evident that when the premium is too small, private companies must become bankrupt, and therefore matters would not yet be ripe for such private enterprise. It is otherwise, however, when the government is the insurer. If the estimates on which the house-tax is based be too low, then the government would for some years have to advance a sum to all the insured; the credit of the country would for a time be put under a contribution for the benefit of all the proprietors of house property in the country. Meantime more complete statistics would enable it to rectify the error, and to levy an adequate house-tax, and even one sufficient to counterbalance the lowness of the previous estimate.

You, in recommending private companies as the insurers, say with perfect justice: "wait for the observations of other years." But I, in recommending the government as insurers am justified in saying to it. "Introduce it at once, the subject is so important for the welfare of the land, that every month's and every year's delay is much to be deprecated. You must permit me to leave out of the question at present the compromise between your views and my own, viz. a private Company with the guarantee of the government. This would lead us into a too lengthy discussion.

After thus touching our differences on matters of principle I may now refer to those misunderstandings which are occasioned by my views not having been expressed sufficiently clearly and explicitly:

1.—You call it a "grievous mistake to propose to tax every house alike." I may call your attention to the fact that my papers deals with the *average* destruction, the *average* expenses and the *average* premium, just as you yourself speak of the average premium of England, where there are many classes of buildings for purposes of insurance. I may mention that I have by no means tried to hide the fact of the difference between the amount of destruction wrought by fire in towns and in the country, as I have myself disinterred from the Norwegian statistics the fact that towns built of wood suffer more from fire than wooden villages. You are quite right in regarding as important the question which you put to me as to what percentage of fires occur in towns and what in the country. You request me also very properly to apportion the risks and the premiums. I shall be very glad if a second paper, which I have for some time been preparing for the German Asiatic Society, and in which I am giving some statistics to the point, will satisfy your desire. But I contend that this apportionment of the risks and of the premiums is not at all necessary and that without it injustice would occur "*which no correlative or consequent advantages to trade or credit could out-weigh.*" The highest principle of national economy is the greatest happiness of the greatest number and not the highest justice to each individual or class of individuals.

2.—You call it another fatal objection to my proposals that I concern myself with houses only and not at all with the property stored within them. You expect that the insurances effected on goods, furniture and other property exceed those on the mere buildings which contain them. But a few statistics exist of the insurance of movables and immovables for the same region, which render a comparison possible. In Germany I take, with other statistical writers, the fire insu-

rance on movables to be only one-seventh of that on immovables. For instance there were in December, 1870.

Movables. Immovables.
Thaler 56,853,425 354,619,060 insd in the Rhine-province and
Thaler 37,695,620 227,367,450 insd in the Westphalia.*

In Japan I think the proportion would be much less than one-seventh, because the amount of Japanese movable property is still more unimportant. It may perhaps be a defect in my paper that it confines itself to the statistics of the destruction of houses, but I did not think it wise to attempt the impossible task of giving an independent estimate of the destruction of movable property here by fires and by other destructive agencies, and of the relation of the movable property destroyed to all the other movable property of Japan. I thought it best to establish one point clear and certain,—say the average destruction of houses—I thought that this would guide us by analogy to a tolerably correct estimate of the premium for insurance on movables. But, moreover, how could a “fatal objection” to my proposals for the institution of a system of insurance on buildings be at any time derived from the entire absence of any estimate of the average premium on movable property?—I think you will readily acknowledge that this expression is a *lapsus calami*, as I readily acknowledge that it would have been better if, in the introduction and at the conclusion of my paper, I had expressed more explicitly and more strongly than I have done, the hope that once the insurance of buildings was established, that on machinery and such movables as wares, furniture etc. would quickly follow. I may take this opportunity of answering your inquiry and of stating my opinion:—

1.—That insurance on movables should never be made obligatory.

2.—That the government, with certain necessary restrictions by normal statutes and a certain control against over-insurance should let this field free to private enterprise.

3.—That it would depend entirely upon the organisation and the working of the supposed government insurance of buildings, and upon the working of private insurance on movables, whether the government should at any time also enter the same field. It would therefore be premature to give a decided opinion at present on this point.

You object that by making government the general insurer on buildings only, and compelling the people to insure their buildings in the government office, there would be taken away from voluntary enterprise a large part of the inducements to start private insurance offices. I take a contrary view; government, in making the insurance of seven millions of houses compulsory, would make people acquainted as widely as possible with the idea of insurance, at present totally new to the Japanese mind. It would thereby give the highest assistance and promotion to insurance in general, not only to the insurance of movables against fire or earthquake, but also to other sorts of insurance, for instance, insurance *in transitu* (*Transport-Versicherung*), Marine-insurance, insurance on cattle, insurance of crops against inundations and storms, and, last though not least, to life-insurance. Hence the government, in making the insurance of buildings governmental and compulsory, would really *open* thereby an immense field for private enterprise.

I cannot therefore relinquish the hope that notwithstanding your own declaration, I may nevertheless have your valuable support, as well as that of the government and the people; and I do not expect or fear, as you do, that such a portion of the seven millions of Japanese houses as would change in any appreciable manner our present statistics of Japanese fires will be furnished with chimneys, open fire places, foreign furniture and curtains—complete.

Believe me, Dear Sir,

Yours very truly,

P. MAYET.

Tokio, May 22nd, 1878.

To the Editor of the *Japan Times*.

Sis,

A copy of the “Hongkong Daily Press” for May 3rd was sent to me a few days ago which contained a statement purporting to be founded upon a paragraph in your

* Vide G. F. Kolb *Handbuch der vergleichenden Statistik* 7te Aufl. Leipzig 1875.

columns to the effect that I had purchased the “Shanghai Courier” for Tls. 12,000, in Chinese interests. I therefore wish to inform you that that statement is wholly incorrect. The paper has not been purchased at all. It has been leased, but not to Chinese, nor in the interests of Chinese and no Chinese has any interest in, or connection with the paper of any sort, or kind, either direct, or indirect.

I am, Sir,

Your obedient Servant,

W. V. DRUMMOND.

Shanghai, 16th May, 1878.

[We hasten to insert the above. Mr. Drummond will soon find, if he does not know already, how difficult, how impossible, it is—for the conductor of a newspaper to sift thoroughly every piece of information given to him, and how much weight he has to give to the character, antecedents, known good faith and accepted accuracy of his informant.

In this instance, we had all these guarantees; we regret to find that still the information given to us has to suffer our present correspondent's contradiction. An intelligently conducted and well-written journal, such as the “Shanghai Courier” will be under Mr. Drummond's control, advocating specially Chinese interests—freely and fairly, not with slavish adulation of the Government or of every petty official—is, we think, a desideratum, and we are sorry to be told that we have been misinformed.

Ed. J. T.]

NOTES AND QUERIES.

QUERIES.

Qy. 6. Can any of your readers inform me whether there are any, and if so, what books on Japanese surgery, or midwifery, as practised before the coming of the Dutch and Portuguese? (*Unanswered.*) Z.

Qy. 8. Mr. Bramsen's interesting note on the relative values of coins in your issue of February 23th, leads me to think that he or some one else may possibly be good enough to clear up a few points which have frequently occurred to me:—

1.—Can any one say when, and under what circumstances, paper money was first issued in Japan? “Shosei” in your issue of March 9th gave a most interesting account of the *Han* paper money; and perhaps if there were a general issue before that, some other student may be able to do the same for it.

3.—Can any account be got of the regulations (if any) which governed coining under the feudal system? For instance, under what circumstances was permission granted to certain individuals to strike coins? This seems to have been done at various parts of the country, thus we have Musashi Ichibu, Suruga Koban, &c.

(*Unanswered.*)

X.

Qy. 9. I want information as to the locality of the signature of the original Treaty with Japan by Commodore Perry. Treaty Point, a mile or so away from the town indicates the spot: but was the treaty signed there in the Temple at Homoko, near which the butcheries now stand; or was it under a group of trees which stood on the site of the present British Consulate? I have heard both places assigned as the scene of the transaction.

(*Answered below.*)

B. A.

Qy. 10. Can any of your medical or other readers inform me of the recent existence of cases of poisoning resulting from the use of bread made from impure wheat; the symptoms being those described in works on Medical Jurisprudence, as arising from the presence of the *Lolium temulentum* or Darnel grass (or other poisonous *gramineae*) viz; Gastro intestinal derangement, narcotism, vertigo and convulsions.

(*Unanswered.*)

R. N.

Qy. 11. Many of your readers, when walking towards the new cemetery, must have remarked the *tumuli*, about twelve in number, which dot the table land which lies above Ota on the one side, and the hill of Tobe on the other. These *tumuli* are religiously preserved from the spoiling of the farmer, and must have some history; are they the burying-places of heroes fallen in some old quarrel? Can any of your readers enlighten me?

(*Unanswered.*)

T.

Qy. 12. In Jules Verne's work, entitled "Michael Strogoff, the Courier of the Czar," occurs a paragraph which touches upon the disposal of political exiles in Siberia. Speaking of their concentration at Irkutsk, during one of the Tartar invasions, he says "some are doctors, others professors, either at the Japanese school or at the School of Navigation." One does not of course, expect absolute accuracy in a novel, but is our ingenious author not a little adrift here! I shall however be glad to know if such an institution really exists.

(First time of asking.)

M.

NOTE.

NOTE TO QY. 9. B. A. will find a full account of the signature of Commodore Perry's Treaty in the large illustrated quarto published by the American Government after the Commodore's return from his cruise; together with an illustration representing his landing and the temporary building erected for the purpose of receiving him and interchanging the signatures. This was from a drawing made on the spot by an artist who accompanied the expedition. The place was where the British Consulate now stands, in front of a temple which then existed. Under a large tree there, was a small *miya*, or shrine, which was removed to make way for the building. The tree, a very handsome one, will be remembered by many of our older residents. Treaty Point was simply named in record of the event of the signature, and had no more to do with the document than had Daniel Webster with the island to which his name was given at the same time. H.

YOKOHAMA: SATURDAY, MAY 18, 1878.

NOTES OF THE WEEK.

Friday Evening, May 24th 1878.

GOD SAVE THE QUEEN! The expression of our hope that Her Gracious Majesty may long be spared to her loyal people must take precedence of all else, this twenty fourth of May. Her reign has been exceeded in length by those of but three of her long ancestral line, Henry III's, Elizabeth's, and George III's; in glory—the best glory, the moral and material advancement of her people—surpassed by none. Now, after forty-one eventful years of almost unchecquered prosperity and triumph,—for danger and difficulty have only presented themselves to be splendidly overcome—we appear to be on the point of engaging in a struggle with Russia only equalled in magnitude in English history by the death-grapple with Spain under Elizabeth, and the long, hard fight with Napoleon under the Georges. That the issue for England will be the same, no Englishman doubts, with or without allies.

The news received from home get every day more and more perplexing, but always seeming to indicate that we are drifting nearer and nearer to war. It is one of the counterbalancing disadvantages to the blessings enjoyed by a free people, living under constitutional and parliamentary government, that in such a crisis at this, it is impossible to act with either the secrecy or the decision which give so much advantage in striking the first blow in war. There despotism has all the pull. The Queen and Lord Beaconsfield, if untrammelled by constitutional checks—would, the best private authority informs us, having long ago arrived at a solution of the difficulty. But with a divided Cabinet, with an opposition led by a man who once had been a great statesman, led factiously, and in a manner calculated more than any other to hamper government—not using legitimate Parliamentary weapons, but those most easily made mischievous ones of public meetings and the press; it has been impossible for the great Conservative Minister to carry out a policy to the full, which would have replaced England in the position she occupied in Europe after the Battle of Waterloo and the Peace of 1816. But many of these difficulties have now been cleared out of Lord Beaconsfield's path, and we have at last a fair prospect that he will be able to give to the nation the blessing of an honourable peace, or lead it to the triumphs of a no less honourable war.

For obvious reasons, we do not often give utterance to our

opinions on European events or politics: we prefer to speak vicariously, by extracts from the better-informed London press: but on such an anniversary as this, we must be allowed a feeble crow and a trifling flutter of our patriotic wings. And as "Vanity Fair" is a paper not much taken in here, and which has recently shown itself to have as exclusive and trustworthy sources of information as used to be possessed by "The Owl," we have quoted from it, this week, a criticism of the Treaty of San Stefano and a review of the political situation, which we recommend our clients to read. Telegrams subsequent to the signature of the Treaty have not shown us any material change in the position of affairs, and the extract possesses more interest, therefore, than such padding can usually boast. To us, it appears the best and clearest view of the situation yet given to us by the English Press.

The *Tanais*, with the Marseilles mail of the 11th of April, arrived on Monday last, and the *City of Tokio* on Tuesday, 19 days out from San Francisco. After two postponements on account of the weather, the *Oceanic* finally departed for San Francisco at 4 P.M. on Monday afternoon last. The *Orissa* with the homeward mail due in London July 15th, was despatched on Wednesday morning last at daylight. The *City of Peking*, which our readers will remember, met with an accident to her machinery, will be delayed in Hongkong longer than was expected, and arrangements have consequently been made, so that the O. & O. steamer *Belgic* shall carry the next American mail, leaving here on or about June 5th, while the *City of Peking* will follow on in about a fortnight, taking the schedule time of the *Belgic*. These two opposition companies are much too friendly and obliging to one another; if they would kindly fall out, perhaps a trip to San Francisco and back as a summer holiday, might come within the means of a good many in Yokohama. The next home mail is the *Tûre*, leaving here on the 29th instant, her mail is due in London July 22nd. There is no other mail news of importance beyond the usual movements of the coast steamers.

An accident happened this afternoon which might have been serious: one of a class which we wonder is not more often recorded. At 4 P.M., as the *Tokio Maru* was on the point of departure a Japanese boat conveyed a passenger to the ship, and got too near to the wheel. A half turn thereof sucked in the boat, smashed its bow and upset man and boy into the water. The boy foolishly clung to one of the paddles, the wheel went on moving, and the poor little fellow disappeared up into the paddle box. Happily there was room for the shrimp between the wheel and the box, so that when the wheel swung back, he came down boy—not pulp, and swam off, more frightened than hurt.

On Wednesday morning; the *Kon-go-Kan*, Japanese corvette, which had been down to Yokoska to be put in order after her voyage out, came quietly slipping up the bay to her former anchorage. Only she turned out to be, not the *Kon-go-Kan*, but her sister ship the *Hi-yei-Kan*, from Milford Haven on the 23rd March, a very good run of sixty days. She, too, is from the designs of Mr. Reed, and is as beautiful a model, and in all respects as successful a product of naval architectural and engineering skill as the *Kon-go*. She was built, we are told, at Milford Haven, and by a young Company which does not seem to yet possess a dock or slip, for they built her on a mud flat. They have certainly turned out a splendid vessel. She has a four inch streak of armour plate, 100 ft. long and 3 ft. 6 in. wide, protecting her vital parts at the water line, her engines, magazines, shell room, &c., being all below this. Iron water-tight bulk heads running the whole way up to her upper deck serve materially to strengthen her battery platform, and divide her into a number of water-tight compartments. She has six boilers and compound engines with surface condensers, and all the latest improvements. It says a great deal for the makers of her engines that, though she came away without a trial trip, they have worked like clock work the whole way out. Her full speed is sixteen knots, but of course she came out under easy steam, and with four boilers only burnt twenty tons of coal a day. She steers beautifully and is easy in a sea-way, her head and stern being lightened, when not prepared for action, by an arrangement of her armament, by virtue of which her two forward and one after gun—her heaviest—are withdrawn inwards toward the centre of the vessel. Her battery is the same as the other vessel, six Krupp guns, three on a side, of fifteen centimetres, two forward and one aft, each of seventeen centimetres. She is barque rigged and is, we are told, a handy boat under sail; while her accommodations for about 180 officers and men appear superior to those in most of H. B. M. ships. We believe she cost about £120,000. If so, she is a cheap vessel; but the money had much better have been spent in making roads.

A considerable fire, by the way, occurred at Yokoska one day this week, but happily the valuable dockyard escaped without damage. We hear that the Mitsubishi Company have for the

present given up their idea of a dock for themselves. Also that, in spite of their terrible losses lately reported, they have been able to subscribe half-a-million to the National Loan.

Riots and rumours of riots continue to keep the Government uncomfortable and find food for the native press. The disturbance at Kagoshima appears however, to have been of no great importance or significance, and was caused by the want of proper arrangements being made on the occasion of a body of some three thousand *samurai* receiving their pension-pay. All crowding together to get to the pay place, they of course came into collision with the police, who are naturally not popular, over-bore them and 'made hay' in the office. The officials and police having all fled, the *shizoku* quieted down and, after lunching quietly on the scene of action, retired in good order.

A much more serious disturbance is reported from Formosa, where the aborigines have risen against the Chinese, and have killed and eaten a number of them. Japan would have kept better order in Eastern Formosa, we are inclined to believe, than China is ever likely to do. The famine oppresses this unhappy country as heavily as ever, and it is impossible to avoid the conviction that the dissolution of the Empire is at hand.

'Happy the nation without a history'—happy the community without Law Reports! We have nothing yet of intelligence from our local Courts to make up the next number of our series, but expect to have in a week or two. Meanwhile, a prisoner and a reporter have both been making little mistakes. The prisoner escaped, and as escaping in Japan merely means twenty-four hours holiday, or less, it is hardly necessary to say that he was quickly caught, and got three months' more imprisonment added to his sentence. Considering that 'hard labour' means, we believe, keeping the grounds of the Consulate in order—we remember distinctly, some years ago, getting much botanical information from a 'hard labour' prisoner who was picking caterpillars off the Consular cabbages,—it is odd that a man should care to run away: with the certainty of getting an addition to his sentence on his return. Perhaps the man Cannon is fond of gardening, and wanted to ensure, by lengthening his term of imprisonment, that he should see, at all events, the fruition of what he, may be, sowed last week.

The member of our own guild referred to, got into trouble in a peculiarly simple way, and has come out of it excellently well—let us hope, from the Judge's sympathy with the Fourth Estate. This gentleman picked up a document just outside the Court door—which, considering that he had that morning been reporting the case, he ought certainly to have guessed was a document necessary to it and technically the property of the Court, for the time being. But instead of handing it to the Register, he innocently gave it to one of the parties to the cause, whose name it bore. Whence arose confusion. This happened last February, it appears, and upon the document at last turning up, the Judge sent for the Reporter and 'wiggled' him. So far, so good. But this does not satisfy our friend of the press, who incontinently rushes into point by favour of our daily contemporary the *Herald*,—who, with a saturnine humour very creditable to it, admitted the poor man's letter—and asks, in a charmingly simple manner:—"By what authority does Mr. Wilkinson presume to publicly admonish any person before a charge is laid against him?" We have not heard of his having, since, been fined for contempt of Court.

The *Choya Shimbu*, by the way, is only temporarily suspended, we hear, and its re-issue will be permitted in a few days. This is well: repression of legitimate expression of opinion is a mistake, and though the alleged cause of its stoppage was its publication of the letter of the assassins of Okubo, it is well known that the paper, being in opposition, has long been obnoxious to the government.

We are sorry to have to note an accident on the railway. A stoker was killed on Sunday last, falling from the engine, which was in motion, while he was engaged in oiling some of the parts. She went over his head and killed him instantly. Beyond this, and a slight fight between some Russian and English sailors of no great moment, this is about all we have to report under the head of accidents and offences.

Dave Carson's company left us for Shanghai this afternoon. We sincerely hope that these clever artists will have more success than they had here. Musicians quite above the average of such *troupes* and with a good deal of undeniable dramatic ability, with a quite remarkable and precocious child who will grow into a successful burlesque actress—and with the Manager, a 'host in himself' and at the top of his profession as a humourist;—still it cannot be denied—Dave Carson's Minstrels this time, failed to draw.

Hard times and general impecuniosity have to be blamed for this failure in part: then November and December are better months than May for such amusements; and finally, we have had rather a plethora of amusement of late. Mr. Carson's good humour under his disappointment did him credit and we cordially wish him, in the words of his benefit programme:—"Better luck next time!"

Yokohama, 22nd May, 1878.

[We are requested to state that this list will close for Yokohama and Yedo on Monday Evening next. For the out ports it will be kept open a month longer.]

THE JAPANESE PRESS.

THE SILKWORM EGG NOTIFICATION.

(From the 'Chingai Bukka Shimpō'.)

THE Government has, in its Notification No. 10, cancelled the Notifications, No. 19 of the 2nd month of the 7th year of Meiji on the Regulations for Silkworm egg cards

No. 47 of the 3rd. month of the 8th year, and No. 39 of the 4th month of the 10th year on the alterations in the regulations; No. 32 of the 2nd. month of the 8th year, on Regulations for Companies for producing Silkworms' eggs and for the Silkworm egg business Association; No. 65 of the 4th month of the same year, on the additions to the Regulations, and No. 42 of the 5th month of the 10th year on the production of first Summer Silkworms' eggs. By the effect of this Notification, silkworm eggs have escaped the control exercised over them for many years and have reached the point of free production and free trade, that is to say; one may now use any kind of paper for the egg cards; is not obliged to join the Association; may use purchased mulberry leaves; may increase the amount of production; need not make distinction between home and foreign sales; need not purchase the expensive Government paper for cards; and has no tax to pay for stamps. Free production being now allowed, there may be some among the Silkworm egg producers, who greatly rejoice at it and others who greatly regret it. To explain more fully, these are as follows:—The producers of Jōshiu, Bushiu, Iwashiro, Akita, &c. who have at present a good reputation and value for their silk in foreign markets, will greatly rejoice at the Notification; those of Yonesawa, Shinshiu, Koshiu, Gōshiu and others who had lost the reputation and value of their silk, but who have hitherto been able to maintain business in silkworms' eggs, only by the existence of the limitation system, will doubtless greatly regret its publication. The effect of this Notification is, we may say, quite a revolution for the parties concerned in this business; and also it has an important bearing upon the general silk trade; and the action of the Government is in our opinion, really proper and praiseworthy under the present circumstances. It may, however, be argued:—is it not better to prohibit the export of our silkworm eggs, so as not to let the same quality of raw silk as ours be manufactured in Europe? Indeed this is often argued by foreign newspaper editors and is a very useful suggestion, but although we have the same object in our mind also, this is a matter impracticable until after the treaties with Foreign Powers shall have been revised. Further, if our Government gets the right to prohibit export, still it must not be done heedlessly, because when prohibiting the export of eggs—we should first carefully consider the character of the silks of Italy and France and ascertain whether or not they, in the event of our stopping the export of eggs, would be able to produce raw silk of the same quality as ourselves? Should we stop the export, they would doubtless, strive to produce such silks as are fit to take the place of ours and if they succeed in doing it, our having stopped the export would result, not only in waste of trouble, but in loss to the country of some ten thousands of *yen* which would be gained if the export were allowed to go on. We therefore declare the free production and free trade to be the proper action under present circumstances.

The reason we praise this Notification and take the side of free production and free trade, is because we anticipate that the silk business will become greatly flourishing in future. Producers in Jōshiu, Bushiu, Iwashiro, Akita, &c. who get good prices and have a great foreign demand for the silkworm eggs, have been hitherto, not only on account of the existence of the limitation system (as they have been allowed to produce only a quantity in equal proportion to others) unable to produce to their satisfaction, but although they have had a surplus of mulberry gardens, have been unable to make use of such. On the other hand, those in Yonesawa and other places, whose eggs were not liked by foreigners, through the existence of the limitation system which put a limit to the production of others, have been able, though at a low price, to dispose of their own. Thus silk producers have all hitherto been doing business in the old way; but now since their own free production and free trade is allowed, those in Jōshiu, Bushiu and others who have hitherto been obliged to limit their production, will increase it to the fullest extent and as future transactions are important, will export only eggs of the best quality. While on the other hand, silk growers in Yonesawa, Shinshiu and others, will—since if they bring eggs to Yokohama, they will not be purchased by foreigners,—give up the production of eggs altogether, to devote themselves entirely to the manufacture of raw silk. That foreigners like those of Jōshiu, Bushiu and other

districts; and dislike those of Yonesawa &c., may in some measure be on account of the quality, but is mostly on account of their suitability to foreign climates. This will be well understood from the fact that the raw silk of Shinshiu is really superior in quality to that of Akita. We therefore conclude, that if the silk egg producers of Yonesawa, Shinshiu and others, with the energy which they have hitherto shewn in the production of silk worm eggs, will now produce raw silk, and those of Jōshiu, Bushiu and other places, will strive to increase the production of silk worm eggs so as to meet the foreign demand, both the silk worm eggs and the raw silk business will greatly advance in prosperity. This is what we expect in the future. In addition, there is a point for which we cannot but praise the Notification which allowed free production and free trade in silk worm eggs. Although the Government's interference with the production or trade may be temporarily advantageous, it would finally prove to be no better than leaving it free and simply protecting the convenience of the people. Indeed the Government has more than once interfered with this business of silk worm eggs, in order to maintain their normal value, but we have never seen any good effect of its interference. This is sufficient to prove that in all things the advantage derived from the Government's interference is not more than that of allowing trade to be free. Undoubtedly, Government, seeing all this, has issued this Notification and therefore it cannot be an error for us to say, that the action of our Government is now directed towards "Freedom," at which we are extremely pleased.

MANUFACTURES IN JAPAN.

(From the 'Chingai Bakka Shimpo'.)

MANUFACTURING art in our country has gradually advanced, and we can now manufacture numerous things in imitation of foreign make; of which the principal and best known are boots, stockings, knitted work, under-shirts, matches, paper, soap, paste-board, silk for umbrellas, pencils, slates, bags, pocket-books, cigar-cases, hats, sticks, cigarettes and cigars, cakes, taffachellas, cotton-cloth, flannel, silk-handkerchiefs, beer, wine, perfumed water, stoves, glass-ware, furniture, &c. And although some of these are not yet as good as those of foreign make, some, such as boots, and matches, are greatly improved in quality, and not only are they not inferior for practical use, but their prices are cheap and yet very profitable to the makers. This is indeed a subject for congratulation. But that the productions of foreign countries are much more appreciated than those of their native make, seems to be a general national feeling all over the world. Actually in Europe too. For instance, people in Spain and Portugal are so bound by this custom, that they only wear hats, things made in Paris. Indeed, unless they wear hats, boots, &c., with the Paris marks on, they consider themselves somewhat disgraced. Such being the custom, the products of these countries are, in order to get them purchased by the natives, exported to France and after receiving the Paris marks, are then again imported, thus paying double customs duties and consequently making the prices dearer. On the other hand, the people, not knowing that they are the products of their own country, purchase them simply by the marks and are very proud of them. In our country, the custom of appreciating foreign things (although our boots, umbrellas &c. are good in quality and cheap in price, they are not favoured) being still more prevalent; there are not a few who purchase things at an unprofitably high price simply for their "foreign make" and are very proud of them. But we have heard from a foreigner who tested the Japanese and Foreign silk for umbrellas, that he found that the latter has worn out in one year, whilst the former lasted for two years, and that he, ever since that time, has employed Japanese silk only. Japanese silk-cloth contains a greater quantity of silk than it appears to have, whilst the foreign contains but very little: the latter, however, being made so bright in colour, and heavy in weight by chemical means, although it appears to be thicker than the Japanese, only lasts a much shorter time. How is it that our countrymen, without making such observations, purchase things at a high price simply because they are foreign make? Although these may seem like trifling things, they are not so; for this habit prevents, in a great measure, the advancement of

manufacturing arts. In Spain and Portugal, although the people are not unskilful in manufacturing arts, their advance having been prevented by this custom, the prosperity of the country is far from being in a hopeful state, but is gradually drooping towards decay. Is this not sad? In a country like ours, where the manufacturing art is yet green, we must strive to assist its advancement. Thus arguing, readers might take us to be of those who are in favour of decreasing or resisting imports. But we are certainly not of those who form such an obstinate opinion, and we only wish to explain the means of improving manufacturing arts. We also do not recommend to employ the things of our own make notwithstanding the quality or price, but we only wish to say that those things which are almost equal to foreign ones, in quality and price, and not inferior in actual use, should be used as much as possible and assistance be given in this way to the advancement of manufactures in the country. If the higher classes of our countrymen, seeing into this, would direct their attention towards home made things and employ them, as the things liked by higher classes are also liked by the lower, the whole community would take the same course. This is the best and easiest way for improving manufactures and Government notifications or protection can do no better than this.

ENGLAND'S DISTRESS IS INDIA'S OPPORTUNITY.

(From the *Choya Shimbun*.)

FROM what recent telegrams report, a declaration of war between Russia and England seems to be close at hand. At this, I was startled and said to myself "now is the time that British India may obtain independence." If I say so, people may argue that: "England being one of the greatest nations of Europe, and the country being so rich and the soldiers so strong, that all the nations of the five continents are afraid of her and, even Russia, who is so pugnacious and acquisitive, even after so many successive victories, seems to be somewhat afraid; so now how could the East Indians, who are poor and weak, manage to gain their independence:—they would no doubt be quickly defeated. Some may ask, am I not aware that the East Indians have already more than once revolted, but were always unsuccessful, which is a sufficient proof that a successful revolt is impossible. And suppose that they succeed in their attempt, their success or failure is no concern of ours? They may succeed or they may fail. At present the civilization of our country is yet very shallow and all things are far from being complete; thus we have much to discuss concerning our own affairs and rather than waste valuable time on such a useless subject, it would be better to discuss matters useful to our country." This may seem reasonable to some, who do not thoroughly understand my views. Let me therefore explain.

A child may know, that any attempt of the poor, weak East Indians to resist rich and powerful England and to gain their independence, seems a vain one, but success or failure depends a good deal upon chance and must not always be conjectured from the size or strength of any country. Should the poor always be unable to challenge the rich, the few challenge the many, Riuri could not have defeated Shin, and the Americans could not have gained independence. The reason that these succeeded, was simply through a combination of fortunate circumstances. England is very great and powerful, but Russia is equally so, and if, at the commencement of hostilities between these great powers, the people of India combined their forces, hoisted the flag of independence throughout the country and fought with the English heroically, it is certain that England, having a great enemy in Russia, will not be able to attend much to Indian troubles, and further, there are, throughout all the provinces of India, not a few who are brooding over their dissatisfaction against England, and if they hear of the British Indians attempting to gain their independence, they would rise in all directions, Afghanistan would come to help, Burmah would join in the attempt. If all these people joined their forces and fought with desperation, although they might have to employ hoes and spades in the place of other weapons and straw mats for flags, they will surely succeed. This is the reason I say that British India must not lose this opportunity.

If any one says "that the rise or fall of India is no

concern of ours," he must be greatly mistaken. Look at the actual state of the whole continent of Asia. The land is nearly all being swallowed up by the white people, the natives are nearly all made their servants, indeed the state of affairs is such as no man can bear to think of, and although there are two or three countries which call themselves independent, they also are now being invaded by the whites and although having the name of independent, yet are not so in reality.

The general state of Asia is such a decaying one, that unless we restore it, we—the people of Eastern countries, can not escape from becoming the slaves of the whites. This is what patriotic people have often been regretting long before me. Therefore we cannot put aside the question of the rise or fall of the East Indians, who are our brothers, but heartily wish that they would shake off their yoke and restore the natural right of individuals to themselves and thus gain happiness, as such happiness does not only belong to them alone, but to all the continent of Asia, as well as ourselves. Ah! the opportunity does not often occur, and it is easy to lose it. When could British India expect to gain its independence, if not at the present time?

EXTRACT.

IS THE TREATY OF SAN STEFANO TO STAND OR NOT?

(From 'Vanity Fair'.)

TO avoid the closest examination of the position now, with the hope that some solution will come of itself, would be to act like a surgeon who, when a patient came to him with a limb torn by the teeth of a mad dog, should be too faint-hearted to apply the actual cautery; but, instead of this, should wrap a bandage round the wound, and, as the gangrened surface inflamed and the virus spread, should place another bandage and another over the first one, rather than examine the wound itself.

Now or never, England must face the conditions which she has herself brought about from the action of her Government during the past two years; and it must be stated, *in limine*, that the Treaty of San Stefano is the natural and logical consequence of the Conference of 1876. The meeting to discuss the internal concerns of Turkey has brought the Russians into the suburbs of Constantinople, given them command of the capital, and placed the Ottoman Empire in their grasp.

The question now is whether the catastrophe is reparable or not. If it cannot be retrieved, then the Treaty of San Stefano must stand. Bulgaria must become a Russian province, garrisoned by Russian troops, and with the Bulgarians conscribed and divided into a new *corps d'armée* to act against Austria when the time comes. The Danube must be in Russian hands, that its navigation may be closed to Roumanian and Hungarian exports, and Roumania and the Kingdom of Hungary must be ruined. Commanding points, such as Salonica, must be given to Russia in the Mediterranean—no obstacle must intervene between her and the possession of Constantinople whenever it suits her to take possession. The eastern ports of the Black Sea must also belong to her, and so must the line of fortresses domineering Turkey in Asia, and the frontier of Persia, so that she may send *matériel* and supplies from every part of her dominions, not as heretofore, down the Volga or across the shallow Caspian, but by a new, easy, and safe route, whenever it suits her to reinforce her armies in Central Asia, on the borders of Afghanistan, and on the actual confines of British India.

She must be accepted in India by the Mussulmans as the protector of the head of their religion, prepared to free them from the abhorred British yoke. The Sultan must be a puppet in her hands; and the Turkish people, deprived of trade, unable to cultivate, ruined to the last para, and indebted in the sum of £41,000,000, indignant also with the treachery of England, must give to Russia the military service of vassals instead of the millions due, and must turn their arms, when ordered, either westward against Austria, or eastward against Persia, and then together with Persia, against the rule of England in India.

There is no exaggeration in this. It is as sure to come as the sun is to set to-morrow. No one can say what diplomatic mystifications may intervene, as no one can say whether between this and next sun-setting the weather will be fair or

cloudy; the metaphor, however, is not perfect, for it is not for man to change the course of the sun, but it is humanly possible to stay the downfall of England.

It cannot be done by negotiations or other diplomatic means. The Cabinet of St. Petersburg has certain precise and definite objects, from which they can no more be turned aside by the best reasoned Foreign Office despatches than a set of burglars can be deterred from a well-planned jewel robbery by the curate of the parish sending them a tract on the Eighth Commandment. With them the revolver or the policeman's truncheon is the only argument; nor would it be sufficient to deter the gang by a show of force for a night or two. Until there be capture and condign punishment, the coveted heirlooms cannot be considered safe.

What then can we do now, and what can Russia do? It must be admitted at once that she has got the most precious jewel of all in her grasp. Lord Derby's remarkable sentence, "The final question is, who is to have Constantinople?" has been answered. Russia has got it.

Let there be no cavilling here. On the 3rd of March the Treaty was signed under coercion. The Russian force of 40,000 men was under arms all day ready to enter the capital in case the Turks delayed any longer, and these were the words used by a Turkish Minister:—"We have signed the instrument of torture, and England must now look after herself." This force has not been reduced; it has been augmented. It has advanced to the Valley of Sweet Waters on the Golden Horn, and can at any moment enter or burn the city itself.

This is the one sole strong point of the Russian position. They have command of Constantinople, and can burn it when they like. It is no use disguising that this gives them an enormous advantage. In all other respects they are incalculably weaker than and inferior to England.

First as to Russia's military strength. From the Danube to Adrianople the Black Plague—the most frightful of scourges to humanity—is now raging. The troops of the Czar are dying daily by hundreds; the unburied carcasses of animals and men are spreading the infection; the season is the most unfavourable. From the north and from the south of the Balkans the armies must be withdrawn or perish miserably.

It is not a question of marching English soldiers to encounter Russian ones. Everyone knows, or ought to know, that the English naval force at the Dardanelles, having vessels in the Sea of Marmora and also in the Gulf of Saros, can take the isthmus and completely command it. Nothing would be easier than to land British troops there if necessary; but the fleet commands it, and it is not easy to see how a land force is required.

With Austria and England equally determined that the Treaty of San Stefano should not stand—and with Roumania to back them—what could Russia do, even granted that she had command of the Black Sea? True, as stated before, that she has Constantinople, so to speak, in pledge. But what use could she make of it? She would hardly burn it herself merely as an act of malice and to spite the Powers against her; while with England commanding the Dardanelles and to a great extent the Bosphorus she could do nothing of an offensive nature against them; she could not fight her way back across the Danube in face of Roumania and Austria; she could not allow her troops to remain in Bulgaria to perish of plague; she could not embark them, except at Bourgas, Varna, or some other port on the Black Sea, and so she would be compelled to surrender all the positions she has been fighting for.

Meanwhile, it cannot be too often repeated that England has the most complete financial and commercial control over Russia. Assume that her Majesty issued a Declaration of War on the ground that "She felt acted on by the sympathy of her people with Right against Wrong, by a desire to avert from her dominions most injurious consequences, and to save Europe from the preponderance of a Power which has violated the faith of treaties and defied the opinion of the civilised world," what follows?

First and foremost, this notice in the *Gazette* must be accompanied by a notification, diametrically opposite to the one by which her Majesty stated in 1854, that she would waive her right of seizing enemy's goods in neutral ships. The *Gazette* must contain this announcement:—"Seeing that the Declaration of Paris was never ratified by Us; seeing that it is in derogation of part of the ancient and fundamental laws of Our dominions which it is not competent for us to alter; seeing that the Treaty of Paris (of which

"the Declaration was not an integral and valid part) has now been violated by the very Power in whose favour We formerly waived the exercise of our maritime rights: We do hereby proclaim that We shall order all vessels duly commissioned by Us to seize Russian goods wherever they may be found, and to search all vessels for such goods, according to the Law of Nations."

In three months after this notification being issued and acted on, England might dictate to Russia whatever terms she pleased, and we hold that the terms should be these:—The absolute and entire abrogation of the Treaty of San Stefano. Armenia and the positions of Kars, Batoum, and so forth, and all the other parts of the Turkish dominions in Europe and Asia to revert to the *status quo ante bellum*, and more particularly the fortresses of the Danube to remain Turkish.

The Turkish Parliament has given proofs that but for Russian aggression it can well be entrusted with the duty of supervising the corrupt palace clique which surrounds the unhappy Sultan, and the disturbing influence of Russian agents of insurrection being removed, there is no question but the Ottoman Empire has the power of recovering itself. Bulgarian autonomy is now so patent an absurdity that it need not be discussed. This miserable and degraded people, who, it must always be recollected, are not of Slavonic but of Tartar race, will only be too glad to be freed from the horrors of the Russian yoke and lash they see impending over them, and to welcome back their old masters, under whom, as all now know, they enjoyed such a measure of sluttish prosperity as moved the deepest envy of the moujiks who came, as was ironically said, to emancipate them.

These, however, are but details. The first point is whether England is, or is not, at last to take a stand against the preponderance of a Power which has defied the civilised world and threatens us with the most dangerous consequences?

Lord Beaconsfield is now fairly on his trial. There is no scapegoat, no shield before him. It rests with him, having a Queen, Parliament, and a nation to back him, to put forth the might of England, and that immediately, to remove the sphinx-like mask he has so long worn, and to stand before the world as the true patriot and great statesman destined to recover Europe.

Or if this vote, if this calling out Reserves, be mere swagger to mystify and cover an intended compromise, then, in Heaven's name, the sooner he follows Lord Aberdeen's example the better. Let him take the Garter and retire into private life. And as there is not one man of any Party that the nation can trust, let her Majesty be entreated to resort to her old Constitutional practice.

Let her summon her Privy Council herself; let her preside over their deliberations; let each councillor record the advice he gives, and be answerable for it to the High Court of Parliament; and let no communication with Count Schouvaloff, or any other ambassador, take place save with the cognisance of her Majesty in Council. Then we may once more adopt Admiral Blake's maxim, "It is our business to keep foreigners from fooling us."

The publication of Lord Salisbury's despatch is opportune and valuable, as showing his appreciation of the results of this treaty of robbery and aggression. But if it bring about a compromise, securing to Russia all that she wants, though perhaps less than she demands, it might as well not have been written.

NOTES ON JAPANESE ARCHITECTURE.*

By JOSIAH CONDER.

ALL Japanese architecture, until the employment of foreigners within the last few years, has been, with very few exceptions, entirely of wooden construction. In certain parts of the country, where stone lies to hand in boulders or is otherwise naturally exposed, there are a few instances of its use in the construction of the walls of small houses and simple temples. There is a small temple near Nikko, about 14 feet square, of which the walls are built of oblong blocks of stone placed upon their narrow ends, forming the whole thickness of the wall, without bond, and having all the external joints covered with a large plaster roll to keep out wet. The roof is also formed of large slabs of stone hollowed out on the surface and cemented at the joints in imitation of tiles. In addition to this there are to be seen several stone bridges, large stone walls surrounding the principal cities, solid stone monuments to the dead, imposing flights of stone steps with stone railings

* A Paper read at the Royal Institute of British Architects on March 4.

leading up to the temples, lamps of stone and bronze adorning the temple precincts, bronze statues of gigantic size; and stone is invariably found employed in the pavement of courts, and as a substructure to wooden buildings in order to form a stable and dry foundation. On account of the constant fires which occur in the large cities, particularly during the winter, there are not many of the ordinary street dwellings which have not been repaired or rebuilt within quite recent times. The temples, protected by their isolation and in many cases by thick groves, also many important dwellings set apart by themselves, can boast considerable antiquity, but the ordinary domestic and street architecture is of comparatively modern erection. It appears, nevertheless, from such representations as can be found in books, that the arrangements and general appearance of the ordinary houses have not altered since very early times. They are fragile wooden structures, never more than two storeys in height. The walls are constructed of a vertical and horizontal framework of posts and beams morticed together, filled in with bamboo laths, laid crossing, bound together, and coated with mud in several layers, being finally plastered over. Sometimes the beams and posts show, being flush with or projecting beyond the plastered surface, and sometimes the whole is plastered over, framework and all. This latter method is employed in larger buildings, and in the "Kuras" or Godowns. A Kura is often many months in building, the mud, which is taken from the bed of some river, being spread over the framework in a great number of layers, each layer being allowed a long time to harden. The projecting timbers at the eaves are also thickly coated with the same clayey mud, and to the small window openings are hinged shutters coated to a very great thickness with the same material. The whole surface of the building is then plastered over, and finally covered with a coating of lacquer. These Kuras often remain standing after street fires, but they are by no means thoroughly fireproof, for the mud often cracks and falls off with great heat, and even under ordinary circumstances they require constant renovation and repair.

In the ordinary houses, one external wall or more, and most of the internal walls, are not filled in with plaster, but are open between the uprights, being filled in merely with light wooden screens sliding past one another in grooves formed in the head and sills of the framework, so that the whole partition can be thrown open at any part. Where light is required, these screens are formed of thin wooden framework, divided into rectangles of some simple design, and filled in with tough translucent paper, or in some cases in interiors they are covered with paper, decorated with patterns or paintings. Each room opens into the neighbouring rooms, and passages are seldom to be found, except in the largest of houses. Sometimes, however, the greater portion of a room will be raised about 12 inches above the level of the entrance, leaving an L-shaped space or passage on two sides. The raised portion is covered with mats, and used by the indwellers as the room proper. In small rooms the whole floor is on one level, and covered with mats. These mats are always manufactured of one dimension (namely, 2 feet 11 inches by 5 feet 10 inches, being twice as long as their width), and a room is invariably built, measured, and described, not according to its actual dimensions, but by its number of mats. They are made of rushes neatly woven upon a light wooden frame, are about an inch and a half thick, soft, slightly yielding and warm. The houses of the highest and the lowest, as well as all temples, have their floors covered with these mats, a little differing in quality. There is generally in one wall of a room a small recess formed in the framework, in which are placed one or two rows of shelves moulded, polished, and lacquered. These shelves are generally arranged in some quaint unsymmetrical manner, and both form an ornament to the room themselves, and serve for the display of vases or small ornaments. Even the lowest classes of the Japanese show great taste in judiciously disposing small treasures of good shape and colour to the adornment of their dwellings. They convert the smallest strip of land into a miniature garden, which they plant with well-trained shrubs and flowers.

The simple habits of the Japanese, both as regards resting and feeding, renders but little furniture necessary for the complete comfort of the householder. Small low tables, more like what we call trays, are used for serving up food upon—one being set before each guest. A metal-lined box, or sometimes an ornamental bronze receptacle, is used for the small charcoal fire from which warmth is obtained in cold weather. A room is invariably provided with one or more folding screens which, as the inmates sit or recline on the mats, do not require to be of any great height in order to secure privacy, and keep off draughts in cold weather. Small chests or drawers are to be found in private rooms for clothes, &c., and these, as well as the hibachis, tables and screens are mostly of some elegant shape and pleasing design. If a house be of two storeys, the upper storey is reached by wooden steps,

leading up from room to room, being composed of two strings with treads and no risers, somewhat inconvenient in their slope and generally without handrails. The ceilings of the rooms are wooden, consisting of the underside of the floor boards of the room above, crossed by the small joists supporting them, and sometimes smaller ribs between, dividing the surface into squares; the whole is polished or lacquered. Probably, in early times, houses of this class were covered with thatched roofs, projecting considerably at the eaves, or were covered with boarding and wood shingle.

In country parts there are now many roofs covered in such ways, but most of the houses in the cities have heavy tile roofs of great projection, with large ridge and hip tiles and terra cotta ornaments at the extremities. The roofs are often slightly concave on their surface, resembling those found on a larger scale in the temples, from which they are undoubtedly copied.

The Shintoo Temples, which are built in imitation of the earlier temples of that religion, prior to the introduction of Buddhism, have roofs of two plane sloping surfaces, very salient at the ends and at the eaves; and it seems from this that the heavy curved and hipped roof, which now abounds so in Japan, was an introduction from Corea or China contemporary with the religion of Buddha. The tiles are always of a greyish black colour, and the joints are covered with a thick roll of white cement. One great peculiarity is the size of the ridge and hip ornaments, which are constructed of several courses of tiles and cement, forming quite a little wall along the ridge and hips, terminated by large terra cotta ornaments at the extremities. These ornaments are most of them very artistic in shape.

In houses of two storeys the upper storey is sometimes set back a little, the projecting portion below being covered by a small lean-to roof. There is often below this another flat roof projecting some 3 feet from the lower wall to keep off sun and to protect the frail wooden entrances from wet. The roof is generally in part suspended from the roof above, and partly supported at wide intervals by light bamboo posts. Small gutters of bamboo are generally fixed to these lower eaves, with pipes of bamboo to carry off the water. In the hot season "sudaris" (a kind of cane blind which admits air and permits outlook, and at the same time gives shadow from the sun) are hung from the eaves to the ground. The above description applies both to the dwellings of the lower and the middle classes, the latter being somewhat larger, more cleanly, and better furnished.

The tea houses or hotels are on a much larger scale, and vary in their arrangements. They are very often planned on three sides of a little entrance court laid out as a garden—a verandah with a floor some 12 inches from the ground running round these sides and serving as a passage from one room to another. The upper storey also has generally a verandah covered with a salient roof, under the eaves of which paper lanterns are hung at night. In large hotels (called *Yadoyas*) there is generally a small interior court, in one corner of which, cooking is conducted in the open air, the rest being laid out in some ornamental manner, with ponds, streams, shrubs, and stone lanterns. Round this is an interior verandah, and often miniature wooden bridges enabling one to cross the court without dirtying the feet.

The dwellings of the higher classes, which are called "Yashiki," or "Miya," are considerably larger and more architectural. Their arrangement is very simple, being a group of somewhat low rooms, opening one into the other, having a lobby or hall at the entrance, and sometimes one passage from front to back. They are not more than two storeys in height, and are covered with a heavy tile roof of wide span with terra cotta ridge and hip ornaments, prominent eaves often supported by a rich cornice of beams and brackets, and having elaborate carving displayed in the gable ends. Over the entrance to the house there is a wide portico, supported upon strong posts which are often moulded on the edges. The lintels, beams and projecting rafters are also moulded on the edge, and carved with some flowing line of ornament, deeply incised upon the flat surface. Such ornament is very effective, being delicately and sharply cut, and can be seen from a great distance. The portico roof is either a continuation of the curved line of the large roof or consists of a smaller roof intersecting this. In the latter case a favourite form is that of a double ogee, convex at the ridge and concave at the eaves, forming a gable or semi-gable at the front. By this is meant, that on the front the curve of the roof is continued half-way, and is then, as it were, cut off, showing the sides of the end rafters projecting, decorated with bronze clasps and adorned with carved and pierced wooden pendants. In the large roofs the semi-gable is also a favourite form for the ends; in this case the upper portion is of the gable form and the lower portion a sloping hipped roof. What I have called bronze clasps or belts correspond to what, if placed at the end of a beam, would be called shoes, being gilt and engraved plates of metal placed in the

centre of exposed beams and lintels, serving for no purpose but ornament. They are much used in Japanese architecture. The windows are generally greater in length than in height, being low oblong openings filled in on the outside with thick wooden bars, arranged sometimes vertically and sometimes horizontally, the whole being open to the air. On the inside of these windows there are always sliding shutters or paper windows, to keep out wet or cold in bad weather.

The Japanese seem greatly to seek privacy for their houses; even when they are placed in country districts they are mostly fenced in. They sometimes have an open loggia to the upper floor as in the hotels, from which they can enjoy the surrounding view; but the approach to the house is invariably shut in, and the lower hidden by high railings of bamboo. In houses of one storey this fence often reaches as high as the eaves of the roof. The Yashikis are shut in in a similar manner, perhaps with a view to protection from treachery as well as the love of privacy. Not only are the whole grounds surrounded by a high wall on three sides, with a long range of buildings and strong gateway on the entrance side, but there is often a high wall or fence close up to the front of the house, through which the open portico projects. Between this and the outer gateway, with its range of buildings, there is a paved court, on the two sides of which, servants' quarters, stables, and other outbuildings are erected. From the street the outer gate and its surrounding buildings present in many cases a very pleasing façade. The long horizontal lines of ridge and eaves, as well as the horizontal effect obtained by the lower storey being constructed differently from the upper, is relieved by the vertical window bars and projecting bay windows on each side of the large recessed wooden gateway. The gateway itself is of very solid and strong appearance; thick posts, carrying heavy wooden lintels, which support the upper storey over the gateway, form the framework of the heavy doors. Both the posts, lintels, and doors are lavishly shod, belted, and adorned with plates of engraved and gilt bronze. The walls are generally placed upon a base formed of two or three courses of stone. The lower storey, instead of being plastered upon the outside, is sometimes covered with large tiles placed square or diagonally. They do not overlap, but are fixed to the laths, side by side, the joints being protected by a large roll of cement. The tiles being dark grey and the cement white, this treatment presents a somewhat curious, bold, chequered appearance. Placed symmetrically on either side of the gate are often two square projections, about 9 feet by 6 feet, of one storey, with an ornamental curved roof and carved gable. They correspond to our bay windows, and command a side view of the gate for porters or a guard who occupied these rooms. These projections have also a stone base, and are framed about four feet from the ground, with window bars and transoms placed very close together. They are protected when necessary by sliding shutters from within. Such windows also sometimes occur at the ends or the centre of the range of buildings on either side of the gateway. The other windows are either oblong openings, with thick wooden bars, or they are small projecting windows, framed out some few feet above the ground, and supported on carved or moulded wooden brackets at each end. This framework is sometimes perfectly open at the bottom, the whole front and sides being filled with close bars, and the top covered by a small curved lean-to roof. The inside is protected by sliding shutters flush with the inside of the wall of the room. In some Yashikis in Yedo these projecting window openings are continuous, running nearly the whole length of the building, with brackets at intervals. The whole of the exposed woodwork (gateposts, lintels and windows) is often lacquered in black or a dull red colour.

The smaller and inferior Yashikis are often of one storey only, and instead of being plastered or tiled, are frequently boarded with planks nailed on to the wooden framework slightly overlapping at the lower edge to carry off wet. The whole is stained a dull black colour. The outer walls, referred to as being placed round dwellings of this class, are either fences made of strong wooden posts and beams covered with planking, and protected by a little tile roof supported upon brackets at the top; or they are of considerable thickness constructed in alternate layers of tiles and cement, the cement being as thick in its layers as the tiles. The top is protected from wet and decay by a little projecting tile roof, with ridge tiles and ornaments similar to the roofs of small buildings. There are no instances of the walls of dwellings themselves being constructed in this way with tiles and cement. At the back of the dwelling within the surrounding walls are large grounds, generally laid out very prettily as a landscape garden. These Japanese gardens abound in grassy mounds and terraces, planted with an endless variety of trees and shrubs fantastically trained, with groups of large stone slabs and boulders, running streams, small lakes, fancy bridges and stone lanterns.

The military architecture of Japan seems not to have been much more substantial than the rest, though many cities contain large moats and the stone walls within which the castle buildings stood. The central portion of the city of Tokio is surrounded several times spirally by a deeply-cut moat with large grassy slopes. Towards the centre, this spiral forms a complete enclosure, and on the inside of this inner moat is a thick stone wall constructed in large polygonal blocks, which originally carried wooden defensive constructions surrounding the castle within. The larger number of these wooden constructions were pulled down some years ago, but those few that remain form, with the solid walls, deep moats and strong gateways, an extremely picturesque feature of the city. Comparing these remains with a rough plan of a castle, taken from a Japanese book, it appears that there were in the centre enclosure of these fortresses, one central building or keep of a towerlike form. Each storey is set a little back within the lower, the projecting portion below being covered with a very salient roof, adorned in some instances by little excrescent roofs presenting richly-carved gables. The top roof, which is generally hipped, is slightly concave and has a very bold projection. The towers are often oblong in plan, and then the ridge of the roof ends in a small gable, terminating in a hipped roof. These crowning roofs also carry little dormer gables, apparently neither used for light or ventilation, but as ornament; they are generally little roofs of a curved form. In addition to these dormers, the ridge and hip tiles are richly adorned with finials at the extremities, the ridge often terminating in a large representation of a dragon fish with the tail curled upwards, executed in copper. The walls are thicker than those of ordinary houses, but are constructed of wood filled in with mud and plastered over, showing only the wooden window-frames, which are filled in with thick wooden bars set closely together.

Close to these central towers is a cemetery for the dead with a little temple enclosed. There are also within the castle wall six or more large Yashikis, being the dwellings of the chief Samurai, or officers of importance and their retainers. In addition, a large mound commanding an outlook and several small Shintoo Temples, the principal one being dedicated to Hachiman, the god of war. The outside wall, constructed in large polygonal blocks of stone and backed with earth, is interrupted at intervals by large gateway constructions. The ponderous wooden gates are hung to heavy square posts with thick lintels above. These gate posts, some 18 inches square, often in pairs, are shod and belted with bronze plates, mostly gilt and engraved. The gates too are generally adorned with metal fittings. The approach is by a permanent wooden bridge erected over the moat. Upon the surrounding wall, built out for the purpose so as to flank those who enter the gateways, are erected towers similar to the interior keeps, though somewhat smaller; and also at all angles of the wall are two-storeyed towers. Between these buildings and the gateways a low building or shed covers the whole top of the wall, taking the place of the hoarding to our mediæval battlements.

(To be continued in our next)

THE "EURYDICE,"

(CAPTAIN MARCUS HARE.)

Copied with all hands but two off Dunnose Head, March 24.

IN sight of home, almost in sound of hail,
With a stern-wind the good ship sped along,
And her three hundred tars, young, lusty, strong—
Beneath her bollying clouds of snowy sail.

Eight bells! A darkness fell. With icy breath
Leapt from its sudden cloud the sudden blast,
Smote on full sails, and open ports, and past—
And ship and sailors had gone down to death.

Past—and sun shone once more on cliff and lea,
Sea smiled again, and sky got back its glow,
But all that life lay still and stark below,
For all the shine of sky and smile of sea.

And here and there, up from that ocean tomb
One rose, and fought with wind and wave, and fell,
And two of the three hundred live to tell
How swift that passage was from life to doom.

And now as hope, against hope cherished, dies,
And they that 'scaped a sea-grave, sleep on shore
Among the loved ones they shall see no more,
A still small voice to check our wailing cries,

"Think not these lives crowned with this death in vain,
Nor deem destruction falls with random sweep;
That they who past hence to that sudden sleep
Had been more glorious, in battle slain.

"Afloat, ashore, Old England's sons, each one,
Must hold life low as they hold duty high,
And ask not how or when 'tis theirs to die,
So they but die like men, their duty done;"

Punch, April 6th.

Vegetables for sale in Yokohama Market:—potatoes old and new, sweet potatoes cabbage, cauliflower, spinach, beet-root, radishes, lettuce, endive, watercress, pumpkin, horse radish, onions, celery cucumbers turnips, carrots, parsnips, spring onions and turnip-tops. Strawberries are plentiful and very cheap.

YOKOHAMA MARKET REPORT.

FRIDAY EVENING, MAY 24th, 1878.

IMPORTS.—Since the date of our last report, the market has been in an unsettled state, the contest still going on between holders and buyers of yarn. There is no doubt a large legitimate country demand, but native dealers persevere in trying to beat down prices, in the hope that the rapidly accumulating stocks will force holders to give way. This, however, the latter decline to do, the goods being happily, mainly in strong hands, and we noted this afternoon signs of weakness commencing to show themselves on the native side, slightly advanced prices being offered. It is to be hoped that holders will remain firm and not quit their goods under the contract prices to which they are justly entitled. These dishonest native dealers deserve the lesson.

SHIRTINGS are neglected: but, naturally, this phase of our import business will develop itself, more and more as the yarn trade increases.

WOOLLENS are almost unasked for: the approach of warm weather putting them out of demand and our Quotation list for these goods simply gives us the three degrees of comparison applied to the adjective 'dull.'

In **METALS**, the market is very quiet, **KEROSENE OIL** is improved in price and is well held, in the absence of arrivals. **SUGAR** remains much as by our last, but firm. In other sundries, we have nothing to report.

EXPORTS.—**SILK.** An advance of about \$20 on Hank Sorts has been made this week; the few remaining bales of No. 2 silk being taken at \$550. A certain amount of demand is perceptible in Europe and some Sendais and Oshius of medium quality have also found buyers at \$500 to \$480.

TEA.—This market has been very active during the week under review: settlements up to to-day amounting to 4,900 piculs. The demand runs on Teas ruling from \$18 to \$22 per picul, but few parcels are to be had at the first quotation. Supplies continue abundant; but, so far, have not been much in excess of supply and there is little or no accumulation of stocks.

BLACK TEAS, so far, have mostly made their appearance in sample parcels of three or four packages merely: only one parcel amounting to as much as 25 piculs having been reported settled at from \$28 to \$30 per picul. Fuller supplies of these are looked for about the 10th proximo.

EXCHANGE.—Really nothing has been done this week worth mentioning. The tea will only be financed for as American mail day approaches, and neither in Silk or Goods is anything doing to lead to operations in money. No local business has been done between the banks and the only transactions have been for private houses and of a quite trifling character. Rates close firm this afternoon.

*. The dates of Arrival and Departure of the Mitsu Bishi Company's steamers are susceptible of alteration, consequent on the necessity imposed upon the Company—by its contract—of connecting with the steamers of the Pacific Mail.

*. No days for Arrival or Departure of the Pacific Mail Company's or Occidental and Oriental Company's steamers having as yet been fixed, we are unable to tabulate them. Each separate steamer's departure from her port will be notified in the Table below, and the day of her probable arrival at her destination.

*. Three days are allowed in the P. & O. Company's Schedule for transit of the Mails between London and Brindisi.

*. Two days are allowed in the Messageries Company's Schedule for transit of the Mails between London and Marseilles.

E. L. B. McMAHON.

Yokohama, January 1, 1878.

SCHOOL FOR CHILDREN IN SWITZERLAND.

MADAME A. JAQUEMOT (née Dogny) proposes to establish at Geneva, Switzerland, a Boarding School for Girls, and for Boys under 12 years of age; where they will have the advantages of a sound education and sedulous domestic care.

Boys over 12 years of age may be committed to Madame Jaquemot's charge as boarders, and parents can thus secure for them the comforts of a home, with the opportunity of attending one or other of those educational establishments for which Geneva is so justly celebrated.

Parents wishful to place children under her charge at the Pension Dogny, may address their enquiries as to terms &c. to the Editor of the *Japan Times*, who is empowered to furnish them.

THE PROVINCIAL PARLIAMENTS.

WHEN the young Emperor Mutsushito, eight years ago, in the presence of his Council of State, of the Kugés, and Daimios, took oath, on ascending a strengthened and rehabilitated throne, that "a Deliberative Assembly should be formed, and all measures for the government of the country be decided by public opinion," he was made to promise that the impossible should be made possible, and that work should be done without tools or material. It is an easier task to make formulas than to establish facts; and it was speedily discovered by the enthusiastic young men who put these words into their Emperor's mouth, that men untrained to debate could not usefully deliberate, far less be trusted to legislate, and that 'public opinion' had to be created, before it could direct the country's policy. The first expressions of 'public opinion' through the new-born press called for, among other reforms,—the abolition of monarchy and aristocracy, the establishment of a Republic, universal brotherhood—so far as communism and re-distribution of property on socialistic principles typify that sacred tie—the expulsion of foreigners, general opening of the country to foreigners, the stimulation of foreign trade, the return of the country to commercial isolation, and a heterogeneous multitude of other and conflicting changes. The only doctrine on which there seemed to be any *consensus* of opinion, was that of getting rid of any statesman who failed to meet each writer's views, by means of the simple old sabre. It can hardly be matter of surprise that the expression of 'public opinion' should have been immediately subjected to wholesome restraint, or that a parliament was not summoned, which was certain to fall to hard words immediately on its assembly, and too likely to betake itself, with short interval, to harder blows. Fresh from witnessing the triumphs of western civilization which are the result, mainly, of free presses and free parliaments, but unversed in the long history of struggle and disappointment and compromise, of which these blessings are the outcome, it was very excusable that the rulers of young Japan should have fallen into the error of imagining that to state an idea of reform, and at a bound to achieve its accomplishment, are processes so close in sequence as to be almost continuous. Conviction of their mistake has been forced upon them, and they appear to have grasped the truth of Aristotle's maxim 'First establish a polity, then improve its condition.' Eight or ten years of costly material progress, and of political advancement, checked at intervals by riot and rebellion which have only been repressed by more costly expenditure,—because lives more valuable than gold have been sacrificed—seem to have at last firmly established the existing form of government. And what is it? A despotism administered by admirers of constitutional government.

The publication of the Bill for the creation of Provincial

Synods in the *Fu* and *Ken*, a translation of which, as finally settled, appears in another column of this Review to-day, marks an epoch in the history of Japan very worthy of note.

The convocation of the *Chiho-kwan Kuwaigi*, or Assembly of Provincial Governors, though falling far short of the Parliament which was thought—and we, believe, meant—to be promised by the Imperial Oath, seems to us to be practically as long a step towards its fulfilment as could be taken safely, in the existing state of Japan's political infancy; and this, the most important of the three Bills presented to them for discussion, is most creditable to its authors,—the lamented Okubo and his friend Ito. And though the *Chiho-kwan Kuwaigi* have sent it back to the Executive very much as it came to them, it is an evidence of their good sense that the principal alteration they have made in it has been a conservative one, in the direction of limitation of the franchise. As it now stands, it is a proof of the wish of its framers to temper and ameliorate the despotic system, but, at the same time, of a wise recognition of the necessity of educating the people, to fit them for the reception of larger boons of liberty. The people are now to be entrusted with as much power and freedom of discussion as they seem to us at present fit for, and everything now depends on the use they make of them. Every friend of true liberty—not license—every true friend of Japan will watch with interest the working of the experiment, and will watch also how its progress is regarded by the excitable native press. The Synods to be elected under this measure, may have but a small part to play in the government of their provinces. Their session is very limited in time, and they have but small power of originating legislation. Their right of discussion, except on subjects introduced by them in the form of petition, is limited to such measures as are presented to them by the Governor,—in the same way as this Bill itself was presented to the Assembly of the Governors by the Cabinet. And any attempt to extend these limits may be arbitrarily stamped as 'seditious,' and cause the adjournment, if not the dissolution of the assembly. But, in spite of these drawbacks, the work of the delegates will not be thrown away, nor what we take to be the wise purpose of the statesmen who framed the Bill, defeated; if the Synods' deliberations draw the attention of their constituents to the value of self-reliance, impregnate them with a pride in even the infinitesimal amount of self-governance permitted, and gradually educate the constituency to an intelligent interest in the affairs of the country. And a certain amount of material progress may be predicated as likely to be facilitated by their labours. Sanitary measures—for instance,—the adoption of new systems of drainage, the establishment of special hospitals for treatment of infectious diseases, &c., are less likely to be resisted at point of pitchfork, under the 'mat banner,' by ignorant rustics, if such be passed in the provincial parliament by the elected elders of the

villages who are sent to compose it. In the same way, the use of machinery, recovery of waste lands, care of forests, construction of roads and bridges, re-assessment, re-adjustment of taxation, and a crowd of other improvements or reforms will be easily accepted by the people, if recommended or sanctioned by their own elected representatives, which would be perhaps resisted, certainly grumbled at, if simply ordered by Governmental edict. Thus, the Imperial authority will be strengthened, while, at the same time, the Imperial sworn promises will be in some measure redeemed. Whether the Bill will work smoothly and successfully, without still further subdivision of these Provincial Synods, is another question.

The term 'Municipal Councils,' by which our translator renders the Japanese title (*Fu Ken Kuwai*) has been adopted as one made familiar to foreign residents in China and Japan, as that given to the elective directorates of the internal affairs of the settlements at some of the open ports. As a title for the governing body of a district, or country, —an area comprising in itself townships and villages, populations urban and rural,—it is a misnomer, whether we consider its derivation from the Latin, or its signification as applied in practice in ancient Italy, or in modern Britain, France, or Germany. 'Municipalis,' 'municipality,' 'borough,' 'municipalité,' 'municipalität,' all imply the governance of free, or favoured townships,—as opposed to the governance of districts. By the privilege of 'municipality,' townships acquired internal autonomy, while the terms themselves sufficiently distinguish '*urbs*' from '*rus*.' But we retain the name most familiar to the majority of our readers. The point is of no great importance, for, under any name, the proposed syndicates must necessarily, we have grave reason to fear, be incongruous in their purposes, and irreconcilable in their action. The interests of 'town' and 'country' in no cases agree; wants and needs are dissimilar, wealth varies, population is inconstant, and rationally disproportionate. Roads, lighting, water-supply, provision for the poor, in each case have to be dealt with, and their expense provided for, in different ratios, and from diverse sources. Control and disposition of sewage, construction of buildings, rights of wards, guilds, trades and parishes, important in one case, are trivial in another. From an European stand-point, this is one view we must take of the Bill. But while we fear that conflicts between opposed interests, such as these and others, may mar the initial success of the scheme, we hail with pleasure the establishment under it of representative Councils. For, while they cannot fail to familiarize the people with the use and working of representative Government, and to gradually educate them to a sense of the trust and responsibility it confers,—they will also constitute a school for politicians, in which they may learn how to handle the keen edge-tools of satire, party-spirit, and declamation, with safety to their own fingers and others' throats, and in which they may show the Government, too, that opposition does not mean frenzy, nor the advocacy of a change of policy necessarily imply annihilation.

THE PROVISIONS OF THE BILL.

TURNING now to the Bill itself, and considering it as a piece of legislative art, it shows a conciseness of design which compares favourably with the sinuous enactments of our own legislature. If we could assume, for the moment, that the internal arrangements of both *fu* and *ken* are such as can be satisfactorily managed under this Bill,—without prejudicing the conflicting rights of townships and of village communities, the scheme shows a simplicity of treatment which would delight an English Parliamentary draftsman, even while it excited his envy. Loving perspicacity and clearness, he always finds himself driven

into complexity and obscurity. He is ever trammelled with the necessity of preserving the relative positions of clerks of the peace, and town-clerks, justices of counties and justices of boroughs; and has to provide for the claims to the franchise of freeholder and leaseholder, compound householder and lodger—to say nothing of the vested rights of freemen, scot-and-lot voters, and even the humble but useful 'pot-walloper.' And sometimes, too, he is driven almost to despair by some time-honoured right with an obsolete name, some 'cinque-port' 'soke' or 'liberty' which comes cranking in and cuts 'a huge half-moon, a monstrous cantle out' from the best revenues of his county. Here, such vested rights either do not exist, or are not sufficiently powerful to exact any respect from the framers of the new measure, whose twenty-eight short clauses are therefore devoted to the enunciation of a few simple principles, and even descend occasionally to the regulation of matters usually, with us, relegated to the code of 'Byelaws.'

The first eleven of these determine the franchise,—the qualifications of the members of Council—and those of the electors. To the synod of each *fu* or *ken*, the respective *gun* and *ku* of which the former are composed send each from two to five members, according to their extent and importance: the distribution of seats among these various divisions being apparently left to the Governor of the Province, under Art. 26, which empowers him to frame the Bye-laws of the Councils. And here we may appropriately remark that, until these Bye-laws are published, we are left very much in the dark as to the operation of the Bill not only as regards distribution of seats, but also as to the method in which will be dealt with the conflicting urban and rural interests which we have enumerated, and—a most important point—as to the powers to be conferred on each particular synod for raising funds for municipal expenses. We are told in Art. 19 that the Municipal budget shall be discussed and adopted by the Council, subject to the Governor's approval; and also, in Art. 25, that the Governor shall, at the beginning of each ordinary meeting, produce the accounts of the preceding year. But it does not appear clearly with whom—Governor or Council—lies the power of initiating proposals for local taxation. This of course is the most important part of the whole scheme—power over the national purse once entrusted to the people, the other privileges of constitutional freedom must follow, and only the question of time remains for patience to solve. It would seem from the wording of this Bill, and without further information, that the central Government, while allowing to both Governor and Synod the power of discussion and remonstrance, virtually keeps the purse-strings in its own hands. We expect it will be found that the yearly Budget of each *fu* or *ken* will be framed for it in Tōkiō, and submitted to the Provincial Synod by the Governor. But from the provision that, in case of 'disagreement' between Governor and Council, an appeal may be made to the Minister of the Interior,—it is clear that the great step towards freedom is gained of ventilation of grievances, and as such will mostly take the form of pressure of taxation, the council may, in effect, gradually gain some control—at first perhaps indirect, over the finances.

We are glad to remark that universal suffrage forms no part of the plan; and though the small payment of five *yen* ground rent only per annum may seem to an English eye a perilously low franchise, it is not so in Japan, hampered as it is in this Bill, too, by necessity of residence. With holdings of land so minutely subdivided as here, houses so cheap, and the cost of living so small, five *yen* ground rent to Government implies the possession of a house and the position of head of a family, and fair representation appears to us to be given, by this provision, to property,

while the error of giving it an overpowering weight is avoided. And, by establishing residence and property together as a joint qualification, the allegiance of the voters to their township or village is secured; for it is to be noticed that no amount of property, without residence, entitles to a vote, or to a seat in the council: a man leaving one *gun* or *ku* and going to reside in another, *ipso facto* losing all electoral interest in the former, and having to vacate his seat in the council, should he have been representing it there.

Elaborate directions are given for the conduct of the elections, in several of these first clauses, but we remark with surprise—for the Bill bears marks of foreign skilled draftsmanship—that all provision for the nomination of candidates has been omitted. Also, that no means are provided whereby the candidates are to be brought to the notice of the electors before election. These are grave errors, and likely to lead to embarrassment. If the Government purposely excluded nomination clauses from the Bill, with the idea that their own candidates could be quietly put forward and a majority for them secured,—they have overlooked the danger of the same tactics being adopted by any factious section of an opposition party. Also, the voting being by ticket,—unless public nomination precedes election, there is nothing to prevent any elector nominating himself and getting a few personal friends to vote for him. The constituency may thus be split up into an unlimited number of fractional parts, and the members of council returned represent, by no means the *gun* or *ku*, but a variety of small minorities of its inhabitants. We should strongly recommend that nomination clauses should be tacked to the Bill, either in the form of bye-laws, or by a short supplementary enactment. Otherwise it is extremely likely that the people, directed by the press, will nominate their candidates,—at all events after the first election,—by the vicious process of secret caucus. The very breath of free representative institutions is publicity.

With the remark that the Presidents and Vice-presidents of these Councils are to be elected by the members, subject to the approval of the Governor of the province, while the Secretaries are to be appointed by the executive and presumably to permanent posts, we pass to the other division of the Bill, consisting of seventeen clauses, which deals with the duties and powers of the Synods, when assembled. Their duties are sufficiently onerous, but their powers are not extensive. Provision being first made against their turning themselves into debating clubs, and discussing the affairs of the Empire instead of those of their *ken* or *fu*,—a fault to which we should imagine the educated class of Japanese specially prone—they have first to pass the financial accounts of the past year, and to receive and discuss the Budget for that current: and then to debate on any proposals laid before them by the Governor. Scant time will be left for the discussion of their own independent motions, or 'petitions.' It is to be presumed that the session of their Councils is limited to thirty days, out of regard to the convenience of the members and the necessities of agriculture; and members receiving, as we are extremely glad to see, no remuneration for their services, thirty days during the year—with an occasional short emergency session—is as long a period as can be spared from the avocations of business. But one of the staple bye-laws of each assembly will have to be a limitation of time for each speaker: otherwise very little work will be got through in the month.

That the powers of the Synods are at present severely limited, and that a very firm check is retained for the Prefect upon their debates, evidences—as it appears to us—most prominently, the wisdom of the statesmen who had charge of the bill. As we have pointed out, these assemblies must be considered mainly as schools for future legis-

lators; the people of Japan are certainly not to be trusted, at present, with the powers of legislation: and, besides, we look upon the scheme as intended only as a tentative one. It will depend entirely upon the behaviour of these first councils whether their scope be enlarged or contracted, or whether, indeed, their continued existence be permitted. We look to them to display such moderation in debate and such loyalty to the Crown, as will prove that they are worthy of greater trust: should increased powers not be then voluntarily granted to them, they will find that they will have acquired such a power over the management of their respective *fu* or *ken* that they will be able, with good show of authority, to ask for them. For abstention from factious opposition to Government will deprive the executive of any excuse for repealing the Bill, and the power reserved to the Prefect of suppression or dissolution of the assemblies will be neutralized. The people, whose respect their temper and moderation will have won, will be at their backs. And even the exercise of that clause which renders ineligible for return in the new assembly the members of a suppressed one will be futile, if those members deserve and possess the confidence of their constituencies, for these would send back to the new council members pledged to carry on the work of the old. With newspapers, too, springing up, as they are, all over the country and means of inter-communication being rapidly improved; any arbitrary exercise of governmental authority in a single *ken* or *fu* will have arrayed against it the force of national, as well as of provincial, public opinion.

The limits of space which we can devote, in any one number of this Review, to the consideration of even such important subjects as this, and the absence of the Rules and Byelaws which, in each *ken* or *fu*, are to be framed by the Governors, preclude our considering, at present, the changes which will be wrought in the existing policy of local administration by the working of this Bill. We await the publication of these supplementary enactments in the *Tōkiō fu* and our own *ken* of Kanagawa with great interest. We have given ample proof that the principles of the measure have attracted our critical attention, and we think our readers will study it with equal interest: but we regard the application of the measure and of the rules to be framed for its working as more important still: as it is to these that we must look for the fruit of the young tree of Liberty just planted in the soil, and a great trust is imposed upon the Governors of Provinces, so to graft upon it the routine of their several departments, as to preserve intact its spirit and vital principle, that this fruit may not be disappointing and bitter to the taste. The people should accept the measure with confidence and gratitude; they have in it the germ of representative parliamentary government, and it depends greatly on themselves, and how they foster it, whether this ever reaches full maturity. And, finally, it is a measure most creditable to the present government, as evidencing a sincere desire to redeem the Oath they put into their Sovereign's mouth when they restored him to his throne,—and evidencing, too, their wish, prudently and quietly, to pave the way for the coming generation of Japanese freemen who will raise the country in due time to that place among flourishing constitutional monarchies to which the patriotism, high spirit, and intelligence of its inhabitants justly entitle it.

[It appears most convenient to print, here, the provisions of the Bill.]

ART. 1.—The members of the Municipal Councils in *Fu* and *Ken* are to be elected by the people in each *Gun* or *Ku*, as their representatives. The number of the members from each *Gun* or *Ku* is not to be less than two or more than five. In such *Gun* as are divided into several *Bu* each *Bu* may be considered as a *Gun*.

ART. 2.—The President and Vice-President of the Muni-

cipal Council will be elected from and by the members, subject to the approval of the Governor of the *Fu* or *Ken*. Neither President, Vice-President nor members are to receive any salary, but their travelling expenses and their daily expenses during the sitting of the Council will be paid for them.

ART. 3.—The Secretaries of the Council will be appointed by the Governor and act under the instructions of the President.

ART. 4.—Eligible as members of the Council, are persons over 25 years of age, born and resident within the *Gun* or *Ku*, who pay a yearly ground tax of more than 10 *yen* in the *Fu* or *Ken*.

The following are the exceptions :

- 1.—Insane persons ;—
- 2.—Persons who have been convicted of theft, or have suffered more than one year's Penal Servitude ;—
- 3.—Persons who have been bankrupt and have not yet finished their payments to their creditors ;—
- 4.—Government officers and Priests.

ART. 5.—The Franchise belongs to persons over 20 years of age, born and resident within the *Gun* or *Ku*, who pay more than 5 *yen* in yearly ground tax.

The exceptions are the same as those contained in clause 1, 2 and 3 in the preceding Art.

ART. 6.—The Governor of the *Fu* or *Ken* shall, by public notification, appoint a day for the election of the members and the *Guncho* or *Kucho* shall, likewise, at least 15 days beforehand, give public notice of the same.

ART. 7.—The elections shall take place in the public ward of the *Gun* or *Ku* and the *Guncho* or *Kucho* shall count the votes and generally superintend the election. The *Guncho* or *Kucho* may, if convenient, hold the election at places other than the Public ward in the *Gun* or *Ku*.

ART. 8.—The *Guncho* or *Kucho* shall cause voting tickets to be distributed among the voters, who shall get the same inscribed, at places other than the election hall, with the name, residence, and age of the candidates they wish to vote for, and shall hand the same to the *Guncho* or *Kucho* on the day of election. Those who obtain a majority of votes, shall be declared members of the Municipal Council and in case of a tie, the candidate older in age shall become the member.

ART. 9.—After the voting shall have been finished, the *Guncho* or *Kucho* shall examine the voting tickets and shall reject those which contain names of candidates who are not eligible, and adopt those who next obtained most votes.

ART. 10.—The members are elected for a term of three years, after the expiration of which, a new election shall take place. Members are eligible for re-election.

ART. 11.—If a member happens to fall under the category which is provided in the above exception 2 in the 4th Article to the general qualification for membership ; or if he does not appear at the Council, except from unavoidable cause, if he is absent through removal to another *Gun* or *Ku*, death, or sickness &c., a new member shall be elected in his stead.

ART. 12.—The *Fu* and *Ken* Municipal Council shall meet in the month of March, every year, for a period of 30 days. The Governor shall open and close the session, and if a prolongation of the session or an extraordinary session should be required, the same may be granted by the Minister of the Home Department, on application made by the Governor.

ART. 13.—If the discussions in the Assembly should ever become of a seditious nature, the Governor of the *Fu* or *Ken* may provisionally close the Assembly, and shall report the circumstances to the Minister of the Home Department for his decision.

ART. 14.—Under such circumstances, the Minister may, at any time, declare the Assembly dissolved.

ART. 15.—If the Assembly be thus dissolved by the Minister, a new election of members shall take place, in which, those who were members of the dissolved assembly shall not be eligible for reelection for three years to come.

ART. 16.—Bills for discussion in the ordinary or extraordinary meetings of the Council, shall all be prepared by the Governors of *Fu* and *Ken*.

ART. 17.—The sphere of action of the Municipal Council is limited to municipal matters in the *Fu* or *Ken*, and the Council is not to occupy itself with the general administration of the Empire.

ART. 18.—More than half of the number of members must be present to constitute a quorum.

ART. 19.—The municipal budget of the *Fu* or *Ken* shall be discussed and adopted by the Municipal Council, subject to the approval of the Governor. In case of disagreement between the Governor and the Council, the Governor shall lay the case before the Minister of the Home Department and abide by his decision.

ART. 20.—The Governor may bring before the Council any matter concerning the *Fu* or *Ken* and take its sense on the subject.

ART. 21.—An extraordinary session of the Council shall confine its deliberations to the sole object, for which it has been specially summoned.

ART. 22.—If during an ordinary session, one or two members desire to present a petition to the Government on municipal affairs in the *Fu* or *Ken*, they shall obtain permission from the President to make a motion in the Council and if more than half of the members support the motion, the latter shall be considered as embodying the opinion of the Council, and shall be forwarded to the Minister of the Home Department by the President.

ART. 23.—Matters in the Council shall be decided according to majority of votes, and in case of a tie, the President shall have the casting vote.

ART. 24.—The Governor of the *Fu* or *Ken* or his representative may explain, in the Council, the objects of the bill, but is not entitled to a vote.

ART. 25.—The Governor of the *Fu* or *Ken* shall, at the beginning of the Council's ordinary yearly meeting, lay before it the financial accounts of the *Fu* or *Ken* for the previous year.

ART. 26.—The Rules and Byelaws of the Council shall be framed by the Governor and conducted by the President.

ART. 27.—The sittings of the Council are to be public, but both the Governor and the President shall have power to order them to be held within closed doors.

ART. 28.—It is the President's duty to maintain order in the Council hall and if any one present misbehaves himself, the President shall have power to order him to be removed, and in case of violent conduct, to hand him over to the police.

THE FINANCE NOTIFICATIONS.

THE following important Notifications respecting the Trade Dollar, and revising certain of the Coinage Regulations, were issued in Tôkiô on the 27th inst. :—

NOTIFICATION No. 12 by the *Daijokuwan*.

"It is hereby notified that the Silver Trade Dollars, which have hitherto been coined for the convenience of trade in all the open ports, but which have hitherto only been circulated within the limits of those ports, shall hereafter be free to circulate generally, and may therefore be used in paying taxes and in all business transactions, either public or private."

(signed) SANJO SANETOSHI,
Daijôdajin (Prime Minister.)

NOTIFICATION No. 13 by the *Daijokuwan*.

"It is hereby notified that :—Silver Trade Dollars having, by Notification No. 12, been authorized to circulate generally ;—the Coinage Regulations notified in NOTIFICATION No. 108, the 6th month of the 8th year of Meiji (June 1878) have been revised as under. The limit of circulation of the coin is enlarged; the charges for coining, and the limit of bullion received for coinage, are decreased; and the period shortened between receipt of the bullion and delivery of the coin. That is to say, in the Coinage Regulations, the undermentioned changes are made :—in the 5th clause of Notification 108; in the Note to Art. 4 of the Coinage Rules and in Articles 9, 11, and 13 of the same."

(signed) SANJO SANETOSHI,
Daijôdajin (Prime Minister.)

[Revisions mentioned above.]

5th CLAUSE of the Limit of circulation of coin is revised thus:—

"These Trade Dollars may be used in paying the Customs' duties and any other taxes paid by foreigners, and in all business transactions between Japanese and foreigners; also in payment of all taxes in the interior; and in all other payments, public or private, the same shall be legal tender to any amount.

"In NOTE to ARTICLE 4 of the Coinage Regulations (respecting the fixed amount of silver bullion receivable by the Mint for Coinage):—

"For 'silver bullion will be received in quantities of 1,000 ounces' read 'in quantities of 500 ounces.'

"In ARTICLE 9 of the same (respecting the period to elapse between receipt of bullion and delivery of coin:—

"For 'twentieth day' read 'tenth day.'

"In ARTICLE 11 of the same (respecting the charge for coining:—

"For '1½ (one-and-a-half) per cent read 1 (one) per cent.'

"In ARTICLE 13 of the same (respecting the charge for re-coining:—

"For '10 (ten) per thousand'—read '5 (five) per thousand.'

We should hail these Notifications with pleasure, as steps towards the point at which we are anxious to see Japan arrive,—that of issue of coin for the China trade, as well as for her own—were the changes made in favour of the Japanese Silver *yen* of the same weight and fineness as the Mexican Dollar. But as an attempt to bring into circulation as coin the stamped ingots of silver which are called Trade Dollars, of 420 grains weight, we regret their publication. Our hope is as far as ever from fulfilment, and the expectations of the authors of the Notifications will not be attained. The Trade Dollars will continue to pass out of one set of melting pots only to go into another, foreign bullion will not be attracted to the Japanese Mint, the opportunity now offering in China for a successful attack upon the Mexican Dollar will be allowed to slip past unseized; the Mexican Dollar and the tyranny of the shroff will remain excrescences from our trade—or Hongkong will establish a Mint of her own—and then, not only will all hope of a profitable coinage business for Japan in the China trade be lost—but the British Dollar will push out the Mexican and push out the Japanese *yen* too. All the profit hereafter to be made, from subsidiary coinage for use in China will also, in that case, go to the Hongkong establishment, instead of to that at Osaka, and whatever bullion Japan may coin into Trade Dollars for her own use will continue to be drained out of the country as fast as they are produced and quietly sold back to her as bar silver to coin over again. Another outlet for them, which has evidently escaped the Finance Minister's observation, has just been provided in addition to those previously existing, by recent legislation in America. Is there no one in the Financial bureau of this country who can point out to his chief that it will pay foreign bankers to send Japan's trade dollars to the United States' Mints to be coined into the new silver currency just legalized there?

It will be remarked, also, that in these Notifications, no mention is made of gold coin. As the law stands at present, gold is a legal tender to any amount; and now the silver Trade Dollar is given equal currency. The Finance Minister appears bent on committing as many mistakes as he can. He oppresses his country with the evils of bi-metalism, at the same time that he orders the mintage of the wrong description of silver coin.

As matters of practice and fact, and of interest to the foreign trade, of course, these Notifications are valueless, because trade will be carried on as before, with the Mexican Dollar and the paper currency as the *medium* of exchange. Foreigners will certainly not send in bullion to be coined into Trade Dollars; and what little bullion Government has

to coin, gold or silver, will be drained away as before by the Mexican. It is vexatious to friends of the country and well-wishers of her Government, to see an opportunity like this lost, and a wrong course taken, in direct opposition to the advice of experts, to the teaching of experience, and to common-sense. But we abandon the subject in despair, and the only questions relative to it which retain for us a spark of interest are:—'Who are the Finance Minister's advisers? By what arguments have they induced him to the step he has taken? And how will he justify it to his colleagues in the Government when its failure is apparent?' More than ever, perhaps, are now felt the deficiencies of the native press. We find in it as yet neither attack nor defence of the Notifications: the subject appears to be beyond the grasp of native journalists. And regrettable, too, is the unwisdom which killed in its birth what might have grown into a most useful means of education: a combined alien and native journalism. Did newspapers now exist, conducted by foreign and native Editors in partnership, this most important question of the currency might have been fully argued out on both sides and in both languages. The Finance Minister then, with *all* the arguments before him in clear light, could hardly have failed to arrive at a right decision. It would not have been that which we have now to condemn.

WE are enabled to day, by the courtesy of the *Japan Gazette*, to reproduce from that paper the record of Imports and Exports for April, compared with those of March. The former show an increase of close upon half-a-million dollars, Kerosine oil figuring for nearly \$137,000 of that amount, Sugar for nearly \$120,000. Woollen Manufactures have been imported for \$84,000 in excess of the March returns, while Cottons show a decrease of nearly \$108,000. This is entirely owing to the slackening of the excessive supplies of yarns, these having fallen off to the extent of \$243,000 odd, while Grey Shirtings have been brought in,—in excess of the March importation—for \$120,000 against \$74,000, and all other cotton staples more largely imported. \$50,000 worth of Cloth, \$10,000 worth of Blankets, and \$17,000 worth of Mousselines go far to make up the excess in the Woollens market. Metals have contributed to the general increase about \$73,000 and almost every article in the Miscellaneous list shows an increase, swelling altogether to about \$160,000. As, during April and May, trade in this market has been far from brisk, and delivery very slow, stocks of all imports are heavy. Now that the Tea season is fully commenced, however, we may look for some relief, but no great clearances can be expected until native merchants have been put in funds by sales of new silk, six weeks or two months hence. We have reason to believe that the opinion we expressed early in the year—that the distribution of government money attendant on the suppression of the South-western Rebellion had opened new markets for foreign goods, was correct. The large demand for foreign Sugar of course is greatly accounted for by the disarrangement of the Satsuma trade, but the demand for textile fabrics indicates a legitimate and permanent expansion, we think, of foreign business.

The state of the Export trade may almost be predicated without reference to the table: a considerable falling off, inevitable at this season: the returns for May and June will tell another story. Turning to the lists, we find \$124,000 worth less silk exported and the Rice export—to the extent of \$154,000, entirely stopped. This latter article, however, it must be borne in mind, is entirely on Government account. The export of Tea, on the other hand, is increased to the extent of about \$20,000, the clearances of the old season's crop, got off at low prices, and \$65,000 worth of wheat, against \$45,000 worth sent away in March,

helps a little to diminish the fall in exports. But it remains very large—\$281,000.

The total Imports of the two months amounts to \$5,838,654, against Exports valued at \$1,383,439, a difference of nearly three-and-a-half millions. The balance of bullion exported is about \$1,222,000.

When these valuable tables are completed up to the end of June, and we are in possession of some information respecting the prospects of the new silk-crop, we shall more minutely examine them. Meanwhile, the commercial public are much indebted to the *Japan Gazette* for making up the returns, which involves two or three hours' work per day, and we are glad, ourselves, to take the opportunity of thanking the proprietors of that journal for permitting us place them on record thus in the pages of our own Review.

PAPERS OF THE GERMAN ASIATIC SOCIETY.

(Specially translated for the 'Japan Times'.)

CONTRIBUTION TO THE HISTORY OF MATHEMATICS IN JAPAN.

By A. WESTPHAL.

LIKE other sciences and arts, the mathematical science was not originally discovered and cultivated in Japan. The Japanese cannot thank themselves for their mathematics; all their knowledge of this subject is due partly to Chinese literature, which either came direct from China or was known through Corea, and partly to European science.

The earliest notice is found in Siebold's *Nippon*, from which I take the following extract: "In the year 553 after Christ, Japan sent the King of Petsi, who had begged for assistance against Kaoli, a present of two ships, two horses, and fifty bows and arrows, and requested in return doctors, diviners, arithmeticians and almanack makers." The wish of Japan, at least as far as mathematics were concerned, does not seem to have been gratified at this time. According to information which I have received from native scholars, it seems that the Chinese system of Mathematics was first known in the Taihō period, that is about 706 A.D. At first their knowledge was very meagre and does not seem to have reached that of the four kinds. Ozuki and Mijoshi are named as the chief scholars of the new science. The young plant however, did not find favourable soil in Japan, for, improbable as it may seem, I have been frequently assured by Japanese mathematicians that in the Keichō period (1596-1615) there was no one in the Empire who had any mathematical knowledge.

Taiko Sama sought to remedy this want by sending one of his subjects, Mori Shigeyoshi to Corea, to study Chinese mathematics. In a short time Mori returned and informed the Shōgun that on account of his low rank, he had not met with a cordial reception. Taiko immediately made him Prince of Dewa and sent him a second time to Corea. He now learned the Chinese system of Mathematics and then returned home; hence he is called by the Japanese the renewer of mathematics. He is also said to have brought the *Soroban* to Japan. He brought also the work "*Sanpō Tōsō*" and "*Sangaku Keimō*," which chiefly contain the Chinese Arithmetic and Algebra and were written by Shusei-kezu, in the time of the Ming dynasty. At this time the Chinese knowledge of mathematics had become somewhat meagre; all the sciences flourished greatly under the Ming dynasty; but through neglect this was followed by a quick decline under that of Sin. Much had fallen into oblivion, and on this account Mori's labours were beset by many difficulties. He succeeded only in teaching his countrymen the four species of mathematics.

His pupils built on this foundation. The most renowned were Yoshida Mitsuyoshi; Takahara Yoshitane, Hirano and Sawaguchi. Yoshida Mitsuyoshi wrote the work "*Jinkōgi*," in which besides the four species he taught how to extract the square and cube roots. Sawaguchi, from the *Sangaku Keimō* above mentioned, taught the use of the *Soroban* or Chinese instrument for reckoning, and also Chinese algebra. This last circumstance, as well as that mentioned of Yoshida Mitsuyoshi viz: that he taught how to extract the square and cube roots, leads us to con-

clude that this Yoshida used only the *Soroban*, or ordinary instrument for calculation, because if he had discovered how to extract the square and cube roots, by means of the *Swan-pan*, he must, as every one who knows the *Swan-pan* will allow, have come to the higher roots.

Towards the end of the 17th century, in the period Genroku (1688-1704) Seki increased considerably the Japanese knowledge of mathematics. This individual is still highly honoured by the Japanese; it is said that when he was a child of 10 years of age, he could understand the most difficult mathematical treatise with ease. With the utmost respect for Mr. Seki's abilities, I doubt, however, whether he would have accomplished so much if European mathematics were not at that time so widely known in China by means of the Jesuits.

Seki was the first to introduce geometry into Japan. But we must not understand by this Euclid's system of geometry; this has been a stranger to the Japanese until very lately. The geometry which Seki introduced dealt solely with the calculation of the contents of geometrical figures. He also taught his countrymen the theory of arithmetic.

After Seki, the following were well-known mathematicians: Araki; Matsunaga; Toyoda; Shiraishi; Yosushima Nawomaru; Kusaka; Wada; Uchida. They occupied themselves in teaching the old Chinese Mathematics, as well as in the study and introduction of the new European system, which they learned by degrees from China, or perhaps from the Dutch.

Toyoda, Prince of Kiushiu and pupil of Matsunaga, wrote a work on geometry; Shiraishi, also a pupil of Matsunaga, published a work on Algebra and Geometry. Kusaka lived in the beginning of this century, and stood in high esteem; Wada and Uchida were both his pupils. The latter, now extremely aged, is an Official in the Education Department, and is at the present moment, occupied in bringing out a work, by order of the Government, on the origin of Japanese numbers.

It is difficult to learn anything of the activity of the mathematicians who lived subsequently to Seki. Most of them did not write works for publication, but taught pupils. These pupils wrote down the lectures of their teachers, and these are said to be still in existence, but it is very difficult to procure them. Judging from the information which I have received from several native scholars, the labours of Japanese mathematicians seem to have been wholly fruitless; they can hardly have seized the scientific spirit or the signification of mathematics: on the contrary they seem to have been satisfied with the solution of minor problems. Thus a young Japanese mathematician, to whom I am indebted for much information, and who knows some European mathematics, is endeavouring to solve the problem of the division of a given angle into three equal parts; and he prefers the practical solution which geometrical figures give, to get the side of the pentagon, to the scientific derivation.

The old Japanese, or rather Chinese, mathematics have now but few friends. Young Japan occupies itself only with European Science, and the old mathematics have fallen into neglect. It may also be interesting to know that mathematical science was always a despised one.

I shall conclude with the titles of some mathematical books which are at present in use in Japan.

- Daigen Jinkōgi*. Arithmetic, by Hasegawa and Akita.
- Sanpō Sakushitsu Ruijin*. Equations, by Shiba.
- Sanpō Sokuyen Shijōkei*. On the Ellipse, by Murata.
- Chijōchi Sanpō Sukei*. Surveying, by Kai and Ono.
- Sanpō Shinagu*. Arithmetic, Algebra, Geometry and Trigonometry, by Hasegawa.
- Sanpō Kuiseki Toku*. Trigonometry, by Uchida and Hasegawa.
- Kokogen Shijō*. Trigonometry, by Koshino.
- Sanpō Gakkei*. Geometry, by Saka.
- Tengen Shinagu*. Arithmetic and Algebra, by Sato.
- Sanpō Shinsho*. Arithmetic, Algebra and Geometry, by Shiba.

EDITORIAL NOTES.

THE Ministers and Councillors of State have, since the murder of Okubo, taken the precaution of having their houses and persons properly guarded by soldiers and police. Last night, on the occasion of the banquet given

by the English Minister to them in honour of Her Majesty's birthday—it was remarked, for instance, that all avenues to the Legation were carefully guarded; the grounds surrounding their private residences are patrolled, day and night, by police, and their carriages and those of the Princes of the Blood are always attended by cavalry escorts, of six troopers for the latter, and four for the former. On the roads between the residences of the Ministers and their offices the police have also been doubled. We trust that these precautions will not speedily be relaxed: the country could ill spare another of her leading statesmen as a sacrifice to that blind prejudice which mistakes itself for patriotism.

FIFTEEN or sixteen arrests have been made in Ishikawa *ken*, whence came the murderers. It is improbable, of course, that they were alone in their design: but it is equally improbable that they were representatives of any important body of malcontents. Two local officers are among the number arrested on suspicion.

Concurrently, we hear of a riot in Yamaguchi *ken*, which appears to have originated, like that reported last week from Kagoshima, in the assemblage of *shizoku* to receive their pensions. In this instance, the Kencho was attacked and troops had to be sent for from Hiroshima to restore order. The practice now adopted by the Government in Kagoshima, of paying these pensions through the headmen of the wards where the pensioners reside will, it is hoped, be made universal, and prevent the occurrence of similar disturbances in future.

A NUMBER of changes in governmental bureaux have been necessitated by the loss of Okubo, besides that mentioned last week. Ito has been relieved of the office he was filling of Director of the Bureau for correction of the draft of the Criminal Law, and Yanagiwara, a member of the Genrōin, has been appointed in his place. Ito has taken charge of the direction of the French Exhibition affairs. General Saigo takes the portfolio of Education. This does not appear to us to be a judicious appointment, in one sense—Saigo being a soldier, and a scientific soldier too, but not prominent otherwise, as a literary man.

As a proof of confidence, however, in the Satsuma clan, the promotion of the General to so important a seat in the cabinet is likely to satisfy the people. A number of other changes are made in lower appointments.

WE NOTICE with much pleasure, that quite animated discussions are going on in some of the leading native journals, respecting both of the subjects which we have been writing on so frequently as, we fear, to have wearied those of our readers who do not happen to be interested in the Japan Trade:—the manufacture of Black Tea, and the product of Silkworms' eggs. In our Native Press columns to-day, we quote an article on each subject; and as it is evident that the writers have read what we have written before; we may profitably make a few remarks now on what they have themselves published.

The gentleman who writes upon Tea, in the 'Nōgiyō Zasshi,' tells us that when studying in Vienna, he was much complimented by his German teacher and by a French gentleman, Director of the Agricultural Bureau, on the flavour of uncoloured Japan Tea, and the former suggested the same means being employed to make it known in Europe as was used by the Dutch to introduce Java coffee, viz:—to give packages of it to all shops where tea was sold, with instructions for its preparation. We are not enthusiastic on the chance of the success of this method, and it is possible also that the proverbial politeness of the Frenchman somewhat influenced the criticism of M. the Director of the Agricultural Bureau; but we certainly think that the delicate flavour of first-class Japan uncoloured Teas would be better appreciated on the Continent than in England. Unfortunately, except in Russia, comparatively little tea is drunk on the Continent of Europe, and England is the great market for the article. There, as we know, Japan uncoloured is not in favour, the taste of the tea-drinker inclining him, or rather her, to stronger, rougher, qualities. The writer in the 'Nōgiyō Zasshi' seems to think that efforts should be made to extend the use of uncoloured Japan Tea in Europe. By all means let the experiment be tried as he suggests, in the tea and coffee houses on the Continent:—this would not cost much,

at any rate—but he appears to us to miss the great point of our own arguments, that Japan has to dread the loss of her only existing market—America—and that by improving the quality of her uncoloured tea she should strengthen her failing grasp upon this, rather than seek new markets, or make costly experiments in Black Tea which we fear can but result in loss. We recommend to this gentleman's special notice an article which appeared in the columns of this Review on April 13th, in which was pointed out the danger menacing the Japan Tea trade with America from the direction of Formosa, and forward a copy of the paper for his perusal.

MR. IWASAKI'S most injudicious circular, or report, which we published last month, has, quite naturally, evoked criticism, in every case adverse, not only here, but in China. And it is natural also to expect, that such an apparently fallacious representation of the state of the Company, followed, first by a subscription of half-a-million to the New Loan, and now by a general increase, all round, of freight and passage charges, will excite more and more suspicion, enquiry, and hostile comment. But we must make some allowance for Japanese methods of doing business and forms of speech. And we must specially guard our own selves, too, against exaggeration in the charges we bring against the Company. Having procured a list of the docking done, for instance, to the Company's fleet, we are free to confess that our own accusation that the Company stinted its *whole* fleet of docking requires modification. The subjoined list is a pretty fair one for the six months.

December 1877	<i>Genkai Maru</i>	at Yokoska.
"	<i>Tokio Maru</i>	" Shanghai.
"	<i>Tumaura Maru</i>	" Kobe.
January 1878	<i>Sakurajima Maru</i>	" do
"	<i>Sekirio Maru</i>	" do
February	<i>Kiinokuni Maru</i>	" Yokoska.
"	<i>Tokai Maru</i>	" Nagasaki.
"	<i>Sumida Maru</i>	" Yokoska
March	<i>Akitsuishima Maru</i>	" do
"	<i>Takachiho Maru</i>	" do
"	<i>Urado Maru</i>	" do
April	<i>Wakunoura Maru</i>	" do
"	<i>Yoshino Maru</i>	" do
"	<i>Kokonoye Maru</i>	" do
"	<i>Shinagawa Maru</i>	" Nagasaki.
May	<i>Tsuruga Maru</i>	" Kobe.
"	<i>Nagoya Maru</i>	" Shanghai.
"	<i>Seirio Maru</i>	" Yokoska.
"	<i>Sumanoura Maru</i>	" Kobe.
"	<i>Suminoye Maru</i>	" Nagasaki.

Of these the *Genkai Maru*, the *Tokio Maru* and the *Nagoya Maru* each received a new suit of copper.

Still, when we remember that the P. & O. Company dock all their ships at least twice a year, and those which, on the Bombay and China line, do not get the advantage of an occasional sojourn in fresh water, thrice:—it must be allowed that, for the iron vessels of the fleet, the docking is not excessive.

A correspondent attacks the Company on other points in a letter which we print in another page.

THE article from the 'Nichi Nichi Shinbun' on Silk eggs, advocating our own views that the production should be limited, encourages us to hope that, though Government has removed all the restrictions and petty taxes on the trade, the arguments of those among the merchants themselves who take similar views to ourselves will prevail, and that the production of silk eggs will be checked instead of stimulated. But here, too, though the writer very correctly argues in favour of limitation, so far as he goes,—he fails to see—or at all events clearly to express, the main points on our side. He says in conclusion, very truly, that "the limitation of production of silkworms' eggs is the best system, as it is *directly* advantageous in maintaining the value of the eggs, and *indirectly* advantageous in improving the production of silk and making the silk business prosperous." But the idea that no writer in the native press has yet apparently grasped is this:—that *silk eggs should not be produced for export at all*; that the trade in them should be abandoned; and that, were this course taken, the immediate and certain increase in value, of 25,000 bales of silk, would far more than overbalance the

loss of the profit got in some years upon the sale of eight hundred or a million cards. Unless the Japanese silk merchants themselves stop the egg export *altogether*, their silk, on the other hand, runs a constant risk of deteriorating in quality and price, their best eggs being picked out by the foreigner tempting them with high prices, and themselves left with the refused cards thrown back upon their home market.

IN the third article which we quote from the Native Press to-day,—‘How a Statesman can best secure his position,’—the writer seeks to win over to advocacy of representative government the statesmen who now conduct the affairs of the nation, by showing, to his own satisfaction at least, that the best dependence of a statesman is on popular favour. The article is extremely interesting and amusing to a foreign reader, and must be still more so to the cultivated native mind,—as showing how the severest press laws may be evaded. Certainly this is done in this instance with the most subtle ingenuity. Minister after Minister rises in the mind’s eye, as the writer enumerates the supports which a statesman should *not* rest upon, and even the Throne does not escape covert rebuke. But the writer’s conclusion—that the best support for a statesman is popular favour—shows a touching ignorance of political history, of even current events abroad. Did not the ‘People’s William’ in England,—the idol of the populace ten years ago—have to escape the other day through a back way from his own house in Carlton Gardens, while the ‘people,’ on whose support he rests, were breaking his windows in front, and howling to get at himself? No worse, no more treacherous, no more uncertain support, than the favour of an uneducated populace. We commend to the writer’s careful study the following excerpt from a book less known than it deserves,—‘Gryll Grange’—

“Mr. MacBorrowdale, who had no objection to lectures before dinner, delivered one on all the affairs of the world—foreign and domestic, moral, political, and literary. In the course of it he touched on Reform. ‘The stone which Lord Michin Malicho—who was the Gracchus of the last Reform, and is the Sisyphus of the present—has been so laboriously pushing up hill, is for the present deposited at the bottom in the Limbo of Vanity. If it should ever surmount the summit and run down on the other side, it will infallibly roll over and annihilate the franchise of the educated classes; for it would not be worth their while to cross the road to exercise it against the rabble preponderance which would then have been created. Thirty years ago, Lord Michin Malicho had several cogent arguments in favour of Reform. One was, that the people were roaring for it, and that therefore they must have it. He has now in its favour the no less cogent argument, that the people do not care about it and that the less it is asked for the greater will be the grace of the boon. On the former occasion the out-of-door logic was irresistible. Burning houses, throwing dead cats and cabbage-stumps into carriages, and other varieties of the same system of didactics, demonstrated the fitness of those who practised them to have representatives in Parliament. So they got their representatives, and many think Parliament would have been better without them. My father was a staunch Reformer. In his neighbourhood in London was the place of assembly of a Knowledge-is-Power Club. The members, at the close of their meetings, collected mending-stones from the road, and broke the windows to the right and left of their line of march. They had a flag on which was inscribed ‘THE POWER OF PUBLIC OPINION.’ Whenever the enlightened assembly met, my father closed his shutters, but, closing within, they did not protect the glass. One morning he picked up, from where it had fallen between the window and the shutter, a very large, and consequently very demonstrative, specimen of dialectical granite. He preserved it carefully, and mounted it on a handsome pedestal, inscribed with ‘THE POWER OF PUBLIC OPINION.’ He placed it on the middle of his library mantelpiece, and the daily contemplation of it cured him of his passion for Reform. During the rest of his life he never talked, as he had used to do, of ‘the people;’ he always said ‘the rabble,’ and delighted in quoting every passage of *Huilius* in which the rabble-roust is treated as he had come to conclude it ought to be. He made this piece of granite the nucleus of many political disquisitions.

tions. It is still in my possession, and I look on it with veneration as my principal tutor, for it had certainly a large share in the elements of my education. If, which does not seem likely, another reform lunacy should arise in my time, I shall take care of close my shutters against THE POWER OF PUBLIC OPINION.”

IN reply to numerous enquiries, we have to state that a new novel by Capt. Brinkley will, we hope, appear in the next volume of our Review. During June, our *feuilleton* will contain a short story from the Chinese, by a member of one of the Foreign Legations at Peking.

We excessively regret that press etiquette forbids our reviewing that just concluded; and to add our voice to the chorus of praise which we hear wherever his work is mentioned. Our readers will have even better reason for their applause when we give them the next product of his graceful pen.

WE are requested to state that—several contributions having been forwarded to Mr. Lishman for the ‘Eurydice Relief Fund,’ since the remittance to its Treasurer was made which is notified in another column, together with the subscription list up to the date of its closure on Monday last—it has been decided to keep open a supplementary List for Yokohama and Yedo, until the sums arrive from the Out-ports which are being there collected. The whole amount will then be remitted together to London, and the subscription list duly advertised as the same time.

CORRESPONDENCE.

We do not hold ourselves responsible for the opinions or sentiments of Correspondents. No notice can be taken of anonymous letters; whatever is intended for insertion under this heading must be authenticated by the name and address of the writer; not necessarily for publication, but as a guarantee of good faith.

To the Editor of the *Japan Times*.

[SIR,

The following lines were written in August last, before your journal was in existence, and intended to have been addressed to another paper, in which former letters of mine had appeared; but were not published, as it was hoped the writer might have been in error in previous reflections on the Mitsu Bishi Company. But recent events tend to prove that such reflections were not only justified, but may prove of value to the Company in pointing out disorganization and defects, of which they appear to be in happy ignorance; and I should therefore be glad if you could find space in your columns for their publication now.]

SIR,

In continuation of my remarks upon the Mitsu Bishi Company, I venture to mention some of the data upon which I base my opinion.

An accident which happened to the *Hiroshima-maru*, further exemplifies what I have already stated. This steamer on her last voyage to China, cut in half a large junk laden with oil, just this side of Rock Island, and it was upwards of a quarter of an hour before a boat could be got away from the steamer to the relief of the unfortunate Japanese clinging to the pieces of wreck; during this time the cries of these poor people were most heartrending to those on board the steamer: fortunately it was a calm night, or otherwise the eleven men rescued would assuredly have been drowned. Now I don’t attribute the blame of this delay to the Captain, for he had to remain at his post “forward,” and it was no fault of his that the delay occurred in clearing away a boat, it is only part of the defective organization existing in the Company.

It is all very well to go through a farce of sounding a fire alarm once in a passage, at an opportune moment, which is generally known beforehand by the crew, but in passenger vessels there are other equally necessary precautions to take (as the Mitsu Bishi Company will find to their cost some of these days) such as the life boat station, but to judge from the manner in which the boats of the Mitsu Bishi steamers are secured, it is evident that provision for the expeditious lowering of the boats is not considered of any importance, and simple and effective fittings to meet this object known to every seaman, are either ignored or not understood. Another instance of the prevailing disorganization may be gathered from the fact of the *Tokio maru* passing a lot of wreckage in the neighbourhood of the Goto islands on the

27th of last month, which the officer on watch "did not think worth while reporting to the Captain until some time afterwards." Considering that two large vessels the *Lauderdale* and *Eaglet* were known to be missing at the time, the necessity of watching for any signs of them would have appealed to any but a Mitsu Bishi officer under the present system. I now turn to the case of the officer of the Company who at Kagoshima last month, amused himself by firing at the retreating Satsuma men. Does Mr. Iwasaki think that the tacit approval he has given this transaction will raise him or his service in the estimation of right thinking men, either foreigners or Japanese? As regards foreigners there has been but one voice of condemnation of this act, and I have too high a confidence in the natural instincts of the Japanese character, to believe that it is not the same, with all those whose opinions are worthy of consideration. What right had foreigners to interfere in any manner with the late troubles? It was entirely a Japanese question and those who were actuated by sincere regard for the people of this country, must have looked with regret at the waste of such fine material on either side; the most ardent well wishers of the government could not have helped a feeling of commiseration, for the blind folly of Satsuma necessitating the infliction of such a punishment. But I suppose it will be allowed that the discipline of the Mitsu Bishi must be defective when such a cold-blooded, inhuman, and unjustifiable proceeding is allowed to take place with impunity.

The *Kiushiu* first having gone on to the patent slip in Nagasaki, and subsequently occupied the Pootung dock in Shanghai for some considerable time, it is to be hoped is now sufficiently well repaired from the effects of stranding in the inland sea. It is strange however that this comparatively light draught vessel, with the dock facilities in Japan, should have to undergo all this expense abroad! The *Candia* had her repairs completed at Yokoska, and the Company have had an opportunity of forming an opinion, whether 25 years corrosion on her plating and fastenings, does not far more than neutralise the supposed advantage that the plating of this vessel, originally, was slightly heavier than that of vessels built more recently. This is the only excuse given for purchasing a vessel of the description of the *Candia*, a vessel which when loaded will be unable to enter the Shanghai river except at high water. If thickness of plating is the all-important consideration, I believe that Spain, Peru and Denmark have some fine old thickly plated ironclads which the Mitsu Bishi might utilise perhaps; and besides there is the *Stonewall*, the Kaigunsho would probably gladly dispose of for a moderate sum!

The *Oceanic* was towed from Shanghai to Hongkong by the steamer *Amoy* of about same size as the *Muriel*, for £3,000, about \$15,000. And it does not say much for the condition of the Company's fleet, when a full-powered vessel like the *Muriel* cannot render any service under such circumstances.

The Mitsu Bishi Company appear determined to test the question of demurrage with regard to the *Audacious*, upon what precedent it is difficult to understand; certainly, upon none to be found in the Courts of China or Japan. I have instanced one or two cases in point with the object of saving them from making a greater mess of it than they have done already, and I conclude this letter with a few others.

1.—The *Mona* and *Agamemnon* collision, tried in Singapore in 1868, in which the *Agamemnon* at first claimed \$86,000 including demurrage, and eventually after appeal got about \$22,000.

2.—The recent case in Shanghai of the *Hopeful* and *Annie Grey*, one vessel being actually on her voyage tea laden, and not in the unserviceable condition of the *Chihli*. If the Mitsu Bishi Company are obstinate enough to expect to obtain more than what English vessels can obtain in accordance with their own laws, they will have only themselves to thank if they experience further humiliation. I propose to discuss the question of seamanship involved in a vessel riding by one anchor with long scope of cable in preference to two anchors, and confidently leave to the opinion of those capable of forming one on this subject whether I succeed in establishing that by practical experience the former has proved to be the most advisable course to adopt.

Apologising for taking up so much of your valued space, but pleading that the subject is worthy of discussion.

I am, Sir,

Your obedient servant,

19 August, 1877.

YOKOHAMA: SATURDAY, JUNE 1, 1878.

NOTES OF THE WEEK.

FRIDAY EVENING, May 31, 1878.

WE HAVE, this week, but little mail intelligence to record. The *Sunda*, bringing the English mail of April 12th, arrived on Saturday last. The *Twe*, with the homeward French mail, due in London July 22nd, left on Wednesday. The *Belgie* is advertised to sail for San Francisco on or about the 7th proxo. The *Hiroshima Maru*, for Shanghai and ports, sailed on the 29th. The inward steamer from Shanghai is behind time this week, but is expected to-morrow morning. An outward and inward mail from the Northern ports have arrived and departed.

The news from home, in both public and private telegrams, have been this week far more pacific than for months past: due to Lord Beaconsfield's vigorous policy, displayed immediately on the secession from his Cabinet of the son of his old chief. How many of our readers, we wonder, retain any recollection of the old impetuously driven "Derby Dilly" with its 'six insides,' which furnished so familiar an incentive for our fathers' mirth. And to think that the son of that chivalrous Jehu should have dropped into the position of the 'drag' and finally been discarded as the 'fifth wheel'! The *Celestial Empire*, which has, since it passed into fresh hands, suddenly sprung up into the position of a first-class weekly paper, most happily compares him to Harley, the 'safe' man of Queen Anne's time, and, aptly reversing Tennyson's fine lines:—

'And many a darkness into the light shall leap,

And shine in the sudden making of splendid names.'

draws attention to the as sudden fall in the estimation of their countrymen of both Gladstone and Lord Derby. Ties of gratitude and ancient traditional friendship prevented the Premier from dismissing his Foreign Secretary, but the impulse given to England's step in the march of events has been very markedly shown

since his most welcome retirement. Lord Salisbury's magnificent despatch, breathing in its every line the spirit of an ancient name-sake's

'Come the four corners of the world in arms,
And we will shock them. Nought can make us rue,
If England to herself do but prove true.'

has completely changed the complexion of affairs in Europe. The utter imbecility of Prince Gortschakoff's reply indicates complete collapse of the Russian aggression:—the last card appears to have been played in her game of 'brag,' the Treaty of San Stefano must be torn up, and England's interest will be assured, and her position asserted in Europe, apparently without the cost of war.

Our little friend the *Choya Shimbun*, by the way, who may thank its suspension for escaping severer handling from us, receives a very sufficient reply to its call to England's subjects in India to revolt, by the news to hand by last mail of the enthusiastic rush to the standards of our Indian soldiery when the call to arms was heard. In a fortnight, a complete division, perfectly equipped, of all branches of the service, was despatched from Bombay, and throughout the country, the only murmur that is heard is from the multitude who have not been so lucky as to be chosen for service. We fully believe that the precipitate change of front just made by Russia is due, in no small measure, to the movement of this minute contingent of our enormous Indian reserves. Lord Beaconsfield is one of those great statesmen who dare to give expression to original ideas: and, though carped at and ridiculed at the time, Englishmen now see the value of his Proclamation of Delhi, announcing the Queen's ascension of the ancient Imperial Throne, and of the Progress of the Heir Apparent through the Empire. Small the danger which has now to be feared from Russian intrigue by the English *raj*, for at least the next generation.

But here we are again, most improperly in so cosmopolitan a community, expressing our views on great European questions, when we should be 'babbling of green fields'—anticipating cricket matches, recording lawn-tennis handicaps, and savouring strawberries and cream!

We are glad to see active training going on for the Regatta of the 8th of June; and with so many men-of-war in harbour, a good many well-contested cutter and gig races, and also a number of interesting sailing matches may be looked for. We must pray for better weather than this while we write: but the Sou'-west monsoon has apparently come up higher than usual this year, and a wet summer is predicted by our meteorologists. The competitors in a race of another sort and of greater interest are just starting from China to London, by the way: the steam tea-clippers. The three favourites are the *Glenaeagles*, the *Loudoun Castle*, and the *Ocean King*. The *Glenartney* and *Hankow* are also competitors, but not so much fancied. The *Glenaeagles* last year disappointed her backers, but her bearings, the heating of which threw her out of the last race, have all been replaced, and her party is very confident. The *Ocean King* has been built specially to win this year's contest, and her 'preliminary canter' out,—from Greenock to Woosung,—having been done in the fine time of 37d. 19h. 10 min. and 48 sec., she will take a good deal of beating. The *Glenaeagles* has got away first, we see; passing Woosung buoy at 11.10 a.m. on the 25th. The *Loudoun Castle* was to follow in twenty-four to thirty hours. It is a common defence to set up for horse-racing, that it tends to improve the breed of horses; but certainly tea-racing improves the build of ships!

Pilgrimage's performance, winning both the One and Two Thousand Guineas, is very remarkable, till we hear what sort of cattle she had to run against. Who will win the Derby, we wonder, next week? *Apropos*, we try to lighten a rather heavy number this week, full of finance, mathematics, commercial tables, and Japanese municipal matters, by a clever sketch of our great English holiday, from the Victor Hugo point of view; which will be found below.

Our own municipal misery occupied the attention of a sort of international secret 'caucus' last Wednesday afternoon; but as we were not honoured by an invitation to assist at the conference, we can only tell our readers that a scheme was drafted, which will, in due time, be submitted to the Consular Board, and thereafter, we presume, to the ordeal of a public meeting. We wish its concoctors all the success they deserve. Another impudent robbery has again demonstrated the impotence of the existing police as guardians of our property, and rumours of cholera are just beginning to be heard, to expose the deficiency of our drainage and sanitary systems; while pitch-dark streets, and road materials pitched down anywhere as man-traps for us to pitch over, excite us to 'pitch into' the existing incapables, and as urgently stimulate us to cry:—'Reform, Reform!'

Quite a multitude of Notes' are on our file, of which we must make short work. An odd ceremony in honour of the silkworm, or propitiation of Fortuna for the coming season, was to be witnessed last Wednesday at the Daijin-gu temple on Isayama hill. An altar was set up, the usual offerings made, and a *gratis* theatrical performance and exhibition of fireworks given, to the great entertainment of a large crowd, and let us hope, to the improvement of the prospects of the new crop. To-morrow a cricket match will be played, weather permitting, (which now, 1.45 a.m., doesn't seem to be in the least likely) between two elevens, representing respectively the Club and the Fleet. Admiral Patterson U.S.N. and staff arrived on the 29th inst. in the *Monacacy*. From China comes still the same terrible tale of famine in the North; the details are becoming so sickening and the state of the country is so utterly hopeless that we refrain from quotation or comment. From Hongkong, Englishmen are glad to hear of the harbour and town being put into a perfect state of defence, and, *pace* the *Japan Herald*, the Governor is showing himself quite the 'right man in the right place.' We have not yet heard of the *Shannon's* arrival at Hongkong, but she was at Penang on the 4th inst. and cannot be far off, to be immediately followed by other accessions to the China fleet. Silk and tea merchants have nothing to fear from Russian cruisers in these waters in the now happily, improbable event of war.

Old China residents will be glad to hear that Archdeacon Grey late of Canton, has been honoured by Cambridge with the degree of L. L. D. His long talked-of book on China is just coming out. General Le Gendre, by the way, has in the press, we hear, a book on Japan, which is to appear in August. We look forward, with pleasurable anticipation, to the opportunity of reviewing it.

How short is our Japanese spring! Hardly have we time to enjoy the delicate, tender shades of various greenery, before all the foliage rushes out in full summer livery. And so in the fields, too! The barley and bearded wheat are ready for the sickle, rice is almost all set out, and the rape has long lost its bloom. We miss the hayfields of our fair English June, though, and even the fragrance of the new-fired tea hardly equals, though we thank it for re-calling to our sense, a perfume with which are associated so many of our happiest recollections of childhood and of home. It is not in Japan that we can sing:—

'The bloom of hawthorn's past and over,
But fragrant is the purple clover,
And June is joyous to the lover

By night and day.
And bees are drinking honey-wine
From scented cups of eglantine—
And mortals think the weather fine
For making hay.

'The wandering poet takes his tithe
Of music from the sweeping scythe,
Of merry maidens laughing blithe

In love's sweet way:
He mirrors in his magic glass
The meadows wide, the fallen grass,
And thus it clearly comes to pass—
He's making hay.

'O make your hay while shines the sun!
For soon the fragrant days are done,
And eyes and lips of love and fun

Glide swift away:
So if you're in a state of "spoons,"
Just take this jolliest of Junes,
And give its indolent afternoons
To making hay.

'White lilies sleep on th' upper Thames,
The chestnuts shed their diadems,
The sultry summer's rarest gems

This month will stay;
Sweet sings the thrush; the cooing dove
Is heard in woodlands far above:
Ah! what's more sweet than making love
And making hay?'

[We cannot afford a special wire to bring us an account of next Wednesday's Carnival on Epsom Downs; but in our commonplace book we find a description of one by a French gentleman visiting London which our readers may perhaps find amusing.]

REALITIES OF THE DERBY.

By A FRENCH VISITOR.

I. SELTERS-WATERS OR B. AND S.?

After Light, Shadow; after Pleasure, Pain; and both inevitable oscillations of the pendulum of life!

Alas, to wake—it is to remember, and to remember is to repent.

Last night, I banqueted with the merchant-princes of London and with the ancient nobility of Wales; the leaders of the Fashion

World, the Sport, the Turf, the boxers of the most renowned, the comics of the musical saloons—Lord Ouiggins signalled them all to me. Foaming, sparkling, vivacious, the wines of Champagne led the way for the stronger Grogs. A vision, confused indeed, but magnificent in its confusion, will long recall to me the night before the Derby.

I awoke.

Sad and supreme moment of mortality, when awakening means isolation!

For some time, I knew not where I found myself. Presently, as the dim light of the dawn penetrated, first through the folds of the fog, and next through the dirt of the windows, I recollected that Lord Ouiggins had advised me to stay with him at a fashionable hotel, adding that his own drag would call for us in the morning. Ah, there is still remaining, then, a little of the true old Britannic hospitality! Democrat myself, let me not be unjust to the noblesse.

It was still of a good hour. I turned myself to sleep; but heard, with dreamy ears, the fall—or so it seemed—of cataracts of rain, around me, beside me, overhead. The sound gave me a strange sensation of thirst, which I cannot otherwise explain.

Instinctively, I rang the bell, and shouted "Selters! Selters! Selters!"

A tap at my door; and Lord Ouilliam, in half-toilette, appeared. I saluted him.

"Is it that the rain will make to be deferred the Courses?"

"What rain?"

"Listen, then!"

"That? why, it's only the men tubbing!" (idiom untranslatable.)

"What did you ring for?" pursued Lord Ouilliam.

"But, for Selters then!"

"Tout droit," he rejoined. "*Vous étiez horriblement coupé, mon ami; bien roide!*"

Strange and picturesque argot of intoxication: "awfully cut," "very tight."

"Listen," continued Milord. "my carriage is not yet arrived. It has probably been stopped by the Thames Embankment, which is to run outside my park at Ouapping. Look you, I will take places for two, outside an omnibus. It is the usual plan amongst the nobility. Admiral Rous will be one of us. You may easily know him by his wearing a white hat, a veil, a flower in his button-hole. Meanwhile, better not have Selters. Try B and S?"

Enigma, of which the solution—when it came—was far from disagreeable.

II. LUX.

The morning at first was dull and brumous. The *spleen* of Britannia seemed to possess me. I had atrocious pains in my head. Every noise bore upon my nerves. The very sight of food seemed to nauseate me.

Lord Ouiggins, on the contrary, made a breakfast of the most substantial.

I cannot say much in favour of the cuisine at this fashionable hotel, one of the first in London, the well-known "Spotted Dog" in the aristocratic quarter, Route de la Chapelle Blanche (White-Chapel-road), the Faubourg St. Germain of London. Strange: the hotel is not mentioned in any of the ordinary London Guides.

Ray by ray, sunbeam by sunbeam, the morning advanced. As the herrings of Yarmouth vanished from the table, the sunlight pierced. Light! For the captive in the dungeon, for the sailor on the deck, for the noble *sportmans* on the omnibus, Light equal, impartial, beneficent! To the *trainer* in his stall, to the outcasts sleeping on the Downs, to the patrician in his lonely *tub*, the Light appeared, the promise, the herald, the messenger of Joy.

For once, the social distinctions, hard as iron, of the Old England break down; for once the Noble Lord rides on the *knife-board* with the proletarian. The baronet salutes the butcher. Deep calleth unto deep. Sublime Democracy of Sport, victorious Equality of the betting-ring.

We take our places. The best seat is reserved for the Admiral—that famous old warrior, who turned the fortune of the day at Chillianwallah by his historical charge at the head of the Naval Reserve and the Royal Horse Marines. Combination eccentric, but not without precedent. The horse was sacred to Neptune. This Rous, see you, this Admiral so passionately equine in his tastes, he is Jean Bart and he is also Murat; he is Kellermann and he is also La Pérouse! All the great men touch, and recognise one another!

The light still brightens. Behold us then effectively departed!

Hoorrah! Hep, hep, hep!

Vive Ventre-Tambour!

III. NOTHING IS CERTAIN TO HAPPEN BUT THAT WHICH IS UNFORESEEN.

We have gone a few miles on our road, still through the streets of the fashionable quarter, to-day as democratic as the Faubourg St. Antoine, and crowded with other Derbyites, before we speak

much to each other. Reserve characteristic of the oldest and proudest aristocracy on earth.

At length Lord Ouiggins whispers me—

"I knew I had forgotten *something*. I've left my purse on the piano!"

For the moment I wished that I had done the same.

Suspicion dishonouring and ignoble!

IV. SI JEUNESSE SAVALT.

Fog, obscurity, cold—yes, you will find them all in the climate of Great Britain; in England, in Scotland, in Ireland, and in the mountains of Wales, the cradle of Lord Ouilliam! It is true. But it is not the only verity. Great Britain also has her moments of fine weather. There are no such trees in the world as the tall poplars of my own, my beautiful France—none planted in such mathematical, such symmetrical order, so methodical, and straight. Nevertheless, Nature is infinite. Even the chestnuts, hawthorns, lilacs, and laburnums of the Surrey lanes are not absolutely offensive to the eye. To-day, also, Phœbus pierces. *Lux!*

There are no women in the world like those of Paris; but there is still a present freshness in the faces of the young pensionaries who watch us, at times, over garden walls. To several of these, I kiss my hand. They smile, in reply. Laugh, rosy daughters of Albion, laugh; for it is still day, and you are young—too young for reverie. The hour will come, perchance, when pensive and full of a vague desire for wider sympathies, for nobler aspirations, for keener emotions, tired of the school, tired of the domesticity, tired of the compliments—trivial, pale, and faded—of the phlegmatic young Milords, you will return in fancy, chaste but mournful, to the child of France who saluted you to-day. You will sigh, but you will sigh in vain. "Our hearts are not our own to give." Ballad by the poet Tupper. Oh Finette, my little kitten! . . .

V. WHEN POVERTY BECOMES IRONICAL, LET WEALTH TAKE CARE.

The old Britannic *humour*, as exhibited in Samuel Benjamin Johnson, in Jonathan Smith, and Dean Sydney Swift is not absolutely extinct upon the road.

More than one little Arab of the highway shouts out to me, "I'll have your hat!" Wild caprice of the imagination, playfully misrepresenting the probable eventualities of the future, and yet, at bottom, profound, almost terrible—a mockery, yes, but a menace—a jest, without doubt, but a threat also—the voice, grotesque but strident, of the *Miserables*. Reflect. To-day they only laugh at Property; to-morrow, they may insist on sharing it.

I impart these reflections to Lord Ouiggins. Alas, to what good? The pride of his class is too strong for him. His natural instincts are noble; but he is spoiled by the mephitic atmosphere of the Upper Chamber. With a laugh cold, sardonic, and glacial, he replies—words of ineffaceable significance, typifying the gulf between the Nobles and the Poor—

"Throw the little beggar a copper, and let him go!"

He does not even, generous though he is, offer to provide the copper.

Again ignoble suspicion! I forget that he has left his purse on the piano!

The Arab—delirious with joy—saved, perhaps, from starvation by the casual bounty of a foreign *sportmans*, would fain express his thanks. His emotion overpowers him. He staggers; horror, he falls! No! again! Gallant child of Poverty, the struggle is vain. Once more he wavers, he oscillates, he falls, and turning wildly head over heels, in the convulsion of his death agony, he disappears in a cloud of dust—doubtless to be driven over by the omnibuses of the haughty and the phaetons of the Stock Exchange!

Shocked, but masking my horror under the veil of a politeness a little cynical, I say to Lord Ouiggins.

"And well, then, Milord, did you see what he did? and do you know what will be his fate?"

Question terrible!

He does not even remove the cigar from his mouth, this impassive patrician, as he answers, with a laconism which lacerates, which vibrates on my nerves, which almost makes me bound, "*Yes; cart-wheel!*"

VI. LONDON AT EPSOM.

Dust, heat, emotion—all stimulate thirst.

I soon forget the little Arab. There are plenty of others remaining. There are worse things in the world, too, than bottled stout. Lord Ouilliam tells me that none of the aristocracy now drink champagne in public. It excites a feeling of envy among the lower orders. On Derby's Day, the populace gives the tone to the peerage. Most of the Marquises on our omnibus drink beer, and several of them have brought pies, made from the celebrated hunters of Melton Mowbray—hippophagy expensive, but characteristic of Britannic humour. The Admiral is a humourist of the most

extravagant. He has only brought a little gin and water in a bottle, and some ham sand wiches in a copy of the "Saturday Review." It is this readiness to accept the popular customs which had made him the idol of the crowd.

The crowd; my faith, and what a crowd! There are two things in the world which a man never forgets: his first sight of the sea and his first sight of the multitude on Epsom Downs!

There is another thing which some men never forget! I know I never shall; it is the first voyage over the Sleeve!

What a sound, as of ocean! What infinite discords, subdued, by very force of number and of contradiction, into one sublime monotone! What minstrelsy, cosmopolitan and comprehensive—the audible expression of a Colonial System unparalleled in grandeur and extent! The Hindoo may think in his heart of the days when he fought for his country's municipal freedom under the banner of Rammohan Roy and Nana Sahib; but look! Plaintively submissive, he strikes his *tom-tom* to amuse the destroyers of his race. And yonder—Africans—swarthy descendants of Jugurtha, they forgive the atrocities of Governor Wilberforce as they dance around to the merry strains of the banjo and the tambourine!

VII. MESSIEURS, FAITES VOTRE JEU! LE JEU EST FAIT!

"Would you like to see the horses a little nearer?" says Lord Ouiggins. "You had better buy a couple of tickets for the padwick." I do so. The Padwick—so called after an eminent British sportsman—is an enclosed space in which the true connoisseurs survey the horses before they start. As I gaze at *Ventre-Tambour*, I can hardly refrain from shouting, amongst all these impassible patricians, "Hourrah! Hep, hep hep!"

Lord Ouiggins comes to me, hurriedly and whispers. "Hush, I have just got the straight tip from the Admiral himself. It's a moral; and the horse at twenty-five to one! We must get on every sou we have. There is barely time before they start. Quick." I hand him my purse—not without a moment of hesitation—of which I am speedily ashamed.

VIII. RIEN NE VA PLUS.

A minute sometimes seems like hours. Fortune was in my grasp. The interval of suspense was horrible; and yet its termination, when it *did* come, seemed abrupt, sudden, incredible.

I was still struggling with the crowd, when a hoarse sound suddenly rose like the roar of a tempest on a rocky coast—it rose, and rose, and grew stronger; I looked; I saw a wonderful white flash of faces as the multitude turned all, in one instant, one way; and my pulses seemed as though they would kill me with their throbbing as, with one voice, that innumerable assemblage cried—
"THEY'RE OFF!"

IX. THE WORD OF THE ENIGMA.

They were indeed; and so was Lord Ouiggins of Onapping!

THE JAPANESE PRESS.

THE SILK EGG TRADE.

(From the 'Nichi Nichi Shimbun'.)

A CORRESPONDENT writes to the *Nichi Nichi Shimbun*, an article entitled; "There should not be a limit put to the production of Silkworms' eggs," in which I observe that he argues that "to limit the production of silkworms is simply for the purpose of profiting producers." This surprises me. What is meant by "the profits of the producer?" Considered from a view of the whole argument, it would appear that he means to say, that the decrease in value in silkworms' eggs is owing to their quality being bad, and that if the production were limited, it would only result in profiting inexperienced producers. But I consider that unless the production be limited to a proper amount, it is impossible to maintain profit, and that, however, good the quality of silkworms produced, if the supply exceed the demand for home and foreign use, and is left unsold, we cannot but allow the excess to putrify wastefully. How could I possibly agree to this being unharmed to the profit of the country? My decided opinion is that excess of production is the cause of loss, and that limitation is not a system which only profits a few producers, but is the best system for protecting the general profit of producers throughout the country.

My opponent says:—"Whatever limit may be put to the quantity of production, unless unskilful producers can be made skilful and inexperienced made experienced, it is beyond hope that all the silkworms should be of equal quality"—as the quality of the silkworms is of course different, limitation is not for the purposes of equalizing the

different qualities of eggs, but it is simply for increasing the value of those of good quality more and more, and for maintaining the value of even those inferior. He also says that "although silkworm's eggs of the best quality would of course be sold at once, even those of bad quality would, although not admired, as there would be no better quality to be got, have to be bought by native and foreign merchants, &c., &c." From this it would appear that he means to say that producers of the bad quality would, as they obtain profit, become careless in their production and produce a worse and worse quality, and it is rather better that they should sustain loss and ruin themselves—but I consider that an improvement in quality is produced from getting profits, and if they have to throw the eggs into the fire or water again this year, the producing business would be crushed and it would become impossible to obtain even the good quality.—If fortunately, as he says, the best quality were sold at once and even the bad quality were bought, this being a step towards the improvement of the quality and the origin of the country's profit, he should take the side of limitation.

He thinks that "the limitation system only ends in giving a profit to a few producers and all the others throughout the country have to sustain great loss." This again greatly surprises me. Although, as he plainly says, unless a good seed be sown, good product can not be obtained, (this being a natural and acknowledged fact) and a bad quality of eggs must cause great loss to the silk manufacturers: if the silkworm eggs lose their value for successive years, who would pay attention to the production and endeavour to produce good quality? The quality would thus become worse and worse and finally the production would cease. Again, to say "when we consider 1,000,000 cards a sufficient and suitable quantity, we produce 1,500,000 cards and employ the best quality picked out from among them, we shall be able to obtain the best worms for the country;" this is an opinion which may be formed, but it is impossible to put it in practice. Did he not say that "silkworm eggs of the best quality would of course be sold at once." Should it be really so, the eggs of good quality would all be bought by foreigners, and the bad quality would remain in excess, and the native silk manufacturers, being unable to obtain worms of good quality, would be obliged to use bad worms, and thus the quality of our silk would, as he regrets, become worse and worse. Whereas, on the contrary, if the limiting system were adopted, it would enable the egg producers to obtain a profit, stimulate them to improvement, and by making a distinction between the home and foreign use, would protect the excess export of good eggs.

Again, this writer says:—"If the system of limitation were adopted, and 1,500,000 cards were manufactured, of which 1,000,000 be taken for the requirements of the country, then, if at this time, foreigners should require to buy 1,000,000 cards at once, the requirements of the country would suffer." I consider that the silkworms' eggs going out excessively to the foreign countries and home requirements suffering, is the result of free production, rather than of limitation, because, in order to establish the limitation system, we must duly consider the advantages of the business and the amount of the home and foreign requirements, and then put a limit at a proper and suitable amount, strictly distinguishing those for home use from those for foreign exports. Then there would be no fear which we need entertain as regards the amount of exports being excessive and home requirements suffering; but it is not so in the free production. If egg producers consider the egg producing business unprofitable, they may either decrease the amount or cease production, and if, at this time, foreigners should require a large amount of silkworms' eggs, our merchants would, only looking to the high price, sell them to the foreign merchants, and thus the requirements of the country would suffer greatly. He further says that: "If it happens that the egg growers, after having grown a great quantity of silk eggs, unfortunately meet with the loss of throwing them into the water or fire, it is only a temporary injury, &c., &c." but I believe that, this loss would decrease their courage and check their emulating each other for improvement, which he so warmly wishes for, and he the cause of producing bad silk, and thus run a great risk of losing the good reputation and value of our country's chief staple. Consider that silk eggs are the origin of silk, and how could the silk possibly be good, if the egg growing business declines? He again says that "the system of limitation is

"far beyond the province of Governmental interference and "is rather near to oppression, &c., &c." This surprises me and I doubt its correctness. If the members of the silkworms' egg business Association, publicly appointed by the egg producers of the whole country, should approve limitation, would he still take it as interference or oppression?

I firmly believe that the views of the members of the S.E. Association are the views of all the egg producers of the country, and that what has been decided by them is indeed what is best for the whole trade, and is an impartial, just, and good system.

I consider that the limitation of production of silkworms' eggs is the best system, as it is *directly* advantageous in maintaining the value of the eggs, and *indirectly* advantageous in improving the production of silk and making the silk business prosperous.

TEA.

From 'The Nôgiyô Zasshi,' (an Agricultural Review.)

IN THE preparation of tea, there are three great distinctions made, *i.e.* Black, Green and Uncoloured teas. The uncoloured tea is prepared generally all over our country and the black and green are mostly prepared in China, and India. Now, considering in which countries in Europe and America these teas are employed, and as to which of these kinds are used, we find black and green teas mostly liked and employed in all the countries of Europe, whilst the uncoloured is only liked by the Americans and, even in America, in some States it is not so much liked as in the others. For instance, if we take a steamer and sail eastward from Yokohama harbour, we reach the port of San Francisco (or the western part of America), and find that the natives there use our uncoloured tea for daily drink, and thus it is their custom that, when a guest makes a call, they, without asking him what kind of tea he likes to take, offer him uncoloured tea. But in New York &c. (or the eastern part of the continent) the natives, when receiving a guest, always ask him first whether he likes uncoloured or black tea, and then offer what he prefers. Now if starting from this place and sailing again eastward across the Atlantic ocean, we reach London, the capital of England, and put up in a hotel and there order tea, what they instantly bring is nothing but black tea. This is merely owing to our uncoloured tea not yet being employed in Europe. The writer, during his stay in Austria, used occasionally to present his European teacher with the best Japanese tea, and he, appreciating its taste very much, invited, one day, a gentleman who was the Director of the Agricultural Bureau of France and offered him the tea to try; this gentleman equally appreciated the taste very much, and said that a tea of such flavour could not be obtained, though he were to search for it all through Paris. Further that he thought if Frenchmen tasted this tea, their admiration and demand for it would be much more than those for the black tea which they had hitherto been accustomed to. My teacher afterwards said that "the fact that, although such a good tea is produced in Japan, it is not used in Europe, is owing to the custom being to drink black tea only and that even of tea merchants, but a very few of them know of it, and further, as this uncoloured tea is not being introduced into Europe, some measures should be taken in order to let Europeans appreciate and use it. And as he knew of a means by which the Japanese tea might come to be employed in Europe, he would tell me." He went on to say that "in ancient times, in Java, a Dutch territory, although a very good and cheap coffee was abundantly produced, as there was no demand for it from Europe, as being somewhat different to that produced in Arabia, the Government of the former, regretting this, adopted a curious means—which was that it appointed agents in all the thriving cities and towns of Europe and let them supply a pound of the coffee to all the shops where coffee was sold and the drinking houses where coffee was prepared and sold, with information as to its price. Then the demands for the Dutch coffee increased at once in all parts and all the coffee used in Europe came to be sent from the Dutch territory, and indeed it has now become so great that it would not be too much to say that that country has taken up the whole ground of the coffee trade in Europe." Now no means to introduce into Europe a taste for Japanese tea, which has so good a flavour,—could be better than this.

The preparation of tea in our country having been, so long, actually practised, there are many in the country who are well acquainted with the mode of preparation, and apprecia-

tion of our tea should not be limited to Americans only. As mentioned above, if we endeavour to improve the mode of preparation of our own tea and adapt the means as suggested by my European friend, in order to extend its use throughout Europe, this would not be a difficult matter; without striving to establish the system of preparing black tea which is so new to us, and which must come into competition with that of China and India. What we should rather aim at is to export a great quantity of our uncoloured tea to the continent of Europe. But it would appear that, until after we have determined clearly the question whether it is more profitable, to make black tea with our tea leaves, or to strive to introduce them into Europe as uncoloured tea, we cannot conclude whether striving to prepare the black tea is profitable or not. Reading over an article which appeared in the foreign paper *Japan Times* published on the 23rd March, arguing the question of profits of our preparing black tea—we find there several points in which we agree with the writer's opinion; and also some at which we cannot but be depressed. We therefore briefly translate the main points of the article and ask the opinion of the public thereon;—(Here follow translations of Editorial Notes on Black Tea making in Japan from p.p. 240, 241 of the *Japan Times*.)

From what the Editor of the *Times* argues, black tea making is very unfit for this country; and as those who prepare tea largely in our country have for 2 or 3 years been out of profit and indeed some of them are ruined on account of the tea-plantation, it may be possible that they, on consideration of the past, may conclude that they cannot expect any profit either by making their tea into blacks or preparing them as hitherto. But the tea is not an unprofitable business, for instance, look at the yearly increase of its use in all countries of Europe, and the increase of its use in America. The fact that, although the use of either black or uncoloured tea is not at all decreased, yet our countrymen are unable to gain profit from the preparation of tea, seems to have, as the editor of the *Times* says, originated from our merchants' having lost their credit, and also there having been some who, at the time when there was a sudden fall in price of the tea, became careless in its preparation. Should we not, in the present time, not only restore the trade from this decaying state, but make it more and more a great production of the country? Now leaving the question of the preparation here, we will give a plan of the machine used for preparing tea by Englishmen in the tea districts of India. Its shape is as under-shown and it is said to prepare 25 maunds in a day, and a maund being equal to our 80 kin, 25 maunds is equal to our 240 Kwamme. The quantity prepared with one machine in a day is as great as this—and therefore that Englishmen who are preparing tea in the districts of India should be gaining great power over the European tea trade, is not a remarkable matter. But this tea-preparing machine is now already in our Government Department of Industry under the charge of Mr. Ishikawa Masatatsu, who is actually employing it. Is not this fortunate for us? This machine is very advantageous for preparing either black, green or uncoloured teas, and the tea prepared by means of this machine is also very good. Now it is our earnest wish that we should in a great measure make machines in imitation of this, employ them widely, increase our tea-production, obtain better and better reputation therefore, and induce our teas to be widely employed in both America and Europe. What have the tea-growers of our country, to say to this?

(Here follows the plan of the machine).

HOW A STATESMAN CAN BEST SECURE HIS POSITION.

(From the 'Hochi Shimbun'.)

FROM old time until now, there seem to have been always five methods by which a statesman can assure the permanency of his power:—(1) produce upon popular favour; (2) on military force; (3) upon his Sovereign; (4) upon the Princes of the Blood; (5) upon the Sovereign's mother or female favourites. These means of support are all uncertain in their value, and the permanency of a statesman's power is more or less insecure as he leans on one or the other. A first sight of a man, observant of the signs of the times, is he who is the strongest, and thereby secures himself a man not filled with such powers of observation and discernment, attaches himself to a party or a person, without observing how fitted is his power, and therefore falls. Thus it is evident that the se-

curity of a statesman's power depends entirely upon the means he selects for his support.

What is dependence upon popular favour? This is the reliance, by a man whose whole heart and soul are devoted to the protection and advancement of his countrymen, and whose bravery or talents gain their esteem,—upon the good will of the people, who, in their turn depend and rely upon him. No matter whether he be in office or in retirement, the people look to him in any time of change or danger to the State. A statesman thus supported by public opinion is most powerful, and even when he retires from office, yet his influence remains; and thus enjoying power, is in security himself and his family is established. As, however, a statesman will not receive this sort of support unless he be upright, honourable and intelligent—all men engaged in public affairs should strive to obtain it.

For all other means of support are bad. What is dependence upon military force? This is the support given to a man who retains his position by favour of the soldiers and officers under his control, and who would sacrifice their lives to retain his position; or it is the state of a man who holds a high office in the central Government of his country by virtue of the military power of a single *ken* or *han*, which is under his control. Supported thus by a great and powerful force, the influence of such a statesman must needs be great;—but, in the event of this force being disbanded, his power and influence would immediately sink to nothing, and himself into insignificance. Such power is evidently not permanent. Then, what is the value of 'dependence on the Sovereign'? This is the support of a man who has luckily gained the confidence of an intelligent monarch, who approves what he says and contrives, and trusts implicitly to him; or who gains the favour of an unintelligent, young monarch, by providing for him pleasures of luxury and sensuality. But intelligent monarchs do not always exist, and the favour of an unintelligent sovereign is difficult to keep, and such a master is always ready to believe slander. This, therefore, cannot be regarded as permanent support, and a statesman who depends on his sovereign's favour is surely insecure. What then, can we say of 'dependence on the Princes of the Blood'? When a monarch is young or incapable, and there is no great Minister to control the State, government is sure to lapse into the hands of the near relatives of the crown, and some statesmen try to attach themselves to these, and so rule through them. In the same way, the male or female attendants of a weak prince often acquire great influence with him, and govern the people thus indirectly—to their own great profit and increase of wealth and dignity. But a statesman who should join himself to such, or to Princes of the Blood, cannot but fail.

But a statesman must have something to depend upon, some power to support him. We have shown the folly of depending on military force, the favour of the sovereign, influence of the royal family, and palace intrigue. What support then should a statesman seek. Clearly the support and favour of the people. And then comes the question: How is such support to be got? We reply: the only means is the establishment of a National Parliament. If the great power of framing laws were entrusted to the people, and to statesmen and Ministers were reserved only the duty of carrying out the people's wishes—the executive power, then a statesman might obtain the people's support. And though this may, at first sight, appear to be cutting off half a Minister's power and to be giving it to the people, thus diminishing his influence; this is not so. His position would be made so much more permanent and secure by the support of the people, that it would redound much to his advantage.

The above argument is mainly devoted to the consideration how Ministers may retain their power, but it involves also the best means to secure the safety of the country.

EXTRACT.

NOTES ON JAPANESE ARCHITECTURE.*

By JOSIAH CONDER.

(Concluded from our last.)

The temples of Japan are by far the most interesting and instructive buildings to be found in the country; set in the solemn shady quiet of their thick groves, approached by their avenues of

lamps both stone and bronze; with the grand sweeping lines of the roofs projecting boldly forward, upheld by a profusion of brackets; wooden carving tastefully disposed, sharply and beautifully cut, and the whole woodwork often decorated in well harmonised colours with gilding and bronze ornaments. The principal temples are to be found in Nikko, Kioto, and Tokio (or Yedo.) The two principal groups of temples in Yedo are at Ueyeno and at Shiba, and at both these places the large central temple has been destroyed by fire. The subsidiary temples, however, are so numerous and imposing, that these sites still rank first in importance in the city as temple groups.

The temples at Shiba are enclosed on three sides by a long wall with several gateways at intervals, and backed by a thick wood of fine old trees. The streets surrounding the walled sides consist of a continuous avenue of pine trees, interrupted only by one large and two small gateways forming the approach to the sacred grounds. The principal entrance is a large and imposing wooden structure some 70 feet wide and of about the same height. It is built upon heavy wooden pillars arranged so as to form one principal opening and two side ones; these wooden posts are tied together by horizontal beams tenoned to the posts, the sides of the entrances being filled in between this framework with panels of wood. Halfway up, above the soffit of the entrance, which is formed of heavy beams, a tiled roof slightly concave projects forward, and exhibits the ends and underside of numbers of rafters supported upon corbelled brackets. Above this roof the upper storey is set a little back and is surrounded by an open balustrade; this upper storey is constructed of wide posts and horizontal beams with wooden filling in, crowned with a cornice of wooden corbels assisting to support the double rafters of the roof. This roof has the heavy appearance, the concave contour, and the semi-gabled form at the ends which is peculiar to all Buddhist temples in the country. After looking at other religious buildings where every part is painted, carved, or gilt, this gateway might be considered somewhat plain, as it has no carving, and is coloured with one uniform dull red colour; but it has more claim to grandeur of proportion and general effect than any other building which I have yet seen in Japan: its great size, good proportion, picturesque roof with ornamental crests, also the numberless corbels, brackets, and rafters, some moulded at the ends so as to suggest the frowning face of a monster; also the deep red colour, bright where the sun strikes it, and subdued in parts by the tree shadows and the sharp deep shadows of its cornices and roofs, all these help to fill the beholder with the liveliest feelings of satisfaction. Passing through this portal we find ourselves in a large open space some 200 feet square, in the centre of which the large temple stood, now burnt to the ground. Across this space, nearly opposite to the great gateway, is a little temple approached by steps leading to a paved ante-court containing a few tombs and an image of Daibutz in bronze. This ante-court is defended towards the entrance by a screen and low gateway. The most note-worthy buildings, however, are on the right hand side of the open space just referred to. These buildings consist of the shrines of the 2nd, 6th, 12th, and 14th Shoguns and those of their wives, with the religious buildings attached. They were originally approached by two other gates, at some distance to the side of the great gateway, which belongs to the large temple now destroyed, but these small gateways are now closed. They are very similar, and it will be sufficient to describe one. The entrance forms the centre of three compartments divided by wooden pillars and connecting beams; the two side compartments form recesses for large wooden figures considerably larger than life, and indicative of exaggerated muscular strength and extreme hideousness. The face of one is painted bright red, and the other a livid green; the posts, wooden panels and gates are carved and coloured in red, black, and gold, with diapers in colour in some parts. The name given to the gate is Nio Mon, Nio being the name of the hideous janitor who is supposed to guard the entrance to Buddhist sanctities, and whose representation is placed in carving on each side of these gateways. Within the Nio Mon an open space or court is passed, containing several rows of stone lamps, being large stone lanterns placed upon circular pillars with heavy bases moulded and carved, in all, about five or six feet high. These were gifts from the smaller Daimios, being offerings to the Shoguns' shrines. Before some shrines there are long avenues of them, increasing in importance as they approach the temple. This court is enclosed by an ornamental screen fence, in which another richly decorated gateway with heavy folding doors leads to another court surrounded on three sides by a wooden screen wall carved and painted and protected by a tiled roof.

Here are situated the large and elegant bronze lamps which were the dedication offerings of the great Daimios, and placed in

* A Paper read at the Royal Institute of British Architects March 4.

the same court to right and left are two structures which are found in some form or other before all Buddhist temples of importance. The first or right-hand building consists of a large battering basement slightly concave and built in this case of stone in large courses, upon which is erected a wooden room of one storey with a large roof, richly carved and coloured roof rafters, brackets, posts, and panels; also an elegant balustrade carried upon projecting corbelled brackets. The ends of the rafters and the corbels of the wooden cornice are carved in the form of dragons and various beasts; and from the corners of the roof little bronze bells and pendant ornaments are suspended by chains. This is called the bell tower, and contains a large bronze bell which was struck formerly in time of war. At the bottom of this battering stone base is one of the few examples of stone carving actually forming part of a building that I have seen, consisting of panels carved with conventional flowers and foliage.

Facing this belfry, upon the opposite side of the court, is a large granite basin, about 3 feet 6 inches by 8 feet, diminishing towards the base, where it is ornamented by means of a trefoil cusp form, cut out of the centre of each side. It has also on one side two exquisitely cast bronze dragons of small size fixed into the stone, and serving as water-spouts. This basin is covered by a highly ornamental shed, consisting of a picturesque tile roof with gilt enrichments, supported upon angle posts sloping inwards towards the top, where they are tied by cross beams supporting brackets and carving just below the eaves. This shed is a beautiful example of Japanese decorative art. The posts are slightly moulded on the edges, and chiselled on the surface in a simple diaper of lines, the whole coloured red. The cross beams which tenon into the posts apparently interpenetrate, their ends reappearing in a moulded form on the other side. They are decorated with a diaper of geometrical design composed of light colours, as are also the groups of brackets above, with the addition of much red and gold. The oversailing rafters of the roof are also richly coloured in a similar way, and shod at the ends with bronze gilt and engraved. The ceiling within is divided by ribs into square panels carved with flowers in relief, and coloured with great delicacy and careful imitation of nature. At the further end of this court, where the largest and most ornate bronze lamps are placed, is a long roofed wooden building upon a stone basement, with a gateway in the centre. This is the entrance of the cloister preceding the Haiden, as the temple we are approaching is called. The long building is quite open on the inside, being a wooden cloister, or gallery, running parallel to the Haiden, from the centre of which another cloister, open on both sides, runs at right angles to the entrance of the Temple. Towards the outside court this cloister presents a range of posts, connected by horizontal beams, filled in with wooden mouldings and carved panels. Above is a wooden cornice, with brackets and projecting roof. The whole being raised above the preceding court presents a stone basement some three feet high, in the centre of which are steps leading to the entrance. The gateway is lower than the roofed cloister, but very imposing. The gate itself is placed between large posts flush with the side walls, but other posts are built out and connected with horizontal beams, so as to form the side of a porch and support the overhanging roof. These sides are filled in some distance from the ground with thick panels of wood carved in the form of a writhing dragon of wonderful execution, cut right through so as to be viewed from either side. The wooden posts or columns of this porch are curved inwards towards the bottom and shod with engraved bronze, placed upon a flat moulded stone base, somewhat similar to that of an Egyptian column. They are reeded, and curve in slightly towards the top, where they are also fitted with an ornamental metal socket. These pillars are connected by horizontal beams, apparently interpenetrating their surface, their moulded ends reappearing. The whole is crowned by the ordinary rich bracketed cornice and forest of rafters, and the ornamental tile roof in this case of double curve.

The gateway and whole range of buildings are beautifully coloured, consisting of bands and small masses of light colour and gilding upon a deep red ground. The posts, beams, and plain woodwork between the panels are red, with gilt bronze shoes, sockets, and belts. A little black is introduced in the form of framework within the main framework of the posts and beams, giving a sort of border to the red panels. In the centre of the spaces thus formed is the raised moulded border, of curvilinear form, containing a panel of carving coloured in whites, light blues, greens, purples, and other cool delicate tints. The beams and brackets of the cornice, and the under sides of the rafters, are decorated in light coloured diapers, not unlike the medieval European diapers found in roofs, ceilings, &c. Gilding is lavishly employed, blended with the colours in the diapers, and ornamenting the edges and mouldings of the beams and panels. On the inside, towards the Temple, the open cloisters are composed of richly carved, coloured, and gilt posts and beams, with cornice and heavy roof. The centre cloister leading up to the steps of the

Haiden increases in height, its roof sloping upwards when the steps are reached until it intersects the principal roof.

The whole interior is low, but this is not always the case in Japanese temples, there being many instances of great interior height, though the entrances are indeed generally low. The floor is the only part which is not ornamented in some way, being covered with the ordinary rush mats; in this case, however, slightly wider than those used in houses. The steps between the rooms are of polished or sometimes of lacquered wood. The entrance is closed with heavy double doors, carved and gilt. The interior walls, where not interrupted by sliding doors and windows at the sides, exhibit the same framework of posts and beams, filled in with panels, and crowned with a cornice supporting the ceiling. The first rows of panels—those next the floor—are filled in with paintings upon a gold ground, representing in some cases large growing flowers and plants, and in other cases hideous imaginary animals. Above these the panels are carved in imitation of flowers and birds, such flowers as the lotus and botan (peony) being great favourites; the whole beautifully coloured. The posts, slightly projecting beyond the panels, support corbels of wooden brackets forming a cornice, with intermediate brackets and paintings between. The framework is coloured red and black, with many metal fittings.

The windows which admit some light within, are small openings of many-curved outline filled in with an open arabesque of wood or metal gilt, placed towards the outside, there being sliding shutters or paper windows on the inside to cover them, if needs be. The ceiling is divided into small squares by ribs, lacquered black, with bronze sockets at the joints: these squares are painted and gilt in representation of dragons. All the painting is done with the most exquisite care and skill. On the outside there are carved panels of birds, plants, and flowers ranged in a line under the coloured bracket, cornice, and rafters. The outside is coloured red, relieved by the gold, bronze, and the light colours of the diapers and carving.

The roof is a fine example of the ordinary temple roof. It is composed of tiles, covered with thin plates of bronze, which have now assumed a dull grey of a slightly greenish tint. The tiles are alternately flat and semicylindrical, and the rolls thus formed along the roof are very effective, added to an ornamental ridge, and richly modelled and gilt terminals. The projecting edges of the tiles at the eaves are gilt, and the cylindrical tiles stamped with the Shogun's crest. The semi-gables which occur at the ends are filled in with carving and pierced wooden pendants, all coloured in red or black, as the parts of the building. This Haiden is said to have been completed as recently as twenty years ago—about ten years before the revolution and the overthrow of feudalism in the country.

In addition to this Haiden, dedicated to the three Shoguns interred in the vicinity, we find, further situated to the right, three small Haidens, scarcely less elaborate dedicated to each Shogun individually, erected at his death, and placed in front of the court preceding his tomb. These three courts behind the smaller Haidens are backed by a high retaining wall, faced with masonry set back, above which are the shrines. They are reached severally by a large flight of stone steps, projecting into the court below. The first reached is the shrine of the 6th Shogun, erected 170 years ago. It is entirely of bronze, and is by far the most handsome of the three. It is some ten feet high, composed of a circular drum with an enriched base upon a stone basement. It is rounded towards the top, and covered with a curved projecting roof formed of bronze, with little chains and bells attached at the corners. Upon the drum is the name of the Shogun sharply cast in the metal, as are also delicate mouldings and foliage, executed with great sharpness.

The whole is enclosed by a low, thick, bronze railing, with little bronze gates diapered on the surface with the favourite key pattern. The tomb is set back; and, in a line with the front of the wall, at the top of the steps, is a little gateway, with roof and double gates, all of bronze. The heavy gates are diapered with very shallow but sharp ornament; and the side wings, or walls, also of bronze, are ornamented with casts of two peacocks in low sharp relief. All the ornament is much more severe, more sparingly used, and the parts much heavier in proportion than the other tombs and their gateways, which are of stone and wood, and of later date.

At Ueno, in the north of the city, there are the Haidens and shrines of the 4th, 5th, 8th, 10th, 11th, and 13th Shoguns, being grouped in threes, having one Haiden to each three, viz., the 8th, 5th, and 13th, and the 4th, 10th, and 11th. The arrangement is exactly similar to that of Shiba, but the stone and bronze lanterns are more numerous; the forms of the roofs, and details of carving, and mode of colouring are rather different. Black is much used in the decoration of these buildings at Ueno. The outer gates are entirely black, with gilt and bronze ornaments, having the peculiarity of a roof covered with small wood shingle instead of tiles. Black is also much used in the decoration of the Haidens, which are otherwise richly coloured, as at Shiba. The shrines of the 4th and 5th Shoguns are bronze, with their railings, gates, and bas reliefs; the bronze has a dull greenish colour approaching to black. Though the arrangements and general mode of construction of these sacred buildings are so similar that to describe each involves much repetition, yet there is such a variety of details—such different treatment in points of decoration, both carving and colouring—that there is in them an endless study for the artist.

The carving is generally cut in camphor wood, and the colour is mixed with a kind of size which seems effectually to resist the action of the weather. The posts, beams and all large surfaces decorated in one colour, are coloured with the medium of lacquer;

which is either left of a dead colour, or is polished to a great degree of brightness. The bronze shoes and other ornaments are deeply engraved and filled in with black in the hollows.

The Japanese sculptors divide carving into three kinds—shallow, deep, and pierced. In the earlier work, such as the bronze tombs and gates of the earlier Shoguns, the relief is very shallow—at the same time very sharp and effective. In the later work, nearly all carving upon the outside—such as in screens, gateways, and cloisters—is pierced in parts, being cut in a thick slab of wood, and can be viewed from either side. A striking thing in sculpture of this kind is the extremely careful imitation of nature, leaves and flowers being carved with a delicacy and truth to nature that is marvellous, and coloured with the same care and beauty. Fruit is gilt, with red dashes of colour showing the ripeness; and the greens in colouring the foliage are varied in their tone. Fore-shortening is frequent and well rendered; and though the Japanese artist does not seem to have understood the principles of perspective, which are often violated when dealing with representations of buildings and rectilinear forms, the perspective of all natural forms is carefully noticed and imitated. In Japanese theatre scenery I have also seen interiors of buildings represented correctly in perspective. The third kind of carving—the deep carving—occurs mostly in the interior of buildings when depth of effect is required, but at the same time no communication with the outer air which would be obtained if pierced carving were used. Beams and posts are often diapered with shallow incised carving, the key pattern being a very favourite one sometimes with the stem and leaves of a plant intertwining. Posts are round, round and reeded, square, or square with the corner slightly rounded or moulded. They are rounded inwards and shod with bronze, both top and bottom, and often a flat bell-shaped capital (similar somewhat to the Egyptian capital called “bell-shaped” by Mr. Ferguson, but flatter still) resting on a stone case of similar form at the bottom. The projections of interpenetrating beams are curled upwards and moulded, or are carved in the form of the fore parts of lions, elephants, or some animal real or imaginary.

In addition to the shrine temples at Ueno there is a temple for public worship, called the temple of Gengen, of considerable size, though far inferior to the large temple burnt down during the revolution. It is approached under a Torii a long paved path, with rude stone lanterns and large trees on either side: this leads to the raised stone platform, or court, which precedes the temple. This is approached by steps and protected by a wooden fence and gateway. This wooden fence is framed with posts and rails, dividing it into three rows of panels horizontally. The centre range is filled in with lattice work of an ornamental character, and the upper and lower ones with carving partly pierced, well coloured, and protected by a little tile roof carried upon a cornice of brackets. The gateway is rather higher than the fence, being covered with an elegant roof of double curve. In this inner court there are elegant bronze lamps; the largest and most ornamental being placed on either side of the steps leading up to the temple floor. The temple is nearly square in form, with a small projection at the back containing a sacred shrine. The whole is carved and coloured both on the interior and the exterior, the constant use of black and red being noticeable, and carving mostly in light colours.

There are a great many Shintoo temples in the country; the principal one at Yedo being the Kudanzaka. The temple grounds are open, and not surrounded by a grove, as are the principal Buddhist temples: they are entered under a structure found before all Shintoo temples, called a Torii. It is composed of two upright posts of great thickness, generally consisting of the whole trunk of a tree rounded, about 15 feet high, and placed 12 feet apart. Across the top of these a wooden lintel is placed, projecting considerably, and curving upwards at the ends; some few feet below this another horizontal piece is tenoned into the uprights, having a little post in its centre helping to support the upper lintel. These Torii were originally of wood, as is the one at Kudanzaka; but when found before Buddhist temples which is not unusual, they are mostly of stone, always showing, however, by their joints and general construction a decidedly wooden origin.

The temple itself is a simple oblong plan, with steps leading up to the entrance, and to an exterior gallery running all round. The roof differs from the roofs of Buddhist temples in being flat and not curved on its sloping surfaces, which are rather steep, and project considerably at the eaves, and in two gable ends. The roof is covered with wood shingle, stained of a dark grey colour. At the gable ends there are cross timbers in the shape of the letter X; straddling the roof also at intervals along the heavy ridge, apparently balanced across it, are curious beams some 6 feet long, tapering towards the ends. The whole appearance is extremely heavy and curious, and the peculiar forms, such as the cross pieces and beams crossing the ridge, seem to indicate its affinity to the original thatched roof. In some parts of the country the Shintoo temples are still covered with thatch. The construction of the walls of the temple is in the main similar to that of the Buddhist temples, but the wood is uncoloured and sparingly decorated with carving. The projecting rafters and ends of beams are generally carved. Colour as an exterior ornamentation is by no means found in all temples, even of Buddhist religion.

There is a temple at Asakusa, in Yedo, which is called Hon-wanji, and which is, I believe, the largest building in the city; but though remarkable for its great size and height, and for the quantity and exquisite workmanship of its carvings, is entirely devoid of colour on the exterior, and the wood has assumed an ashen grey. It is almost square, and is surrounded by a gallery reached by steps, which are roofed over, the posts supporting the roof being shod with bronze, and the beam ends carved into

monsters, lions, or elephants. The gallery floor is supported upon brackets, which spring from the base of the walls of the temple very near to the ground. Numerous beam ends, rafter ends, brackets, and supports are carved into the most delicate representations of flowers, plants, and birds in sharply cut carving. The roof of the temple rises to a great height. The interior is decorated in colour, and, on account of the great span of the roof, there is a peristyle of columns assisting to support it, upon which are groups of corbelled brackets blending with the design of the panelled ceiling. These brackets correspond to similar ones placed round the walls in the cornice over pilasters. The ordinary panels of coloured carving are to be seen below.

Yedo and its immediate neighbourhood contains some twenty-seven temples of importance, besides many other smaller ones as numerous as London parish churches. To describe properly and fully one temple group would require a Paper to itself.

YOKOHAMA MARKET REPORT.

FRIDAY EVENING, MAY 31st, 1878.

IMPORTS:—The week ending 31st May has been unusually quiet. Transactions have been on the smallest possible scale, and afford no indication of the extent of the demand for imported Cottons which is believed to exist in the interior. Yarn is in fairly large stock, but the attempt made by buyers to reduce prices to their own ideas has been met by a firm front on the part of holders, equivalent, in many cases, to an almost total withdrawal of their goods from current offers. The improved political aspect of European Affairs, the home silk news, and the prospect of renewed activity in that important export, tend to give a firm tone to imports, and if holders will continue their present steadiness in refusing to submit to the losing prices of the day, a general advance, and the re-opening of satisfactory business may be looked for shortly.

There is nothing of interest to advise in connection with any particular class of goods.

EXPORTS:—**SILK.** Since the 24th inst., the date of our last report, this market has been as active as could be expected at this season, with such insignificant stocks on show; only about 300 native bales. Prices are pretty well maintained, and holders of what silk there is do not seem at all anxious to sell. The season, in fact, may be considered almost closed.

On the whole, the advices we receive respecting the new crop are favourable, and the export of 1878-79 is expected to reach a large figure.

TEA:—Business in this market still continues brisk, and supplies are pouring in freely, amongst them being some of lower grades than have yet been reported. Some few small lots of Good Common have found purchasers at from \$12 to \$14, but hardly in sufficient bulk to establish a quotation. The leaf character of these parcels is very uneven and ragged, and liquor in cup very inferior.

BLACK:—Further supplies of these have come in; and we can now furnish approximate values, thus:—

Good ordinary, Souchong flavour, ...	\$26 to \$28
Superior to fine, ditto ...	\$29 to \$32
Superior to fine, Pekoe kind ...	\$33 to \$36

We may find reasons to modify these classifications, as fuller supplies come in; but the above, we believe, will be found to describe the grades so far to hand, as accurately as possible in an article of produce of such recent fashion. The character of some parcels is clean and fair in cup, but still they lack the style and pungency of China Red Leafs of the same class. The bulk, too, fails to dissipate the ideas we have stated of their lack of keeping quality. We understand that samples are going forward to both the London and American markets, to be followed by shipments at no distant date; and we hope then to wait on our readers with full reports of their suitability for the home consumer.

EXCHANGE:—Rather more has been done this week in sterling on London at a shade easier rates. Bank paper 6 m/s has been taken to a moderate extent at 3/11½ and 60 days at 3/11½. Credits 4/. On Hongkong and Shanghai a small business is reported at quotations. On New York and San Francisco we hear of no transactions.

We quote:—London Bank, 6 months' sight 3s. 11½d. sight, 3s. 10½d. Credits 6 months' sight 4s. 0d. Documents 6 months' sight 4s. 0½d. Documents continental, 4s. 0½d. Paris Bank, 6 months' sight 4.97½, sight 4.90.—Documents 6 months' sight 5.05. Shanghai Bank Bills, sight 72½. Private, 10 days' sight 73½. Hongkong Bank Bills, sight 4 0/0 disct. Private, 10 days' sight 1½ 0/0 disct. San Francisco Bank sight 95. New York Bank, sight 95. **BULLION.** Gold Yen 391, Kinsatsu 427.

SCHOOL FOR CHILDREN IN SWITZERLAND.

MADAME A. JAQUEMOT (née Dogny) proposes to establish at Geneva, Switzerland, a Boarding School for Girls, and for Boys under 12 years of age; where they will have the advantages of a sound education and sedulous domestic care.

Boys over 12 years of age may be committed to Madame Jaquemot's charge as boarders, and parents can thus secure for them the comforts of a home, with the opportunity of attending one or other of those educational establishments for which Geneva is so justly celebrated.

Parents wishful to place children under her charge at the Pension Dogny, may address their enquiries as to terms &c. to the Editor of the *Japan Times*, who is empowered to furnish them.

REFORM OF THE PRESS LAWS.

THE *Akebono Shimbun* of May 31st. published a draft of the proposed new code of 'regulations for the publication of newspapers,' which is now under consideration in the *Genrō-in*. As this publication could only have been made by consent, the inference is legitimate that the Government wishes to have some expression of public opinion upon the changes it will make in an important section of the law. So far as we know at present, the native press has not responded to the call. We do not think it well to put the code on record ourselves, until it has been finally approved, and is promulgated as an Edict; but as we happen to know that the utterances of the foreign press are studied by the men at the head of affairs in Japan with considerable care, our summarizing the draft and remarking upon its prominent points will not be thought out of place or our criticism deemed unwelcome.

Foreign journalists in Japan, and foreign visitors who, after a few weeks' travel, write upon the country, its people, its politics and its resources, do not, as a rule, gauge fairly or accurately the depths of their own ignorance of the nation; or make sufficient allowance for the difficulties and dangers which surround and harass its rulers. At the same time, we must permit ourselves the remark that the latter have, themselves, not infrequently erred, in making radical changes without giving time or opportunity for sufficient discussion upon them. And we are also of opinion, that the press,—which gives a means of expression for the thoughts of the most intelligent of the people, and might be a very powerful engine for good in influencing the minds of the less intelligent, has been unduly mistrusted and quite insufficiently used. The Government apparently fails to see that the most effective way to meet attacks made upon its policy is by using the same weapons in its own defence: there is assuredly a larger number of people interested in the support of the existing system than in its overthrow, and we have no reason to believe that in their ranks there is a smaller proportion of educated men capable of defending the policy of the Mikado's present advisers than is to be found amongst those who disapprove of and would attack it. It is certain that, by repressing or punishing the expression of adverse opinion, a nation's rulers give to what is imagined a far greater importance than could attach to anything written: whereas one victory, fairly won for them in literary controversy, would give a greater stability to their power than a thousand press prosecutions. And we entirely fail to see in any recent acts of the Government, anything for which they need fear the fullest criticism. We have ourselves subjected each fresh Notification that has been issued of any importance to analysis and remark: we have not always been able to commend, we have frequently had to make suggestions, to point out omissions, sometimes to condemn what have appeared to us to be errors. But we believe that every line of what

has appeared in these columns would have done nothing but good, if the same sentiments had found expression in the native Press. While, had a fuller liberty been permitted to the journals of the capital, had they been permitted to discuss current events as freely as ourselves, can it be doubted that much more good might have been done? The newspapers were permitted to report the minutes of proceedings of the *Kuwan Kuwaigi*, how much more weight would have attached to their deliberations had the debates been reported as well, and how materially might—for instance—the new Provincial Synod Bill have been improved during its course through the house, had its sections been subjected, day by day, as they were brought forward, to the attack and defence of opposition and government journals. Settled and passed, after having passed through the strengthening ordeal of press criticism, it would have gone into operation among constituencies familiar with its provisions, and prepared to assist in carrying them out. And again, if the Finance Minister had invited free expression of opinion upon his Trade Dollar Notification while it was yet in draft, he might have had fresh ideas, fresh arguments presented to him which might have changed his views. The *Chiugai Bukka Shimpō*, in an article which we quote, and reply to, to-day, states, fairly enough, the arguments in favour of the Government's action—so far as it can:—surely no harm could have been done, had such a reply as that of ours appeared originally in the columns of the *Chōya Shimbun*.

It may be—we trust that it is so—that the draft in the *Akebono Shimbun* of the new Press Code is published to elicit criticism, with a view to its amendment before it becomes law. Should this be the intention of the Government, the remarks of the foreign press may have a certain amount of weight, and we accordingly give a short analysis of the proposed bill.

We see no reason to object to the first two clauses, except in one particular. These provide that notice must be given to the *Naimu-shō* (Home Office) of the intention to publish a newspaper, and a license obtained therefrom, and that a money guarantee must be given in the form of a deposit in one of the National Banks. A concession is made, of considerable value, to publications which concern themselves only with literature or science, or which give the Government's Notifications or market quotations, without political comment. (It is not clear whether the discussion of economic and trade questions is permitted in such journals, but it appears probable.) Such have to make no deposit. The promulgation of facts and figures, therefore, and of useful knowledge apart from politics, is rendered as free as possible. Journalists who intend to discuss politics have to make a deposit, varying from one hundred to fifteen hundred *yen*, and the Home Minister is empowered to demand, from time to time, that the deposit originally made shall be increased. To this last clause we must take exception. The most noticeable point in the

code as a whole is that imprisonment for press offences (outside of libel, of course,) is abolished altogether; and we hail this as a great step in advance. But as it is only proper that some check should be imposed, for a time, upon Japanese journalists, fines up to seven hundred *yen*, or periods of suspension up to one hundred days, may be inflicted in lieu of imprisonment; * and, in exaggerated cases—when the Home Minister considers that the peace of the country is actually endangered by its publication, a paper may be altogether suppressed, the whole of its deposit-money confiscated, and the proprietor and editor in fault debarred from the exercise of the profession of journalism for as long as three years. We see no reason to object to this in principle, but the wording of the sub-section, which empowers the Home Minister to order an increase of the amount of deposit is so vague that we cannot understand it. We are told that the amount of security which may be demanded is from one hundred to fifteen hundred *yen*: then, that the Home Minister may order an increase in the security money according to its influence. Now, no paper has any influence at first,—‘influence’ depends entirely on circulation. We cannot therefore imagine that any sum in excess of one hundred *yen* will be demanded of any paper on its first establishment, and it may be intended that the compulsory deposit may be gradually increased, as the journal’s circulation widens, up to fifteen hundred *yen*, at the discretion of the Minister. We are confirmed in this belief by noting that the amount of fine in no case exceeds seven hundred *yen*, except when the journal is absolutely suppressed. But the clause should be more distinctly worded; as it stands, is obscure.

Article III reasserts the obnoxious exclusion of foreigners from the native press. Owners, editors, printers, must all be Japanese, and though ‘contributors’ and ‘correspondents’ are not named in the text, we believe they are meant to be included in the general prohibition. We have recently expressed our opinion that the native Government, by this prohibition, not only debar the people from acquiring much useful information, but deprives itself of valuable and intelligent support. How much more clearly, for instance, could a foreign journalist demonstrate the necessity of imposing these very restrictions than can any Japanese, the press of whose country is not ten years old! An immense inherited wealth of experience, history and argument is at his command, from which a native publicist is debarred. And how much more readily would the people accept such arguments, if put before them in the original, in their own native papers, than merely as translations from a foreign sheet! When we heard that imprisonment for press offences was to be abolished and deposits of caution-money substituted, we were in hopes that this exclusion of foreign pens from Japanese journalism would likewise be removed. Its withdrawal would be the next onward step towards freedom.

Art IV provides that an Editor shall be appointed who will bear the entire responsibility of everything that appears in the paper, and whose name will be printed at the end of each issue. Contributors or correspondents who write on ‘home or foreign affairs, the national finance, the condition of the country, literature, religion and other subjects concerning the rights and liberties of the Government and the people’ must attach their signatures to their work, but are only held responsible after the Editor. But as imprisonment is abolished, and fines will evidently be paid out of the caution money, or other funds of the paper, the operation of this clause will not bear heavily on individuals.

Translations of matter from foreign ‘papers, magazines,

* Under the law of 1875, both imprisonment and fine were the attached penalties to press offences; and occasionally, suspension as well.

or miscellaneous publications’ which infringe these regulations are to be treated as original matter, and their publication punished in the same way. This is perfectly reasonable. Corrections of false reports have to be made as under the old law, but the penalty for infraction of the rule is reduced, and a limit of six months is set for the demand for apology to be made. The very sensible provision is maintained that writers who incite their readers to violations of law are held equally guilty with the actual law-breakers; and we are glad to see a penalty at last put upon the publication of items offending against public morality and decency. Suits in the Courts, *sub judice*, are not to be reported. This seems an inconvenient prohibition; restraint of comment, as with ourselves, should be sufficient, particularly as there are in Japan no juries to be influenced by what they read. No documents relating to foreign countries, nor memorials to the Government, are to be published without permission; and finally, power is reserved to the Home Minister to suppress entirely, or for any period, and to confiscate the whole of the deposit-money, when he considers the continued publication of any journal likely to endanger the peace of the country. In this latter case only does any punishment fall on the person; and this only the light one of being prohibited from exercising the profession of journalism for periods of from one to three years. To subjects of constitutional, representative governments, this power, vested in the hands of a single individual, would seem tyrannous and unbearable; but so long as the government of Japan remains what it is, a despotism, this arbitrary power must necessarily be exercised by its members. And until, we take leave to say, the people and the press,—at present their only representative,—show themselves fitted for better things, it is well that this strong check should be retained. It is well for Japan that—as we said last week—her despotic government is administered by men who are enthusiasts for constitutionalism; the powers created by this law appear to us to be in safe hands, and are not likely to be misused.

On the whole, the Government and people of Japan are to be congratulated on a decided amelioration of the Press Laws; and, with the exception of the continued exclusion of foreign writers, who could both raise the tone of the native press, and help the Government in educating the people, there seems little room for further amendment for some years to come. In our opinion the native press has now as much freedom as is good for it at present; and, as we have had occasion to notice, Government has exercised, during the past six months, a very wise leniency towards it. The forthcoming modifications of the law indicate still further its wish to conciliate native journalists, and it remains for these now, by refraining from abusing their new privileges, to show themselves worthy to have granted to them still greater concessions.

COMMERCIAL EDUCATION.

A WRITER in the *Chiugai Bukka Shimpō*, the leading commercial journal of the capital, laments the want of schools where a practical mercantile education can be given to boys and young men destined for mercantile life. He appears to think that some compilation of rules for commercial education can be drawn up, which would be easily intelligible and which would answer the purpose which he seeks. It must certainly appear strange to many a Japanese mind that, among all the highly paid foreign professors whose services are retained by the Government, to teach various branches of education in the boasted western fashion, not one can be found to give really useful and practical instruction in every-day common-place business. But this writer very naïvely tells us how his

countrymen, having discarded a most excellent system—indeed the only practical system—of commercial education, by means of apprenticeship, now appear to want a 'royal road' to the acquirement of this branch of knowledge. We must tell him that there is none, either for Japanese or for students of any other nationality.

There exist in Europe and in America what are called 'commercial academies'—and in some places, where education is treated as a science and made the speciality of the town—as, for instance, in Geneva,—a pupil may go through one or other of various alternative courses, according to the career for which he is destined. And of these courses, one is always devoted to the teaching of such branches of study as are likely to be found useful in commercial life. Great attention is paid to hand-writing; to the study of English, as the mercantile language of the world; other modern languages are cultivated to some extent; book-keeping is taught, after a fashion,—that is, its leading principles are explained; the study of arithmetic, as applied to commerce, and particularly of mental arithmetic, occupies much of the pupils' time, and, in the higher classes, the broad outlines of Plutonomy, and a smattering of mercantile law,—both of which subjects had better be left to be taken up in later life—are offered to the student. Such a school might easily be established in Japan, or such a 'course' grafted on to the existing university system. But the result would be precisely the same as among western nations. The pupils would come out of such a school, and would enter merchants' office, only to find that they had learnt nothing of any practical value to them, unless they happened, which is very unusual in early life, to have acquired a rapid, yet clear and firm style of penmanship. Every branch of trade has its special knowledge, which is, in it, the only valuable knowledge;—each merchant has his own method of book-keeping, to suit the requirements of his business;—interest and exchange tables, and 'ready reckoners,' which can be used mechanically, supersede mental arithmetic, which gives its results with less rapidity than tables, and with dubious accuracy: commercial English, French, German and Spanish are all found to be widely different from the languages of the schools, and to consist of a sort of 'slang' with a most limited vocabulary; and—in fine—the best pupil of a 'commercial academy' is mortified and disappointed, on taking possession of his stool in a counting-house; to find himself practically useless, and decidedly of less value to his employers than an office-boy or a copying clerk, on whose education no money has been spent, but who has over him the advantage of a year or two's practical experience in the details of the office work.

In truth, a mercantile education cannot be gained in any other school but a shop or a warehouse; and the best advice we can give in reply to the appeal made to us is:—revive and extend the system of apprenticeship. As lightly sketched by the writer in the *Chiugai Bukka Shimpô*, and as remembered by the older men amongst us, when recalling the state of society at home thirty or forty years ago, this apprenticeship system was always a practical, and generally a pleasant method of learning a business. It certainly turned out more competent and thorough tradesmen and merchants, and more worthy citizens, than can be produced, either in Japan or elsewhere, under the new plan, which is very much the same in other countries as our Japanese friend describes to be now pursued here—of grown men going into business without passing through the necessary stage of pupillage. In our fathers' time, a child of twelve or thirteen, received into the family of a tradesman or merchant, and treated as son and servant at once, acquired rapidly what was of far more use to him than anything he could learn at a commercial academy,—habits of obedience, docility, promptitude, regularity of conduct, and order; he did not learn

the special business to which he was apprenticed,—he rather absorbed a knowledge of it insensibly and unconsciously; as a general rule, he had sufficient time at his disposal to enable him to acquire general knowledge,—to learn, perhaps, another language or two than his own; and it was certainly the rule, with very few exceptions, that he was encouraged and incited to self-improvement by both precept and example. From all we can learn of the Japanese inner life, much the same system appears, till lately, to have been practised here; all must have noticed the active, smart, well-bred youngsters who used to do so much of the work of serving customers in any respectable shop in Tôkiô or Osaka, evidently apprentices, and apparently well treated and happy; we learn with regret from the article we quote to-day, that this apprenticeship system is being abandoned, and that the bond which now unites master and shop-boy is merely the loose one of a money payment. As the Japanese writer says, this system is quite destructive of the hope of bringing up a new generation of worthy tradesmen: where the master's and servant's duties are limited to simple payment of money for simple service rendered, the tie is far looser than the old one, which bound the apprentice to the master by feelings of veneration and regard, and was strengthened by the semi-paternal authority exercised by the master over boys in whom he felt somewhat of a father's pride and interest.

From what our writer tells us, it would appear that one of the reasons that apprenticeship is falling into disuse is that a large number of *shizoku*, whose occupation is gone, and who find themselves cast on the world with but scant capital to represent their commuted pensions, are wishful to enter into trade, but are naturally averse to go through a drudgery of seven years' apprenticeship under masters belonging to a class which they despise, while they are compelled to enter it to gain a livelihood. It is natural enough that men so circumstanced should seek to get the knowledge they want from books: unhappily for them, it cannot be so procured. Their case is a hard one, and deserves far more sympathy than it usually receives. We have always been of opinion that this government was in error in creating its new army of *heimin*, instead of trusting the protection of the country to the *shizoku* class. We are fully aware of all the objections to the latter plan, and appreciate the motives which impelled the government into the course they chose; but the evils they dreaded are hardly worse than those of rebellion and discontent they have had to face, and have still by no means vanquished. They have drafted from the fields an army of peasants, the want of whose labour is severely felt, and they have upon their hands, that most dangerous of all classes, a suddenly disbanded impoverished, and discontented soldiery. What can these men do? They 'cannot dig, to beg they are ashamed': how to provide them with occupation and means of livelihood is the most difficult problem of all those which the rulers of this country have to solve. Both they and the unfortunate *shizoku* have the fullest sympathy of all friends of Japan; for until some satisfactory solution is arrived at, of the difficulty which oppresses both, there can be neither peace nor progress for the country, nor can there be content for the people. We cannot hope that the solution will be found in the *shizoku* being absorbed into the trading classes: but there are some trades, of course, for which a few of them are fitted. These they can enter; but their mysteries are not to be learnt from books, and nothing but apprenticeship, or some cognate form of servitude, will give them the special knowledge they require.

THE NEW CURRENCY.

WE HAVE now before us, in an article we quote to-day from the Japanese Press, what we have reason to know is a semi-official defence of the Government's

action with regard to the Trade Dollar of 420 grains, and an indication of the policy it contemplates pursuing in the future. We are not among those who seek for opportunities of decrying everything done by this Government, and we are always ready to give it credit of earnestness and zeal for the country's good. Unfortunately 'zeal,' more often than not, 'outruns discretion,' and the Government's action respecting its Mint has, throughout, appeared to us one of the many examples of zeal winning a race where the prize is loss. But however we may regret this, we cannot feel surprise. Nothing could be more natural, for instance, than that the Finance Minister and his colleagues in the Government should wish to disperse, as soon as possible, with the expensive foreign staff at first engaged for their Mint, and to run the machine themselves: their workmen had been proved sufficiently competent to turn out machinery—even the most delicate weighing machines—and their die-sinking and all other work left nothing to be desired. It should not be matter for surprise that they should fail to see that the intangible matter of their Mint's credit would be affected by the dismissal of the Foreign Director—nor can we wonder, now, that—after giving the proofs of the skill and trustworthiness of their present staff, afforded by repeated foreign testimonials of assay—they should resent the disinclination still shown by the China merchants to accept their coin without a foreign guarantee. Again, when some of their best men were commissioned to seek information in America and Europe on currency questions; what more natural than that they should return with erroneous views? The only 'popular' and intelligible definition of metaphysics that we have ever been able to obtain is, that it is 'a science which teaches one man to explain to another what he does not understand himself'; and when we consider how forcibly currency questions are affected by surrounding local circumstances and local interests, it is not to be wondered at that the Japanese seekers after economic truth should have returned without finding it. Utterly confused by the 'multitude of counsellors' from whom they extracted only opposing *dicta* of wisdom, which neutralized and contradicted each other, it is perfectly natural that they should have been reduced to give the preference in their decision to the numerical preponderance of the various opinions which they had collected,—which was in favour of gold. Their fault was—of course—in seeking for information abroad at all. They had here, in the then Manager of the Oriental Bank, Mr. John Robertson, a thoroughly capable, honest, and reliable financial Mentor. His long experience of the country had made him a far more efficient adviser for the Japanese, than any man, however eminent, in the worlds of theoretic or practical finance outside of Japan: and his honesty and friendly feeling had been fully proved in 1869, when he separated himself from the foreign mercantile community here on the '*nibu* question'—defied the Chamber of Commerce,—secured the powerful aid of the British Minister, and saved the country the expenditure of some millions of hard silver *bus*. His advice to them, on the establishment of the Mint, was to coin a silver dollar, equivalent in weight and fineness to the Mexican;—and he worked loyally for them in China and elsewhere, to assist in the establishment of their coin, to make it an acceptable legal tender throughout this part of the East. There is no reason to doubt that success would have very speedily rewarded perseverance in the path he had marked out; and it is most regrettable that the Government should have sought advice farther afield. But we have little reason to quarrel with the advisers they found, except in the case of certain American financial authorities, who advised them with the interest of America in view, which, on this question, is diametrically opposed to the interest of Japan. To the questions

they put, abstractedly, they got the answer in the abstract—on which all financiers agree—that of the two metallic *media* of exchange, gold is preferable. No regard was had, by either questioners or respondents, to the modifying, surrounding circumstances of Japan, China, and Oriental racial prejudice. The failure of our own attempt to force a gold currency on India was entirely overlooked, though, in all conscience, obvious enough. Therefore—the balance of American and European opinion being—as our friend of the *Tôkiô Economist* tells us, in favour of gold—that metal was made the standard here.

The record of the Japanese gold currency, from the coinage of the first gold piece to that of the last, has been one uninterrupted story of disaster and loss. If the Government could have made their gold the only standard, they might have succeeded in establishing it, and in affording what England would have greeted as a most useful example to her Indian subjects. But the Mexican dollar, the treaty standard coin, occupied the vantage ground of custom and prejudice, and the gold *yen* never had a chance. Now, establishing a third legal tender, the 420 grain Trade Dollar, the Government virtually tells us, through the *Chiugai Bukka Shimpô*, that it intends ceasing to coin gold. This is well, but two standards will still remain, and the government is no nearer than before to its object—the substitution of Japanese for Mexican coin as a medium of exchange in this part of the world.

But that we should have such a manifesto as that which we are reviewing is a great advantage; for now—for the first time—we have before us a distinct statement of argument and assumed fact, and have no longer to beat the air in fighting against rumour and supposition. The position taken up by the Government is this. The U. S. Trade dollar is not favourably received in China and adjacent countries; a sufficiency of Mexican dollars for the wants of the trade is not always easily attainable, by reason of the distance from China of the source of supply; and the British Government is averse to re-establishing a Mint in Hongkong, to coin a British Dollar. In addition to these circumstances, the Government believes that some foreign Bankers and merchants are 'working indirectly to get the Japanese Trade Dollar' established. Therefore, with these advantages in its favour, 'it may be expected' they say, 'that it will overcome all others and become the only current coin in all Oriental countries.'

Here we have a grain of truth in a large measure of mistakes. The American Trade Dollar cannot gain a footing in China, for just the same reason—a reason which the Japanese financial mind is as yet, apparently, unable to grasp—that the Japanese trade dollar will fail:—that it is a better coin than the Mexican. That the supply of Mexican dollars is unequal to the demand is of course a fallacy—pure and simple—probably the offspring of the sudden rise in exchange, two years ago, when the market was for six weeks bare of coin to meet a very sudden rush of the buyers of silk. That the British Government has declined to coin a British Dollar for use in China at the Royal Mint in London is true; but if the Japan Mint will not turn out the coin required, Hongkong itself, or Birmingham, or some other centre of capital and enterprise will. The establishment is now suggested of a Mint at Saigon. And finally, that foreigners are anxious, or trying, to establish the Japanese Trade Dollar in the China trade is again a mistake. The Dollar which Mr. Robertson would have established was the silver *yen*, identical with the Mexican dollar in everything but design, in which it was superior. This is the coin required in the trade now, the coin which foreigners will assist in establishing; and until the Japanese Government is convinced of this, and allows the Osaka Mint to produce such a coin, it must not hope that Japan will take the place of Mexico.

It is not necessary for us, we fear, to discuss the question raised in the last paragraph of the article under review: how the new Trade Dollar is to push the Mexican out of circulation here. Its excess in weight, of course, would prevent this in Japan as in China—but we see no present likelihood of dollars being coined at all, to any great extent. We cannot congratulate the Government on the success of the Internal Loan and, to all appearance, the metallic reserves are exhausted. It is fortunate for the Government that its paper is taken with such confidence by the people, and so long as the harvests continue to be up to average, we see no reason to fear difficulty in paying the interest on foreign debt. The excess of imports over exports is a satisfactory proof that the country makes an enormous profit on the latter, and so long as a piece of paper will buy as much food as the piece of silver or gold it stands for, no other medium of exchange is wanted for internal trade. And for the foreign trade, the Mexican dollars now in circulation appear to suffice. We should prefer a more stable coin, of course, and suffer from its absence;—but the 'shroffage' falls mainly on the Japanese, and makes our own Chinese labour very cheap to us. We can get on with it, failing a better. But if the Japanese want to get rid of the Mexican incubus, and to compete successfully in China for Mexico's profits in the coin business, they must abandon the idea of coining a 420 grain Dollar and substitute for it, in Notifications 12 and 13, the 'silver yen.' And the sooner this is done, the better for all concerned.

WE have to put on record the following Notification respecting the new Forestry Laws supplementary to that numbered 4a and published on the 14th March. The new clauses appear to be necessary and quite unobjectionable, as without them, a door was clearly left open to fraud.

NOTIFICATION BY THE NAIMUSHO,
(HOME OFFICE.)

No. 14a. 3rd day, 6th month, 11th year of
Meiji (3rd June 1878.)

"It is hereby notified that all who apply to the Government in accordance with Notification No. 4a. of the 3rd month of this year, publishing the 'Regulations relating to Tithed Plantations of Woods,' must observe the following additional clauses, and not violate them.

(Signed) ITO HIROBUMI,
(Minister for Home Affairs.)

1.—"Those persons who, having obtained permission to lease Government lands on accordance with the 'Regulations &c.' secretly lend the same to other parties, pledge, or mortgage the lands without complying with the forms prescribed in Clause X. of the Regulations * :—

2.—"All persons who do not commence planting after one entire year has elapsed since they got their leases (except where, as provided for in the Regulations permission to plant a very large tract is given, and three years allowed for the work):—

3.—"All persons who shall, even within the limit of a year, employ the ground for other purposes than that for which it was granted, viz. tree-planting:—

4.—"All persons who, though their intentions may be evident, having leased one piece of ground (A) sow seed in other ground (B) with the purpose of transplanting into A the saplings; and fail so do so within three entire years after the date of their leases:—

5.—"All such persons, who act in violation of the Regulations in the manner above set forth, will at once be deprived of their land and anything attached thereto, and will be required to pay a sum of money equivalent to the amount of ground rent during the period of their occu-

* Clause X. of the Regulations provides that in such cases the holder is to apply for permission to the local Government office, giving full particulars in each case; and the name of the transferee or mortgagee is to be then endorsed on the lease.

pancy, from the date of their lease being granted to that of their deprivation thereof. And all persons who may borrow or receive in pawn or pledge, as forbidden in Clause 1 of these additional regulations, will be for ever after incapacitated from holding Government lands on lease under these Regulations.

EDITORIAL NOTES.

THE summer is rapidly approaching, and, with the mournful experience of last year fresh as it should be in our recollection, we ought early to bestir ourselves to prevent the appearance amongst us of epidemic disease, which is a much better plan than making only provision for its cure. We very strongly recommend all householders to read carefully a letter of Mr. Brunton's which was addressed to this newspaper in 1869 and which appears to us to require reproduction now. We therefore reprint it in another page of this number. Many residents, with the laudable idea of keeping their compounds clean, are—we regret to hear, running subsidiary pipes into the street drains, without making any provision of the necessary volume of water to carry off solid offensive matter. It cannot be too strongly impressed upon our fellow-townsmen that this is very dangerous and harmful, and likely to produce exactly the evils they mean to obviate. The system of pipes laid down by Mr. Brunton was for 'storm drains' and they are intended to carry off, of themselves, surface water only. Provision was made, of which householders could avail themselves, to relieve their compounds of house-sewage, but only on the condition of their arranging for a sufficient supply of water, to be discharged at the same time as the solid matter, to keep this in suspension. Any householder who has connected his kitchen and other out-houses with the 'storm-drains' without making this necessary provision for flushing, has therefore done that which, sooner or later, will end in choking the drain, thereby creating a source of poisonous gases, and a poisonous drainage into his own or his neighbours' wells. The first thing to which a Sanitary Committee should direct its attention here is this matter. Mr. Brunton's drains have been laid down now over eight years: they have never received any repair and we know that some of them are already choked: he wrote in his letter in 1869 most truly "In Yokohama the materials for the production of disease may be said to be perfect, and under the circumstances it is astonishing it has escaped so well." We saw last year that we can no longer depend on escaping scot-free,—and though we are very far from being alarmists, and if cholera were actually amongst us, should refrain as far as possible from writing on the subject;—now, while we are yet free from disease, and have time granted to us to take precautions against an outbreak, we cannot too strongly urge the adoption of the necessary measures. And amongst the most necessary, are those pointed out in the letter which we reprint, to prevent the choking of the street drains.

We regret to note, by the way, that—though months have elapsed since the site for the Hospital for Infectious Diseases was reported to have been selected: nothing has been done towards building it.

WE do not hear, since the promulgation of the new Forestry laws, of any waste lands having been taken up by the people for the purpose of re-planting with wood. Nor do we see on the part of the Government, any efforts being made in this direction; though it is believed that a portion of the new Internal Loan is to be devoted to this purpose. While, on the other hand, accounts continue to reach us of clearances of forest land still going on in Hokkaido. It might have been thought that the very strong evidence of the folly of disafforestation and of its most disastrous ultimate consequence—nothing less than the actual depopulation of the country—which are now being exhibited in the neighbouring empire of China, would have had the effect of rousing this Government to take immediate remedial measures; or at all events, to issue stringent orders to check the growth of the malady—to stop all wood-cutting except under proper, skilled direction. Apparently this has not been the case. The people here feel no very perceptible ill effects from the denudation of the hills, or are unable to trace occasional inundation, or

gradual dessication, to this as a source of the evil, while they think—perhaps—that the condition of their country is so far different to that which they hear of as the state of China, that it is impossible for them ever to be reduced to the same distress.

Another country, however, respecting which the Japanese by no means lack information, is now affording her an example of the consequences of disafforestation at an earlier stage of the process of decay. The destruction of the woods, and neglect to replant them, has done vast injury to the once rich corn-lands of Russia, which stretch for so many miles on either side of the great river Volga: so much so that now the Russian government is forced to give its most serious attention to the matter. A series of successive short crops on the wide straths of land around Samara and in other districts demonstrate the existence of a growing evil, and call for immediate cure. The people have become so impoverished, as to have required to be supported, during the past winter, mainly by Government. Their distress and privations have been excessive, and the evil is distinctly traceable to the destruction of the woods which protected the head waters of the Volga and its tributary streams. This, the great riverine artery of the Russian empire, has become variable in its character. The level of its wide waters, during the summer and autumnal months, sinks so far below that of former years, as seriously to interfere with navigation; while, during the rainy season, it rises so rapidly as to do damage by flood. To restore it to its proper condition, and to regulate its affluents and influents, to strengthen its banks by planting, and to protect its sources by reclothing the hills with wood, will require expenditure which at present Russia can ill afford; but which must be made soon, lest worse troubles eventuate. Already climatic change has been induced by the reckless clearances of the woods, and not only have the corn crops been diminished in quantity, but the character of the grain has been injured; so that, in England, Russian wheat is now complained of, on account of the lightness and inferiority of most samples. Of course the drain on her labour and treasure set up by a long and costly war adds to the difficulty of doing the indicated work; but if parts of Russia are not to become like those provinces of China the depopulation which we are now watching, the work must be done and the mischief repaired without delay. Parts of Japan are in an earlier stage, but only in an earlier stage, of deterioration; the process of decay has commenced and '*vires acquirit eundo*;' the rulers of the country should be warned by others' misfortunes and take, in time, the necessary steps to protect the people against the scarcity which will culminate in famine and death.

A NUMBER of arrests have been made of men cognizant of, or accessory to, the murder of the late Home Minister. The native papers tell us of two persons having been arrested in Kochi *ken*, three in Kumamoto, three in Yamaguchi, one in Hiroshima, and seven in Hiogo *kens*. These appear to be distinct from the arrests we mentioned last week as having been made in Ishikawa *ken*, whence came five of the assassins, and would seem to indicate the existence of a secret society. It behoves the surviving Ministers to take due care of themselves, and we earnestly hope that the precautions which have been initiated, in the shape of guards and patrols, will not soon be relaxed.

THE *Nichi Nichi Shimbun* (semi-official journal) tells us that H. E. Mori, who has just returned from Peking, will be appointed Vice-Minister for Foreign Affairs, and that H. E. Tanaka, now Vice-Minister for Education, will proceed to take Mori's place as Ambassador to China. Also that the Mikado, before starting on his Northern progress, will visit Kanagawa and Shizuoka *kens*. This will give foreign visitors an opportunity of seeing his Imperial Majesty.

H. E. Sano Tsunetami is to be the Minister to Italy, says the *Uochi Shimbun*; but we note that our contemporary the *Gazette* gives this appointment to Yamawo Yozo, at present Vice-Minister of Public Works.

The Bill lately passed by the *Chihokwan Kuwaigi*, providing for the establishment of Provincial Synods, which we commented on at length in our last issue, has now we hear passed the Genrō-in, and an Edict embodying it will be published in a few days. We publish to-day some sup-

plementary clauses to the new Forestry laws promulgated last March.

THOSE of our readers who are concerned in the Tea trade will read with much interest the remarks on the new season's crop, and on the Yokohama Tea trade generally, which are embodied in an article which we translate from the *Chingai Bulka Shimpō*, and print in another column. Very important is the writer's admission of the deterioration in the quality of the new teas and his argument accounting for this appears sensible and correct. We may strengthen his appeal to his countrymen to improve the quality by more careful picking and preparation by putting into his hands a very important argument which he has omitted to use. Japan uncoloured teas are by no means the only teas of the class which America receives, to say nothing of the widely different Indian and Chinese Black teas: whereas Japan has no other markets open to her than those of the United States. In such a state of things as this, it is clear that the buyer has all the advantage on his side. And, pushing further his argument of the reaction, back and forward, of low price on low quality, and low quality on low price; precisely the same damaging process goes on with respect to demand and supply. The Japanese offers his American Customer a worse and worse sample of tea, in exchange for a lower and lower price, but meanwhile, the customer looks out for an article from elsewhere which suits him better, and consequently—as the quality falls, so falls also the demand. As we showed lately, Japan teas have now a most formidable rival in the American markets in Formosa Oolongs; and if the quality of Japan tea is allowed to go on sinking, it will, ere long, be pushed out of the market altogether. If what this Japanese writer tells us is true—viz: that labour is so scarce and dear in the country, (and we believe him to be quite right) it is clear that the only plan to adopt is to grow less tea. Then, increased care in picking and preparation will soon bring up the price again, and the reduced export—of finer quality—will stimulate demand.

His remarks on Black Tea are not of much value. We have reason to know that he is correct enough in his quotation of London valuations: those put on the small samples sent hitherto have ranged from 1s. 2d. to 1s. 5d. and 1s. 6d.; but are natives willing to sell at prices here that will leave the shipper a margin on these figures, after packing, leading, loss of weight and other charges are taken into account? Assuredly his market quotations here of \$37 and \$38 to \$50 per picul leave no such margin. He must not deceive himself with respect to these prices, which are only given for small fancy packages. And we most earnestly trust that the teamen are not going to be led into the terrible disaster of shipping largely to London on their own account, before the market has been tried by means of small trial shipments. Foreign shippers are not likely to set them the example.

WE have been exceedingly surprised that none of our daily contemporaries have reproduced Lord Salisbury's Despatch on the Eastern Question and Prince Gortschakoff's reply; and we therefore place these most interesting State papers before our readers. They have all the more interest now that we know that the Congress is actually going to meet; because we may be certain that the basis of negotiations at that assembly is formulated in the British state-paper. On no other terms than the temporary abrogation of the Treaty of San Stefano, and its full discussion by all the Powers interested, would England have gone into Congress at all; and that Lord Beaconsfield should have succeeded to gaining such a point is a splendid diplomatic triumph.

THE TREATY AND THE CONGRESS.

(From 'The Times' of April 2.)

THE following circular despatch, addressed by the Marquis of Salisbury to Her Majesty's Embassies, was issued from the Foreign Office yesterday:—

"Foreign Office, April 1, 1878.

"My Lord (Sir),—I have received the Queen's commands to request your Excellency to explain to the Government to which you are accredited the course which Her Majesty's Government have thought it their duty to pursue

in reference to the Preliminaries of Peace concluded between the Ottoman and Russian Governments, and to the European Congress which it has been proposed to hold for the examination of that treaty.

"On the 14th of January, in view of the reports which had reached Her Majesty's Government as to the negotiations for peace which were about to be opened between the Russian Government and the Porte, and in order to avoid any possible misconception, Her Majesty's Government instructed Lord A. Loftus to state to Prince Gortchakoff that, in the opinion of Her Majesty's Government, any treaty concluded between the Government of Russia and the Porte affecting the Treaties of 1856 and 1871 must be an European treaty, and would not be valid without the assent of the Powers who were parties to those treaties.

"On the 25th of January the Russian Government replied by the assurance that they did not intend to settle by themselves ('isolément') European questions having reference to the peace which is to be made ('se rattachant à la paix').

"Her Majesty's Government, having learnt that the bases of peace had been arranged between the Turkish and Russia delegates at Kezanlik, instructed Lord A. Loftus, on the 29th of January, to state to the Russian Government that Her Majesty's Government, while recognizing any arrangements made by the Russia and Turkish delegates at Kezanlik for the conclusion of an armistice and for the settlement of bases of peace as binding between the two belligerents, declared that in so far as these arrangements were calculated to modify European Treaties and to affect general and British interests, Her Majesty's Government were unable to recognize in them any validity unless they were made the subject of a formal agreement among the parties to the Treaty of Paris.

"On the 30th of January Lord A. Loftus communicated this declaration to Prince Gortchakoff, and his Highness replied that to effect an armistice certain bases of peace were necessary, but they were only to be considered as preliminaries and not definitive as regarded Europe; and stated categorically that questions bearing on European interests would be concerted with European Powers, and that he had given Her Majesty's Government clear and positive assurances to this effect.

"On the 4th of February the Austrian Ambassador communicated a telegram inviting Her Majesty's Government to a Conference at Vienna, and Her Majesty's Government at once accepted the proposal.

"On the 5th of February his Excellency addressed a formal invitation to Lord Derby, stating that:—

"L'Autriche-Hongrie, en sa qualité de puissance signataire des actes internationaux qui ont eu pour objet de régler le système politique en Orient, a toujours réservé, en présence de la guerre actuelle, sa part d'influence sur le règlement définitif des conditions de la paix future.

"Le Gouvernement Impérial de la Russie, auquel nous avons fait part de ce point de vue, l'a pleinement apprécié.

"Aujourd'hui que des Préliminaires de Paix viennent d'être signés entre la Russie et la Turquie le moment nous semble venu d'établir l'accord de l'Europe sur les modifications qu'il deviendrait nécessaire d'apporter aux traités susmentionnés.

"Le mode le plus apte à amener cette entente nous paraît être la réunion d'une Conférence des Puissances Signataires du Traité de Paris de 1856 et du Protocole de Londres de 1871."

"On the 9th inst. the Austrian Government proposed that instead of the Conference at Baden-Baden, as previously contemplated, a Congress should be assembled at Berlin. Her Majesty's Government replied that they had no objection to this change, but that they considered that it would be desirable to have it understood in the first place that all questions dealt with in the Treaty of Peace between Russia and Turkey should be considered as subject to be discussed in the Congress, and that no alteration in the condition of things previously established by treaty should be acknowledged as valid until it has received the assent of the Powers."

"On the 12th of March Count Beust was told that Her Majesty's Government must be perfectly clear on the points mentioned in the letter to him of the 9th inst. before they could definitively agree to go into Congress.

"On the 13th Her Majesty's Government explained further the first condition.

"That they must distinctly understand before they can enter into Congress that every article in the treaty between Russia and Turkey will be placed before the Congress, not necessarily for acceptance, but in order that it may be considered what articles require acceptance or concurrence by the several Powers, and what do not."

"On the 14th the Russian Ambassador communicated the following telegram from Prince Gortchakoff:—

"Toutes les Grandes Puissances savent déjà que le texte complet du Traité Préliminaire de Paix avec la Porte leur sera communiqué dès que les ratifications auront été échangées, ce que ne saurait tarder. Il sera simultanément publié ici. Nous n'avons rien à cacher."

"On the 17th, Lord A. Loftus reported that he had received the following Memorandum from Prince Gortchakoff:—

"In reply to a communication made by Lord A. Loftus of the despatch by which Lord Derby has replied to the proposal of Count Beust relating to the meeting of the Congress at Berlin, I have the honour to repeat the assurance which Count Schouvaloff has been already charged to give to Her Majesty's Government—viz., that the Preliminary Treaty of Peace concluded between Russia and Turkey shall be textually communicated to the Great Powers before the meeting of the Congress, and that in the Congress itself each Power will have the full liberty of its appreciations and of its actions."

"In a despatch received on the 18th Lord A. Loftus stated that Prince Gortchakoff had said to him that of course he could not impose silence on any member of the Congress, but he could only accept a discussion on those portions of the treaty which affected European interests.

"Lord Derby having asked Count Schouvaloff for a reply from Prince Gortchakoff, his Excellency informed him on the 19th that he was 'charged to represent to Her Majesty's Government that the Treaty of Peace concluded between Russia and Turkey, the only one which existed, for there was no secret engagement, would be communicated to the Government of the Queen in its entirety, and long before ('bien avant') the assembling of the Congress. The Government of the Queen, in like manner as the other Great Powers, reserved to themselves at the Congress their full liberty of appreciation and action. This same liberty, which she did not dispute to others, Russia claimed for herself. Now, it would be to restrict her, if, alone among all the Powers, Russia contracted a preliminary engagement."

"On the 21st Lord Derby replied that Her Majesty's Government could not recede from the position already clearly defined by them; that they must distinctly understand, before they could enter into Congress, that every article in the treaty between Russia and Turkey would be placed before the Congress, not necessarily for acceptance, but in order that it might be considered what articles required acceptance or concurrence by the other Powers and what did not.

Her Majesty's Government were unable to accept the view now put forward by Prince Gortchakoff that the freedom of opinion and action in Congress of Russia, more than of any other Power, would be restricted by this preliminary understanding.

"Her Majesty's Government therefore desired to ask whether the Government of Russia were willing that the communication of the treaty *en entier* to the various Powers should be treated as a placing of the treaty before the Congress, in order that the whole treaty, in its relation to existing treaties, might be examined and considered by the Congress.

"On the 26th Count Schouvaloff wrote to Lord Derby that the Imperial Cabinet deemed it its duty to adhere to the declaration which he was ordered to make to the Government of the Queen, and which was stated in the letter which he had the honour to address to him dated the 19th of March.

"As different interpretations had been given to the 'liberty of appreciation and action' which Russia thought it right to reserve to herself at the Congress, the Imperial Cabinet defined the meaning of the term in the following manner:—

"It leaves to the other Powers the liberty of raising such questions at the Congress as they might think it fit to discuss, and reserves to itself the liberty of accepting or not accepting the discussion of these questions."

"Her Majesty's Government deeply regret the decision which the Russian Government have thus announced.

"How far the stipulations of the Treaty of San Stefano would commend themselves as expedient to the judgment of the European Powers it is not at present possible to decide. But even if a considerable portion of them were such as were likely to be approved, the reservation of a right, at discretion, to refuse to accept a discussion of them in a Congress of the Powers would not on that account be the less open to the most serious objection. An inspection of the treaty will sufficiently show that Her Majesty's Government could not, in a European Congress, accept any partial or fragmentary examination of its provisions. Every material stipulation which it contains involves a departure from the Treaty of 1856.

"By the declaration annexed to the first Protocol of the Conference held in London in 1871, the Plenipotentiaries of the Great Powers, including Russia, recognized 'that it is an essential principle of the law of nations that no Power can liberate itself from the engagements of a treaty, nor modify the stipulations thereof, unless with the consent of the Contracting Powers by means of an amicable arrangement.'

"It is impossible for Her Majesty's Government, without violating the spirit of this Declaration, to acquiesce in the withdrawal from the cognizance of the Powers of articles in the new treaty which are modifications of existing treaty engagements, and inconsistent with them.

"The general nature of the treaty and the combined effect of its several stipulations upon the interests of the Signatory Powers furnish another and a conclusive reason against the separate discussion of any one portion of those stipulations apart from the rest.

"The most important consequences to which the treaty practically leads are those which result from its action, as a whole, upon the nations of South-Eastern Europe. By the articles erecting the new Bulgaria, a strong Slav State will be created under the auspices and control of Russia possessing important harbours upon the shores of the Black Sea and the Archipelago, and conferring upon that Power a preponderating influence over both political and commercial relations in those seas. It will be so constituted as to merge in the dominant Slav majority a considerable mass of population which is Greek in race and sympathy, and which views with alarm the prospect of absorption in a community alien to it not only in nationality but in political tendency and in religious allegiance. The provisions by which this new State is to be subjected to a ruler whom Russia will practically choose, its administration framed by a Russian Commissary, and the first working of its institution commenced under the control of a Russian army, sufficiently indicate the political system of which in future it is to form a part.

"Stipulations are added which will extend this influence even beyond the boundaries of the new Bulgaria. The provision, in itself highly commendable, of improved institutions for the populations of Thessaly and Epirus, is accompanied by a condition that the law by which they are to be secured shall be framed under the supervision of the Russian Government. It is followed by engagements for the protection of members of the Russian Church, which are certainly not more limited in their scope than those articles of the Treaty of Kainardji upon which the claims were founded which were abrogated in 1856. Such stipulations cannot be viewed with satisfaction either by the Government of Greece or by the Powers to whom all parts of the Ottoman Empire are a matter of common interest. The general effect of this portion of the treaty will be to increase the power of the Russian Empire in the countries and on the shores where a Greek population dominates, not only to the prejudice of that nation, but also of every country having interests in the east of the Mediterranean Sea.

"The territorial severance from Constantinople of the Greek, Albanian, and Slavonic provinces which are still left under the Government of the Porte will cause their administration to be attended with constant difficulty, and even embarrassment; and will not only deprive the Porte of the political strength which might have arisen from their possession, but will expose the inhabitants to a serious risk of anarchy.

"By the other portions of the treaty analogous results are arrived at upon other frontiers of the Ottoman Empire.

The compulsory alienation of Bessarabia from Roumania, the extension of Bulgaria to the shores of the Black Sea, which are principally inhabited by Mussulmans and Greeks, and the acquisition of the important harbour of Batoum, will make the will of the Russian Government dominant over all the vicinity of the Black Sea. The acquisition of the strongholds of Armenia will place the population of that province under the immediate influence of the Power which holds them; while the extensive European trade which now passes from Trebizond to Persia will, in consequence of the cessions in Kurdistan, be liable to be arrested at the pleasure of the Russian Government by the prohibitory barriers of their commercial system.

"Provision is made for an indemnity, of which the amount is obviously beyond the means of Turkey to discharge, even if the fact be left out of account that any surplus of its revenues is already hypothecated to other creditors. The mode of payment of this indemnity is left, in vague language, to ulterior negotiations between Russia and the Porte. Payment may be demanded immediately, or it may be left as an unredeemed and unredeemable obligation to weigh down the independence of the Porte for many years. Its discharge may be commuted into a yet larger cession of territory, or it may take the form of special engagements subordinating in all things the policy of Turkey to that of Russia. It is impossible not to recognize in this provision an instrument of formidable efficacy for the coercion of the Ottoman Government, if the necessity for employing it should arise.

"Objections may be urged individually against these various stipulations; and arguments, on the other hand, may possibly be advanced to show that they are not individually inconsistent with the attainment of the lasting peace and stability which it is the highest object of all present negotiations to establish in the provinces of European and Asiatic Turkey. But their separate and individual operation, whether defensible or not, is not that which should engage the most earnest attention of the Signatory Powers. Their combined effect, in addition to the results upon the Greek population and upon the balance of maritime power which have been already pointed out, is to depress, almost to the point of entire subjection, the political independence of the Government of Constantinople. The formal jurisdiction of that Government extends over geographical positions which must, under all circumstances, be of the deepest interest to Great Britain. It is in the power of the Ottoman Government to close or to open the Straits which form the natural highway of nations between the Aegean Sea and the Euxine. Its dominion is recognized at the head of the Persian Gulf, on the shores of the Levant, and in the immediate neighbourhood of the Suez Canal. It cannot be otherwise than a matter of extreme solicitude to this country that the Government to which this jurisdiction belongs should be so closely pressed by the political outposts of a greatly superior Power that its independent action, and even existence, is almost impossible. These results arise not so much from the language of any single article in the treaty as from the operation of the instrument as a whole. A discussion limited to articles selected by one Power in the Congress would be an illusory remedy for the dangers to English interests and to the permanent peace of Europe, which would result from the state of things which the treaty proposes to establish.

"The object of Her Majesty's Government at the Constantinople Conference was to give effect to the policy of reforming Turkey under the Ottoman Government, removing well-grounded grievances, and thus preserving the Empire until the time when it might be able to dispense with protective guarantees. It was obvious that this could only be brought about by rendering the different populations so far contented with their position as to inspire them with a spirit of patriotism, and make them ready to defend the Ottoman Empire as loyal subjects of the Sultan.

"This policy was frustrated by the unfortunate resistance of the Ottoman Government itself, and, under the altered circumstances of the present time, the same result cannot be attained to the same extent by the same means. Large changes may, and no doubt will, be requisite in the treaties by which South-Eastern Europe has hitherto been ruled. But good government, assured peace, and freedom, for populations to whom those blessings have been strange, are still the objects which this country earnestly desires to secure.

"In requiring a full consideration of the general interests which the new arrangements threaten to affect, Her Majesty's Governments believe that they are taking the surest means of securing those objects. They would willingly have entered a Congress in which the stipulations in question could have been examined as a whole, in their relation to existing treaties, to the acknowledged rights of Great Britain and of other Powers, and to the beneficent ends which the united action of Europe has always been directed to secure. But neither the interests which Her Majesty's Government are specially bound to guard nor the well-being of the regions with which the treaty deals would be consulted by the assembling of a Congress whose deliberations were to be restricted by such reservations as those which have been laid down by Prince Gortchakoff in his most recent communication.

"Your Excellency will read this despatch to the Minister for Foreign Affairs, and give him a copy of it.

"I am, &c.,

"SALISBURY."

PRINCE GORTCHAKOFF'S REPLY.

(From a London paper of April 11.)

The reply of Prince Gortchakoff to the Circular of the Marquis of Salisbury has been telegraphed from St. Petersburg, and is, of course, of the utmost importance at the present moment. It was indeed scarcely expected so soon, there being a notion that it would be withheld until the Russian Chancellor had made himself acquainted with the general tone of the debates in the English Parliament. But this has not been considered necessary. The reply consists of twelve articles. Its tone is moderate, and even conciliatory; and takes up in due order the principal points and objections raised by our Foreign Minister—combating their objections, but iterating and reiterating that Russia had no thought of excluding Europe from considering the entire plan as sketched in the preliminary Treaty of San Stefano.

The first article deals with Bulgaria, and declares Lord Salisbury's assertion incorrect that the Treaty of San Stefano has created a new Bulgaria. It is said to be equally incorrect to say that the new State will be a Slav province, under the control of Russia. Bulgaria exists already; and the Treaty of San Stefano has only rendered obligatory the consent of Turkey to a programme of reform more complete, more precise, and more practical than that adopted by the Constantinople Conference. The fact of the Treaty being preliminary showed that it dealt only with the question of principles, without pre-judging the definite application of those principles, which was a matter requiring technical study. Many of the articles of the Treaty had been left vague, which left room for ulterior understanding about modifications which might be judged indispensable. The second article denies that the new province is placed under the control of Russia. It will be exactly in the same position as Moldavia and Wallachia in 1830. The third article deals with the length of the Russian occupation. It says the maximum term of two years had been assigned for a provisional occupation, because it was considered necessary for peace, order, and protection to the Christian and Mussulman inhabitants; but that time was only approximate, and, therefore, Russia was ready to abridge it so far as the task she had undertaken and the general peace would permit. The fourth article states that the delimitation of Bulgaria was only fixed in general terms, and defends the extension of the province to the Black and Aegean Seas as necessary for the commercial prosperity of Bulgaria. The fifth article denies that the new Prince of Bulgaria will in any way be chosen under pressure from Russia. He is to be elected by the native administrative council, with the consent of the Porte and Europe. The sixth article takes exception to the statement that Russian influence is extended by the stipulations regard to Epirus and Thessaly. If Russia had not asked for something in favour of these provinces, she would be accused of sacrificing the interests of the Greeks to those of the Slavs. If she had proposed in their behalf a vassal autonomy, she would be censured as destroying the Ottoman Empire, and implanting Russian influence. Russia had only acted in the spirit of that protectorate mission which history had assigned to her in the East. Article 7 defends the provision made in favour of the Russian Church. Article 8

deals with the retrocession of Bessarabia. It denies that this demand can interfere with the freedom of the navigation of the Danube, since that is now placed under an international agreement. Besides, the retrocession demanded does not include the whole of Bessarabia ceded in 1856. The Delta of the Danube is excluded, and the intention of the Russian Government is to return it to Roumania, from whom it had been retaken in 1857. This circumstance considerably reduced the importance of the retrocession with regard to its influence on the navigation of the Danube. Article 9 defends the acquisition of Batoum as the only port in that region convenient for Russian commerce. The tenth article is not included in the published document, probably owing to some mistake of the telegraph. Article 11 deals with the question of the indemnity. It defends the indefinite terms on that point on the ground that immediate payment would interfere with the rights of other creditors of the Porte, and would deprive Russia of the guarantee on the part of Turkey for the observance of her pledges which was necessary. Article 12 deals with the assertion that the San Stefano Treaty infringes existing treaties, and points out the many instances in which these Treaties have already been violated. First, they were infringed by Turkey's non-fulfilment of her pledges, then by the Principalities, then by the French occupation of Syria, next by the Constantinople Conference itself, which was an interference with the independence of the Ottoman Empire; and lastly by the question of the Straits. Finally, a complaint is made in this article that Lord Salisbury's despatch proposes no alternative to the policy it attacks.

CORRESPONDENCE.

THE MITSU BISHI COMPANY. II.

To the Editor of the Japan Times.

Sir,

If you will grant me sufficient space, I purpose reviewing the position and prospects of the Mitsu Bishi Company, and will endeavour to point out the inefficient manner in which the affairs of the Company have been managed and the detrimental effect the same is having on the trade of the country, injuring instead of benefitting the development of the coast trade and defeating the object the sagacious statesmen who established this Company had in view.

The Shanghai branch line of the Pacific Mail Co. was purchased in its entirety by the Mitsu Bishi Company in 1875 after the settlement of the Formosa question.

Iwasaki and his brother mysteriously leaped into prominence and undertook the management of the Company; all that had been known of them previously was, that they had been interested in some small "rattle trap" steamers running between Osaka and Tosa.

For a sum of about 800,000 yen the Mitsu Bishi Company acquired the following steamers

<i>Costa Rica</i>	now	<i>Genkai Maru.</i>
<i>New York</i>	"	<i>Tokio Maru.</i>
<i>Nevada</i>	"	<i>Saikio Maru.</i>
<i>Oregonian</i>	"	<i>Nagoya Maru.</i>
<i>Golden Age</i>	"	<i>Hiroshima Maru.</i>

and in addition, a fine property in Shanghai including offices godowns, wharves, &c. at present valued at some \$150,000, also iron store-ships at Nagasaki and Kobe together with moorings, buoys, &c.

Commencing with such a bargain and a mail subsidy of some \$20,000 per month, for carrying on an average about thirty bags of mails, a distance of some 1,200 miles, and with an efficient and peculiarly adapted fleet, nothing but prosperity appeared to await the Company's undertaking.

Everything was in its favour: the Satsuma rebellion of last year is stated to have added no less a sum than 5,000,000 yen to the Company's receipts, for services extending over some nine months only. The mail line to Shanghai continued running without interruption during the rebellion and the services rendered by the Company to the War Department, as an equivalent for the above amount, was performed by the

outside steamers of the Company, these vessels also being supplied with coal at the expense of the War Department, so that the earnings of these steamers must have been almost clear profit.

The following is a list of the Company's steamers that were principally employed during the war: the aggregate value of the lot as they stand being not over 650,000 *yen*, so that if the amount stated above is correct, the M. B. Co. received 8 times the value of the vessels employed.

This fleet was increased last year by the purchase of the following steamers, in England, but very few of these vessels arrived in time to be of actual service during the war.

	Tons.	Built in	Purchased at about
<i>Montgomeryshire</i>	1,146	1873	\$175,000.00
<i>King Richard</i>	1,133	1875	\$175,000.00
<i>Gadshill</i>	1,240	1875	\$175,000.00
<i>Duna</i>	752	1871	\$130,000.00
<i>Lotus</i>	1,407	1873	\$210,000.00
<i>Candia</i>	1,348	1854	\$150,000.00

Not one of these steamers, in my opinion, is suitable either for the Japan or China coast trade. They are all, comparatively speaking, as times go, costly vessels; not economical, either as regards working, consumption of fuel, or general handiness.

In contra-distinction to them in these respects, there are now on the China coast, new first class steamers which carry almost as much "dead-weight" as any of the above steamers, on a light draught of water, with a consumption of eight tons of coal, and average speed of nine knots: and these cost about half what the above steamers cost, and are worked at one half the expense.

The recent additions to the Mitsu Bishi Company are not new, but comparatively old vessels, for the boilers of the *Duna* are worn out, and those of the *Montgomeryshire*, *Lotus* and *Candia* cannot be expected to last more than two years and the *Gadshill* and *King Richard* more than four years.

Universal experience has most conclusively proved the tinkering up of old steamers to be a grievous mistake; Mr. Iwasaki, not content with this verdict as regards Japan, has squandered vast sums of money in endeavouring to prove the contrary in a country where material and skilled labour is costly, and some of the vessels so experimented upon would be dear as a gift.

The *Behar* and *Delta* have been repaired at a cost for new engines and boilers alone, which would have enabled the Company to obtain three or four first-class suitable steamers; these vessels will have been some two years undergoing repairs, inclusive of their voyage to England and back, and when they return, they will assuredly prove unsuitable for present requirements and not worth half the expenditure incurred on them. The M. B. steamers are, one and all, large consumers of coal; and to remove as far as possible the prospect of their being able to pay their expenses, the company have lately set to work and imported Australian coal at a price which can only show a profit to the importers. The reckless

and extravagant manner in which coals, stores &c. have been supplied by the Mitsu Bishi Company will well afford matter for another letter. But in the meantime, let me remark that the Company was established to assist in developing the national industries of Japan, and this was specially incumbent on them as regards coal, which forms the most serious item in the economy of a steamer. It so happens that the steamers of the Mitsu Bishi Company (like other Companies' steamers in China) have had the combustion fittings of their boilers specially arranged to burn small and cheap coal, yet with all this, a question of private pique (for it can be accounted for by no other means) between the proprietor of the Takashima mines and Iwasaki, is allowed to stand in the way, coal in large quantity at great cost is imported from a foreign country, and the interests of the Mitsu Bishi Company are sacrificed.

The serious responsibility resting upon them, as managers of one of the most powerful arms of Japan, appears never to have been recognized or felt by the Iwasaki brothers. At one moment, nothing would satisfy them except the Company must have a Dry Dock specially constructed for their own fleet, regardless of the cost of such an undertaking and the fact, that in proportion to the shipping running on the coast, Japan, in this respect, is better supplied than most other countries in the world. Then the next whim was an Insurance Company; I would ask, if they have so signally failed in the management of the Steamer Company, what would have been the present state of the Insurance shares, if this had been tacked on as an adjunct to the Mitsu Bishi Company?

The China Merchant Company, a few years since, found the only way to tide over difficulties they encountered when first starting, was to attach an Insurance Company, this was done, and some 200,000 *taels* of Insurance capital was thrown into "hotch potch" and with what result? That when the two steamers were lost last February, the Insurance Company made it an excuse for not paying even interest to its shareholders. Consequently foreign, not native managed Insurance Companies now possess the confidence of the wealthy Chinese.

Thus enjoying a complete monopoly of the Coast trade of Japan, of both goods and passenger traffic, supported by a liberal subsidy and extraordinary facilities, the result of 3 years working is semi-bankruptcy, if we are to believe the statement of Mr. Iwasaki. The Pacific Mail Company without any such advantages, managed to work the steamers on this line to show a net profit of some \$15,000 per month.

The policy of the Mitsu Bishi Company, instead of facilitating the trade of the country, has had a directly opposite result, and has contrived to choke and almost destroy it.

The following comparison between the rates of freight ruling for some months past between England and the East, and the revised rates of the Mitsu Bishi Company will justify the assertion.

Freight by 1st class steamers between England and China, say 15,000 miles, \$7.50 per ton. Freight between Yokohama and Hakodate say 600 miles, \$6.00 per ton.

Such rates as charged by the Mitsu Bishi Company are prohibitory, and the farm producers are actually worse off with a good crop than with a bad one, for they cannot get their produce to a market, and naturally have to submit to sacrifice it at such prices as will not pay them. Again, the continuance of such a scale of freight will be the means of bringing more foreign steamers to run on the coast, and will also lead to other combinations amongst the Japanese, who can now have the advantage of procuring economical and suitable vessels which must compete to the disadvantage of the Mitsu Bishi steamers.

The junk trade of the country is also reviving under the oppressive and misapplied monopoly of the Mitsu Bishi Company, and if in lieu of the ineffective square-sail, junk owners can be persuaded to alter the rig of their vessels to a somewhat similar rig to that employed by the Chinese, this opposition will be found to be formidable. For besides expediting and facilitating the coast trade of the country, it will make the junkmen more experienced seamen, teaching them greater self-reliance and confidence, also tending greatly to the security of life and property afloat.

It is as well that the Japanese should bear in mind that, in adopting foreign vessels or foreign models and systems, —naturally it is to be expected that foreigners should know how to handle these, better than Japanese who have

had no such experience, and that seamanship and presence of mind amidst the difficulties and dangers that surround a sailor's life cannot be learnt in a day by "rule of thumb."

Not satisfied with crying down the Mitsu Bishi Company, Mr. Iwasaki must needs attempt to throw discredit on the National Loan, by immediately afterwards offering to subscribe 500,000 yen.

It would seem by this action, that, whatever misfortunes have overtaken the Mitsu Bishi Company, these at all events have contributed to the enhancement of Mr. Iwasaki's private fortune, to such a degree as to enable him to contribute a large amount to the National Loan, otherwise it can only be looked upon as a farce, or else that the published statement was without foundation.

I purpose continuing my criticism of this Company, and remain,

Sir,

Your obedient servant,

NAUTICUS.

YOKOHAMA: SATURDAY, JUNE 8, 1878.

NOTES OF THE WEEK.

FRIDAY EVENING, June 7th 1878.

THE *Volga*, bringing the Marseilles mail of the 17th of April, arrived in harbour this evening two days behind time. The *Malacca*, bringing the English mail of April 26th, left Hongkong on the 4th inst. and may consequently be expected here early next week and up to her schedule time, notwithstanding the accident to the *Khetice*. The latter vessel on her way to China from Galle, came into collision with the Dutch mail steamer *Fourwinds*, injuring her bows to such an extent as to necessitate her docking in Singapore: her mails were brought on to Hongkong by a Holt's line steamer. The *Gordic* may also be expected early in the week from San Francisco, having left there on the 18th ulto. The *Suncho* with the home mails left on Wednesday last, and the *Belgie* was despatched this morning at daylight for San Francisco with a full complement of cargo, principally tea for the States. We hear that the cargo room of the next outgoing American steamer is fully engaged. Two mail steamers from Shanghai and coast ports arrived during the week, the *Nagoya Maru* and *Saikio Maru* on the 2nd and 6th inst. respectively, the *Nagoya Maru* leaving on the outward trip on Wednesday last. One inward and two outward mail steamers from and to Hakodate complete our mail steamer intelligence for the week. A sailing ship, called by the auspicious name of *Fair Leader*, is making an extraordinary long passage, she left London for this on the 25th of September last year, consequently she has already been eight and a half months on her voyage. She passed Anjer April 3rd.

The preparations for the Regatta are progressing, we believe, as fairly as such things can progress in Yokohama, where man has to strive against weather. So far as we can learn, the preparations consist in the procurement of the *Thabor* as a flag-ship, which is kindly lent by the Lighthouse Department. It is not in the best position possible, but it is the only ship available, and as her accommodation is very good, her fittings very elegant and her officers attentive, we hope there will be a pleasant day. We are glad to hear that by the kindness of the French Admiral, the band of the *Armide* will attend, so though the sea may be rough and prevent rowing, at least our lady friends will be able to dance. The race of the day will be the race for open boats 20 feet and over, for which there are twenty-two entries. The Russian contingent is very numerous and their cutters are in full practice, the *Vladnick* cutter which seems the best of them, has a good chance of winning. A prettier sight than the start for this race will be rarely seen by residents in Yokohama, these twenty boats hoisting sail at the same time. Among the Rowing races, the Champion Pairs will produce a good race between the holders and the brothers Dare, who proved the better of the Challengers in a pretty race on Wednesday last; for it was a pretty race, though the crews

were not evenly matched and proved a closer finish than was expected. The Dares led from the commencement, rowing well within their strength, they eventually won by two lengths. About the end of the first half mile, Messrs. Playfair and Lilburn began to draw up to them, but could not catch them, want of condition and want of practice began to tell, and though they pluckily held the Dares until about a quarter mile from home, the latter then began to draw away. Before this paper is issued in Yokohama, the Regatta will have been finished, and a prophecy on the result of the various races will be useless, but in the Champion Pairs our fancy is for the Challengers, as they are better together and have more practice than the holders, whom we have scarcely seen. The Fours, Mr. A. H. Dare ought to win; he is fortunate in having the best boat in the Club, and those who know the pull a new boat has over an old one, will appreciate his advantage, and though handicapped with a penalty of a length, it ought to serve him to win. Mr. J. J. Dare is the favourite, but judging from the improvement shewn by the other boats in the last few days, there is a chance of the certainty being upset.

The news by wire from Europe received since our last are of importance. The best informed European publicists have always been of opinion that this last Russian attack upon Turkey was forced upon the Emperor against his will; and it appears now extremely doubtful whether the Russian armies can be withdrawn from the neighbourhood of Constantinople without the crowning triumph of having occupied it, except at the cost of revolution and dethronement of the Romanoffs. From the telegram which reached us on the 5th inst. we learn that the simultaneous withdrawal of the British fleet to Besika Bay and of the Russian troops to Adrianople had been insisted on by England as a preliminary to the Berlin Conference; and that the Russian Press had expressed disapproval of such a concession being made by Russia. This is certainly menacing to the prospects of peace from whatever point of view we regard this statement about the Russian Press. Ordinarily, the Russian Press is held under far stricter supervision than the Japanese—and, if this bondage is as severe as ever, the dissatisfaction expressed may have been permitted, to give the government an excuse to refuse withdrawal of the troops, which means war, deliberately accepted by the Imperial family: should the Press have so far broken loose as to be able to make independent utterance of such sentiments, then this means war again, but with the Romanoffs driven into it against their will, on pain of dynastic destruction. The only thing about which there is no doubt or possibility of mistake is—that the Salisbury dispatch, the sailing of troops from India, the calling out of our Reserves, and the movements of our fleets have made England mistress of the situation. The telegraphic messages received during the week:—'Russia and Great Britain are agreed as to the basis of the negotiations to be discussed at the Conference'—'a preliminary to the Conference is the withdrawal of the Russian Troops to Adrianople'—and the cessation of excitement in England all tend to prove this. And as Lord Beaconsfield has never, throughout the whole period from the Constantinople Conference until now, wavered for a moment in his determination to uphold the Treaty of Paris, we can anticipate with great ease the 'basis of the negotiations' referred to. 'Vaulting ambition hath o'erleap'd its selle, and fall'n o' the other side.'

The news that the Emperor of Germany has been again attacked by a Socialist assassin, and this time slightly wounded, shows us that our boasted European civilization is not free, either, from the noxious weed of political murder. Our great men are better guarded, though—or our murderers have a greater regard for their own chances of escape than in Japan, and German citizens here have not to mourn the loss of their great Emperor. Another terrible loss, though, has overtaken the Empire: that of the *Grosser Kurfurst*, one of the four iron-clads possessed by its infant navy, which has sunk in the Straits of Dover, from the effects of a collision with a companion vessel, drowning officers and men to the number of three hundred. Friends in Japan of Count Monte, the hospitable Captain of the *Vineta*, who was well known and liked in Yokohama, will hear with great regret that he was among the victims of the accident. The loss of the vessel itself is also a severe one, her tonnage being over 4,000 tons register, and she being a fine brand-new ship built and armed on the best and latest models.

We have fortunately no such accident to record in our part of the world, though the week has not passed without bringing us news of disaster. An immense amount of damage appears to have been done in Hongkong and its vicinity by a rain storm of very unusual violence, which raged there during the early hours of the 22nd of May and of which we now get the details. Nine-and-a-half inches depth of rain-fall was suffered during less than two

hours; and naturally the impact of so many thousand tons of water made great havoc with roads, drains, and foundations of houses. We chiefly regret the almost entire destruction of the nurseries of young trees and young plantations which we have lately had so much pleasure in noticing. Nearly half of the Japanese seed sown had come up, and the whole of this has been washed away. Afforestation in tropical climates is by no means easy work.

We mentioned, last week, the competitors in the ocean race with new teas, from China to England, and named the *Glenwagles* as having got away first. The *Loudoun Castle*, which followed her, was delayed in the river by getting aground and consequently did not pass the starting point, the Red Buoy at Woosung, until fifty hours after the leading ship. We shall have particulars of the departures of all the rival steamers, we expect, by next week, when we will tabulate them for record.

An unusually interesting cricket-match has been played during the week, begun on Monday, and finished this afternoon. The Club and the Navy was the match, and with so many men-of-war in harbour, a much better team came on shore than is usually seen. According to the rules, the Navy won; as the match was not finished on the first day, and the first innings showed a score of 60 for them against 59 for the shore eleven; but as it was only 4.15 when the first innings was over, it was agreed to play out the match, finishing it to-day. In the Club's second innings, Mr. Trevethick, a very slashing hitter lately up from Kobe, distinguished himself by quite over-powering the bowling and getting 64 runs with only one chance. Three other batsmen's scores running into double figures, a total of 128 was put together for the club's second innings, and this afternoon, consequently, the Navy had to go in to make 127 to tie. This they have completely failed to do—coming on shore only 8 strong, and putting together only 25 runs.

Again an impudent robbery, effected without the least interruption from the native police, has demonstrated the necessity of municipal reform in this particular. Readers in better-governed communities than Yokohama will hardly believe the following details of this robbery, yet they are strictly true. The double doors of a godown, giving on to a well-frequented street, and secured by two padlocks, one exceptionally heavy, were broken open—the padlocks being removed by hammer and chisel—five bolts of canvas carried off and a larger quantity piled just within the door, waiting removal. These goods must have been carried in a cart or *jinricksha*, and yet the police do not appear to have acted as the slightest check to the removal of the goods. The utter lack of protection of this town during the night by the Japanese police is simply scandalous, and why the Consular Board do not take some action is very surprising. The ground rents should be withheld. The writer's avocations, and certain frequent fits of *insomnie* have, during the past six months, caused him to walk a number of miles between midnight and dawn both round and through the settlement, and on the Bluff, and his opportunities of noticing the behaviour of the police have been unusually good. Never has he seen a policeman doing his duty on his beat as it should be done! In rainy weather, cowering in sheltered corners, or crouched down in doorways; in fine weather, leaning dozing against walls, but never moving like policemen anywhere else, from one end of a beat to the other. Meanwhile suspicious figures are flitting about, *jinrickshas* waiting for the plunder at convenient corners and ready to give the alarm if necessary, all without challenge, examination, or enquiry; no frequent inspector's rounds, not a glimmer of a bullseye, not the slightest evidence of watch and ward. And of course week after week, such robberies as this we record to-day take place: burglaries clumsily executed, by simple main force, and with the rudest tools, and which,—including the transport of the 'swag' must take almost hours to transact. These circumstances justify, even, strong suspicions that the police, the burglars and the *jinricksha* men are all in league together. Surely such a state of things calls for diplomatic remonstrance, if not more active measures. Or must the community appeal to their various Governments at home against the supineness of their representatives here?

The Grand Hotel, which was sold on Saturday last to Mr. Von Hemert, Agent for the mortgagees, for \$22,100, including all its furniture and fixtures, has, after passing—it was said—through second hands, finally been settled to-day in those of MM. Bonnat & Cie., the proprietors of the Oriental Hotel, and formerly we think, of the well-known 'Sweetmeat Castle' in Shanghai. MM. Bonnat have a great reputation to keep up, which we have no doubt they will do in their new venture. The Grand Hotel is a cheap bargain for them, and should give them excellent returns: we wish them success.

The purport of a conversation stated to have been held recently

between Li-Hung-Chang, and H. E. Arinori Mori, Japanese Minister at Peking, has gone the round of the Japanese and foreign press; the whole subject is doubtless a "squin" although on the face of it carrying a certain air of plausibility; even if it were true we question the taste of foreign journals attempting to throw discredit on the Japanese Government, by commenting on the foreign policy of the Government on matters which can only concern the parties interested. We shall have more to say on this subject next week.

NOTES AND QUERIES.

QUERIES.

Qy. 6. Can any of your readers inform me whether there are any, and if so, what books on Japanese surgery, or midwifery, as practised before the coming of the Dutch and Portuguese? (Unanswered.) Z.

Qy. 8. Mr. Bramsen's interesting note on the relative values of coins in your issue of February 23th, leads me to think that he or some one else may possibly be good enough to clear up a few points which have frequently occurred to me:—

1.—Can any one say when, and under what circumstances, paper money was first issued in Japan? "Shosei" in your issue of March 9th gave a most interesting account of the *Han* paper money; and perhaps if there were a general issue before that, some other student may be able to do the same for it.

3.—Can any account be got of the regulations (if any) which governed coining under the feudal system? For instance, under what circumstances was permission granted to certain individuals to strike coins? This seems to have been done at various parts of the country, thus we have Musashi Ichibu, Suruga Koban, &c. (Unanswered.) X.

Qy. 10. Can any of your medical or other readers inform me of the recent existence of cases of poisoning resulting from the use of bread made from impure wheat; the symptoms being those described in works on Medical Jurisprudence, as arising from the presence of the *Lolium temulentum* or Darnel grass (or other poisonous *gramineæ*) viz; Gastro intestinal derangement, narcotism, vertigo and convulsions. (Unanswered.) R. N.

Qy. 12. In Jules Verne's work, entitled "Michael Strogoff, the Courier of the Czar," occurs a paragraph which touches upon the disposal of political exiles in Siberia. Speaking of their concentration at Irkutsk, during one of the Tartar invasions, he says "some are doctors, others professors, either at the Japanese school or at the School of Navigation." One does not of course, expect absolute accuracy in a novel, but is our ingenious author not a little adrift here! I shall however be glad to know if such an institution really exists. (Unanswered.) M.

THE JAPANESE PRESS.

THE POSITION OF JAPANESE TEAS.

(From the 'Chiu-gai Bakka Shimpō'.)

THIS year the trade in New Teas has commenced earlier than usual; the first was brought into Yokohama on April 22nd., since which date more than a month has elapsed, and the amount brought into the place during the period is about 2,000,000 *kin* (20,000 piculs.) The current price of the first parcels was \$55, but it soon fell to \$44, or \$45, then to \$40, again to \$35 and lately it has come down to only \$27 or \$28. Such a speedy fall is indeed unusual, and no one can fail to be surprised at it; and that especially the proprietors of tea farms should be uncertain how they should act in future, is not unreasonable.

When we ourselves inspected the new teas of this year in Yokohama, we perceived them to be so carelessly prepared, and their quality to be so bad, having no brightness in the leaf, deficient in weight and safely to be grasped in the hand,*—that we could not feel certain that they were new.

* A native test is by grasping the leaves in the hand: the new leaf is hard and will break. Old tea is flabby and will not.

They were said to come from Omi, Suruga, Totômi, Musashi, Kadzusa and Shimôsa, and their price was stated to be \$30. Thus we discovered, for the first time, the cause of so considerable a fall in market prices this year.

Six or seven years ago, the writer was in Yokohama and connected with the tea trade there, and having personally dealt in teas from various places, remembers that, at that time, Omi, Suruga, Totômi &c. used to produce pretty well the best teas; but the quality of this year's tea is so bad, that he can only believe that they are not the product of the same places. The price of about \$30 for this quality of tea is certainly not low; and we are therefore reduced to say that 'the recent fall in market value of Tea is not a fall in price, but a fall in quality.'

That the quality of the Tea produced has become so bad is due to the fact that, the production of tea in China, India, and Japan having yearly increased, and their price having gradually lowered, producers have become unable to give their full attention to manuring the ground and growing the plants; and, as the amount of production has increased, they have endeavoured to curtail the amount of labour. For instance, producers, who have hitherto been used to grow tea on one or two *tan** were able to pick and prepare the teas with only the labour of their own families and were then able to give full attention and care to the growing and preparation of the teas. But since they have increased the quantity of tea produced, the trade having been so prosperous for a time, they have been unable to manage the picking and preparation with the staff of their own families, and thus it has become necessary to hire other labour. But for the hire of a labourer, they must pay 30 or 40 *monme* a day; and then, as the market gradually became dull, feeling uneasy respecting the disposal of their product, and anxious to curtail expenses as much as possible, they now let the labourer, who used to prepare but one or two *kwamme* per day, (a *kwamme* is about 8½ lbs avoirdupois) prepare five *kwamme*. Thus they have been obliged to permit the quality to deteriorate; and, furthermore, as foreigners, lately, have constantly sought to purchase only the cheap teas, the makers have become more and more careless in preparation, and do not seem to perceive that their reputation and value will, some day, be entirely lost. So, as the price falls, quality becomes inferior; and then, as the quality deteriorates, again the value is lowered; this is unavoidable, and can only be deeply regretted. So we have always argued, regretting the failure of our tea export.

And now about Black Tea. The object we had in view when we recommended the production of this, was not only to do this, but to promote the manufacture of anything which seemed to promise profit, so as to redeem the previous failure. But the Uji made teas have now got down to such a low point that to restore them is indeed almost impossible (lit. most difficult of all the difficulties.) On the other hand, the making of Black Teas has lately become prevalent, as we have constantly been reporting, and in spite of the repeated assurances of the *Japan Times*—that 'the quality of tea in this country unfits it for being made into Black Tea,' samples of the first grade of the second class, sent to London, have obtained a valuation of more than one shilling (see No. 71 of this journal) and of those produced this year, if the quality is of the first class, foreigners are contending at Yokohama for its purchase at \$50 per picul and even 2nd class teas are selling at the current price of \$37 or 38 per picul. This Black Tea being inexpensive in its preparation, whilst its selling price is high, compared with that of the Uji make, the difference in profit is about \$10 per picul. But the reason why this Black Tea has so good a reputation and value now, is certainly not from a fortunate chance only, but because of the fact that—not to speak of those who went to India to learn to make Black Tea, but also those who have learnt from them, are striving to produce really good quality, though knowing that in the end it may be unprofitable to give so much care to it. But should they, on account of the temporary demand, strive to produce larger and larger quantities, and should there be any lack of care in its preparation, then they will at once see it follow the same path as the Uji made tea. We therefore strongly urge on those who are concerned in the production of Black Tea that they should always keep up their present carefulness of preparation, and guard against affecting the state of the market in the future by producing inferior qualities.

Though, as we have said, it is an exceedingly difficult

matter to restore Uji made teas to their former position, still there are means of doing it. But it cannot be done by any assistance that Government can give; and it is better, indeed, that Government should not interfere, but leave the people to themselves. The only means of restoration is that the parties concerned should earnestly strive to produce as good a quality as possible, export it direct to America and other countries, let the people there taste the real flavour of our properly made tea, and thus induce a liking for it; and thereafter, let the profit made by the operation be publicly known.

We earnestly beg our readers who are interested in the article to strive and help in this direction, instead of idly looking on at the decadence of our tea trade, which is one of the most important industries of the country. We, for our part, undertake to pay our utmost attention to investigating the actual state of the markets, and will not fail to report the same from time to time.

COMMERCIAL EDUCATION

(From the 'Chingai Bukka Shimpô'.)

ALTHOUGH the public is fully aware of the importance and urgent need of commercial schools, we have not yet heard of any single practically useful one being established. Looking back to the times before the Restoration, we remember that, though there were no schools of this kind, parents who intended their children for merchants used always to send them, at the age of six or seven, to schools where they could receive the ordinary education in reading, arithmetic and writing; then, when they had reached the age of ten, they would be sent to some suitable merchant's house, as apprentices. Here they would become experienced in the management of goods, versed in book-keeping, learn how to write invoices, and how to receive or visit customers, &c. &c.—and, at the same time would devote themselves to study and reading the books, writings, and mathematics necessary for merchants to know. Thus having, step by step, gained experience in business transactions in a practical way, they became merchants. This was the custom prevalent in all parts of the country at that time, and, in fact, apprenticeship served as a school for the study of the practice of trade. The ordinary tradesmen of our country at the present time have all been through this course, but those who have been *shizoku*, and are now become merchants, have no such knowledge or practical experience, and as they merely act, in business, on their judgment alone, they often fail. This is certainly not wonderful. In former times, our laws were not so strict as they are now, business was transacted only within the country; the national mind was more restful, and trouble in business did not readily occur. And as morality was generally regarded, if one man took an action against another into court, his neighbours, without ascertaining whether he was right or wrong in so doing, did not like to do business, or associate with him, thereafter. Thus the method of education then followed was found to be sufficient, and nothing more was wanted; but the present mercantile community is in a far different state; the laws have become more and more strict, foreign trade has flourished and, consequently, the manner of transacting business has undergone a change, and the variety of goods now dealt in has greatly increased. It is therefore beyond doubt that the knowledge to be gained in the old fashion is now insufficient for the proper transaction of business. The present elementary schools being simply improvements on the old ones as regards the course of study, these are only useful for educating children. Apprenticeship, which, in former times, was looked on as a practical school, is now no longer so; because, in former times, during apprenticeship, boys got no salaries (except very rarely) only receiving suitable dresses for separate seasons; and their parents, though they sent their children to be so employed, did it with the object that they should acquire knowledge, and they were regarded as students. But it is not so now. Though parents speak of sending their children as apprentices, to gain a knowledge of business; in reality, they only seek a salary. And on the other hand, employers, wishing to make some use of them in return for the salaries paid, only employ the boys in doing what they are accustomed to and can most usefully do, and thus there is no time for them to acquire general knowledge of mercantile matters. Therefore, at present, it is hopeless to think of becoming a merchant by serving an apprenticeship. We

* A *tan* is 300 *tesubos* or 10,800 square feet, about a quarter of an acre.

have lately heard of the establishment of several mercantile schools. This is, indeed, good news; but we cannot avoid doubt, because the wonder to us is—though the schools are established, how are the children to be taught? Are the old books to be used? These are of no value at present. Are the pupils to learn only book-keeping? Then they will only be useful as Bank accountants. Are translations of English and French mercantile books to be taught? Such are only of use to commercial lawyers. Shall the commercial science of Europe and America be taught by foreigners? They would only make foreign merchants of the pupils, and render them unfit for practical business. For instance, we have actually observed that such as have learned, in schools, the foreign system of book-keeping, are well versed in the languages and have studied the methods of transacting business in other countries—not having been educated in the common Japanese way of doing business, are quite useless for commerce in the interior. On the other hand, those who have been through the course of instruction formerly mentioned, never having even dreamed of transactions with foreigners, cannot even make up an ordinary balance sheet. Merchants being thus all imperfect, cannot be said to be competent. And if matters are allowed to go on thus, as time elapses, —the old method of learning business by apprenticeship being discarded, men who have been so taught will gradually disappear; while the other class, though they may advance in science and theory, will only become conceited, and going farther and farther from practice, will be useless to the community. We therefore maintain that there is no use in establishing mercantile schools unless a proper system of teaching is employed, without which, no good result can be gained. It is, indeed, at present, of most urgent need that a proper system should be selected and decided on; and we earnestly wish that some of the enlightened gentlemen concerned in this direction would make themselves acquainted with matters connected with the home and foreign trade; and, picking out the necessary points, would compile and publish some Rules for Commercial Education, practically useful, and tending to improve the Japanese merchant of the future.

THE CHANGE IN CURRENCY OF COINS.

(From the 'Chiugai Bukka Shimpō')

OUR readers have doubtless understood, from the Government Notifications Nos. 12 and 13, published in all the newspapers of May 28th, that a great change has been made in the currency of our coins. Our Silver Trade Dollars having hitherto been coined merely for the trade at the open ports, have circulated, like the Mexican Dollar, only within the limits of those ports: they were not serviceable as current coin in the interior. But by the effect of these Notifications, they have become coin for general use, and can hereafter be used in paying taxes, and in all other business transactions, either public or private. The charge for coining them has also been reduced from $1\frac{1}{2}$ per cent to 1 per cent; the fixed amount of bullion receiveable by the Mint, which has hitherto been 1,000 ounces, is reduced to 500 ounces; and the period to elapse between receipt of the bullion and delivery of the coin, is reduced from twenty days to ten days. Thus a special advantage is given to the Trade Dollars; and indeed they are raised to the rank of standard, the same as gold. We respectfully suggest that the object of our government in making this change, and equalizing the charges for coinage on silver and gold (both being one per cent) is as follows. A special advantage being given to the silver coin (the expense of coining 1,000 ounces of Gold bullion being about 200 yen, whilst that of coining 1,000 ounces of Silver bullion will be only about 12 yen) notwithstanding the difficulties which actually attend the existence of two standard coins—we believe that, though the two standards will nominally exist together, the Government's policy is now directed to the object of making silver the standard actually. When the Mint was about to be established in Osaka, officers were dispatched to Europe and America in order to investigate the principles of coinage, who ascertained that the majority of opinions agreed that, at that time, it was indispensably necessary that Gold should be the standard; and these officers, having carefully studied the subject, and believed the correctness of this opinion, recommended the adoption of a Gold Standard to the Government. The Government approving their recommendation, accordingly made Gold yen the standard coin, and together

with the silver one yen, put them in circulation. There has, however, been not a little loss sustained whenever there has been fluctuation in the value of silver coin, and when considerable trouble had thus occurred, the Mint happened to get out of order, (lit. the coining machine happened to get broken) in consequence of which, the coinage of silver one yen pieces ceased, and thus gold coin became the only standard. But, subsequently, in order to have coin which would circulate in China and adjacent countries, and also to be a medium of exchange in the trade at the open ports; a silver Trade Dollar, equal in weight to the Trade Dollar of the United States, has been newly coined, and it seems that, now, the Government, seeing that there is considerable difficulty from the want of reliable coins in Hongkong, Singapore, &c., and conjecturing that this is a good opportunity for extending the circulation of our silver coins to these places, and making arrangements to export them to China—and perceiving also that gold is not practically suitable as a standard in Oriental countries, has entirely altered its policy. Gold coin being a standard, is not to be abandoned at once, but will be left for the present; and, nominally, both gold and silver are standards;—but, that, indirectly, by giving special advantages to the silver Trade Dollar, Government wishes to empower it to overcome the gold coin, is plain from the fact that it makes the coinage fees equal on both. Not only is this practised in our country, but it is so in others; for, in France and Germany, though gold coin is made the standard, yet silver coin circulates. Again, supposing our argument to be so far right;—advancing another step, and considering the future, and that at present it is unknown whether leaving both coins as standards may breed trouble: if we find that trouble is actually brought forth,—then we can decidedly abandon Gold, and make Silver the only standard.

Now, though in Foochow, Amoy, Hongkong, Penang, Singapore, Annam, &c., Spanish, Mexican, and the United States Dollars are all indiscriminately used, they are not in the same position; for the U. S. Dollar is not yet favourably received in the British territories, and the Spanish and Mexican Dollars—although they have been used in these places for some time, and are come to be looked upon as tolerably reliable coin—still, by reason of the countries where they are coined being so distant, they are not in sufficient quantity to meet the requirements of trade conveniently. Thus, at last, there being no reliable coins to be got, the people in China &c., are actually negotiating to apply to the British Government to again establish a Mint in Hongkong, to coin a British Dollar. But the British Government, having actually sustained a loss some time ago, it is certain that, however warmly the request may be urged, it is not likely easily to grant it. Now there being here, in Japan, which is so near, a great and extensive Mint, which can coin several millions of yen every day, and our country being midway to America, the native land of silver, there is a great advantage for our Dollar in the matter of freight, and further we are informed that there are foreigners in these places among the residents, who will greatly protect our Trade Dollars and are working indirectly to get them established. Now if at this time, we can contrive to extend the circulation of our silver Trade Dollars, it may be expected that they will overcome all others, and become the only current coin in all Oriental countries.

Leaving the question of foreign circulation, the Mexican Dollar has at present a great power in all our markets, and as we have often argued, this is an useless and injurious burden which we should take this opportunity to get rid of. Look at its actual current price! It has recently fluctuated more than one monme (1.66 per cent) in one day; and though this has been in great measure due to the balance of imports and exports being unequal, yet this frequent fluctuation is only caused by the action of speculators. And how great is the loss sustained thereby by the merchants engaged in the trade! This is really due to current coins being so scarce, and to their circulation being so limited. If, therefore, these were replaced by our silver Trade Dollar, speculators will be unable to interfere. For although their price may fluctuate a little, still as the extent of their circulation is widened, and their number will be great,—if the current price rises here, they will at once pour in from the interior, and if it falls, they will go out, and so the par value will at once be restored. And thus there will be no such injury as that sustained from the Mexican Dollar. This is what we firmly believe. If, therefore, merchants concerned in the

trade will at once direct their attention to this matter, and by a combined effort, endeavour to sweep away the Mexican Dollar and replace it by our own Trade Dollar, this will not only result in profit to themselves, but will not a little benefit, also, the country at large.

EXTRACT.

SANITARY PRECAUTIONS.

[This is Mr. Brunton's letter on the subject of drainage of Compounds, and care of the street drains, referred to in an Editorial Note on another page.]

To the Editor of the *Japan Times*.

Yokohama, 20th December, 1869.

SIR,—The Drainage works under my charge being now commenced with the prospect of an early completion, will you allow me to say a few words concerning them?

A pipe will be laid through the wall of each compound of a sufficient size and having a sufficient fall to carry off the sewage of that compound.

When that has been done, our work ceases and it rests with the proprietor of the compound to arrange the Drainage of his own place.

It is on this point that I am anxious—for the success of the work—to give a few explanations.

The sewage entering this pipe may be expected to come from three different sources. First from the Water Closets, Second from the Kitchen, and Third from the surface of the ground.

With regard to the First, as explained in my original scheme, the excrements from the dwellings cannot be permitted to enter the drain, without there is sent along with them a sufficient quantity of water to keep them in suspension, and so long as the present system of outside privies exists, the drainage works cannot assist in carrying off this part of the sewage.

As to the Second, a small connecting pipe leading to the bottom of a zinc lined tub fitted in the Kitchen, will greatly tend to keep the compounds clean by affording a place where dirty water may be thrown.

In regard to the Third, at a convenient spot, selected so that all the surface water may flow towards it, should be built a well somewhat similar to those built in the streets, and a pipe led from it to the drain pipe before mentioned.

The two latter are simple matters, entailing little trouble or expense in their execution, but in the case of the first rather an extensive change is required which many will hesitate to accomplish.

An elevated Water Tank with a force-pump to fill it from the well, will be required, as well as a regular patent Water Closet, which will discharge itself directly into the pipes.

I trust it will not be considered out of place if I attempt to impress upon the community the necessity for adopting some such system as this, and abolishing privies and all kinds of cesspools.

As early as the year 1845 it was, in London, a punishable offence to allow excremental or offensive matter into the sewers, they being used as simple water channels and being in most cases open. Up to that time it was the custom to look upon cesspools as the proper receptacles for excrements. Their walls were quite porous, so that the offensive liquids were continually percolating through them—saturating the soil, contaminating the water in wells and raising all manner of poisonous gases. A commission in 1845 reported to Parliament concerning the amount of sickness and death resulting from these contrivances, and this report was followed in 1847 by an act making it compulsory to drain all privy contents into the sewers.

In Yokohama, in some cases, cesspools are used for the reception of this class of sewage and in others it is allowed to remain in roughly constructed wooden boxes in the privies until periodically removed. Wells of a moderate depth are almost universal here and at no great distance from them is usually placed the cesspool or privy, and the water in them becomes tainted with the noxious sewage ingredients which find their way into it. In all soils there are veins which these wells cut, and through these veins they are supplied with water. When the cesspools also intercept these veins, the poisonous gases and atoms are carried by the water into the wells.

The poisoning of water or air is not necessarily perceptible to the taste or smell; cases are known where people have expressed a preference for water which on being chemically analyzed has been found to contain the most poisonous matter.

The diseases recorded as being produced by these means are

neuralgia, ague, chest inflammation, intermittent fever, typhoid fever &c. People are also rendered peculiarly subject to attacks of epidemics.

A celebrated medical professor says:—"Cholera and other diseases are propagated not only by the atmosphere when charged by fecal gases, but also by wells when contaminated by excremental percolation, the latter being by far the most dangerous mode, as the cholera ferment or poison is much more concentrated and powerful in the water we drink than in the air we inhale. Excrements even of cholera-stricken persons never spread their infectious ferment while they are fresh, but only after the second day, when alkaline fermentation sets in."

In Yokohama the materials for the production of disease may be said to be perfect, and under the circumstances it is astonishing it has escaped so well.

It will be remarked that the greatest amount of epidemic sickness occurs in spring, after the long droughts of winter, and it will also be noted that during the rainy season less of that kind of ill-health occurs. This is due to a copious rainfall, causing the subsoil water to rise, filling up the pores of the earth and preventing the passage of the obnoxious gases, &c. Dry weather having of course the opposite effect of leaving the veins clear for them. Thus, in Calcutta, the deaths by Cholera in 26 years have been during the wet seasons about 5,000, and during the dry months, as many as 19,000.

It has further been remarked with surprise that an equal, if not a greater amount of sickness occurred on the Bluff than in the settlement. That can be accounted for by the geological formation of each, the Bluff subsoil being a porous sandy gravel, while the Settlement is built on soft mud or clay, which is less porous.

The combined presence, then, of wells, cesspools and open privies are fruitful of disease and till they are abolished, the drainage scheme can make no effect upon the health of Yokohama.

Wells are in themselves innocent, so long as the subsoil is kept pure, and they cannot be done away with, until a more perfect water supply is obtained. But the drainage works offer a means to each proprietor to carry off the poisonous filth which contaminates the air he breathes and the water he drinks and which at present he leaves to ferment in his compound.

I am Sir,

Your obedient servant,

R. HENRY BRUNTON.

**REPORTS:—The American ship *Haze* reports:—Left New York on the 31st December. Pleasant voyage. Anchored 10 p.m. June 2nd, 1878, at Yokohama anchorage.
 The British barque *Winton* reports:—Left Hakodate 14th May. Had a series of heavy gales, the whole voyage, lost upper and lower fore top-sail: also carried away the lower fore-sail yard while the men were aloft on the yard. The chief officer and one sailor fell on deck. The remainder managed to catch the fore yard where they held on.
 The British steamer *Aegean* reports:—Left Hongkong on the 27th May, 1878, at 6 a.m. From Hongkong to Akuisi-Sima Island, light variable winds and fine weather. From Akuisi-Sima Island to Oo-Sima Island fresh gales from the Northward and Eastward with heavy sea, ship pitching and rolling heavily and taking heavy sea over all. From Oo-Sima Island to Yokohama fresh breezes from Northward and Eastward and fine clear weather. Arrived at Yokohama June 3rd.
 The British steamer *Belgie* reports:—Sailed from Hongkong May 28th, 1878, at 3 p.m. Experienced fine weather with light S. W. monsoons and variable winds to port. Arrived at Yokohama June 4th at 11.45 a.m.
 The German schooner *Augusta Reimers* reports:—Left Hongkong on the 20th May. Experienced, in Formosa Channel, light S. W. winds; from thence to Port calm and variable winds.**

NEW SERIES. VOL. I. No. 24.]

June 15, 1878.

[\$24 PER ANNUM.]

PROSPECTS OF THE NEW SILK CROP.

[The subject of the following article, which we translate from the *Chingai Bukka Shimpô*, is of such importance at this period of the year, and the information given in it is likely to be of so much more interest to our mercantile readers than anything we have to address to them ourselves on any other subject, that we have no hesitation in yielding to it the first place in our columns.]

RAW SILK, the principal of our products, and that which alone enables us to maintain the balance of our foreign trade, is now approaching a new season, and is being diligently grown. In fact, the earliest of the cocoons are being spun, and we may expect new silk to be brought to market within a few days from date. Silk being so important a product, and the opening of the new season being so close, we cannot leave it without notice. For, though the advance in the manufacture of silk is well known in the country, still a brief account of its present position, and the publication of our own views upon it, may in some measure be of assistance to the industry.

As our readers know, in 1876, the European crop being in an unusually poor state and the current price of raw silk being higher than it ever was before, our silk merchants, without considering the requirements of our own silk piece-goods' manufactories in the interior, or how this interest would suffer, brought into the Yokohama market even the silks of Aizu, Iwashiro, Echizen, &c., which had not hitherto been liked by foreigners, and the total amount sold was 16,740 piculs (from July 1876 to June '77) while the amount left unsold was about 1000 bales, or say 800 piculs. Whilst the export of '74, '73, '72, '71 or '70 never reached over 11,600 or 11,700 piculs. Thus the increase of export in '76-'7 was about 45 per cent, and indeed surprised people at the time. During the season 1877-78, which will end on the 30th of this month, the crop in Europe has not been so poor, and as political complications in France, and the dispute between England and Russia have greatly affected manufactures generally in Europe, in consequence but a few have invested their capital in the manufacture of silk, and the season has ended without prices here rising as high as was expected. Still, we should not be greatly in error in attributing the excess of the export of this season over that of last, to the high prices paid during 1876-77, which stimulated business, and thus increased the amount grown. The quantity sold to foreigners in Yokohama during the present season (from July 1st 1877 to date) has been 17,420 piculs, and the stock on hand unsold is 300 bales, or say 240 piculs. It may be argued that we are wrong in calling this year's growth an 'increase' having regard to the small amount left on hand unsold compared with last year's. But this is not true. The apparent excess of last season's production over this year's is not real:—because, last year, as we have stated, even such silk as was required in the interior for our native manufactures, was brought into market, and the dealers in Shinshiu

and Kôshiu brought in and sold every description of silk, no matter whether from summer or autumn eggs. Whereas, this season, it is not so:—in order to meet the requirements of the interior, where silk was so scarce last year, and also, as so large an amount of money was distributed among the people during the South-Western war, as to have increased the demand for silk goods—a large quantity of raw silk has been required there. The factories have indeed been working day and night, and yet failed to meet the demand for goods. Thus the current of the trade in raw silk has changed, and the quantity taken to meet the country demand is not small. We regret that, having no means of ascertaining the exact amount, we cannot state it here; but that it has been very great is proved by the fact that, throughout the season, the price of raw silk has always been higher at the factories in the interior than in the Yokohama market. Thus, while the country consumption has so increased,—that the quantity exported, in spite of prices not being particularly high, should have exceeded that of the previous season, shows a real increase; and there is no doubt that, had prices gone as unusually high as they did last year, an additional excess of 3 or 4 per cent would have been observed.

Now that our campaign of 1878-79 is about to commence, it is our duty to investigate and report upon the state of markets both abroad and at home; and having established correspondences in Europe and in the interior, we propose to publish the information which has reached us:

IWASHIRO (in the Fukushima *ken*) The state of the silk in this district is as follows:—

"Although at the time when the silk worms' eggs were hatched, the sprouts of the mulberry were slightly injured by frost, the damage was not serious, and all was going on well until the end of last month, when—probably on account of the unsettled state of the weather, a species of worm has been produced on the mulberry leaves, and the people are now trying their best to sweep them away. The worms, owing to the unseasonable cold, decreased, at one time, their consumption of leaf, and it is therefore to be feared that the period of commencing the cocoons will be five or six days later than was estimated.

"As regards silkworm's eggs:—since the Notification freeing the trade has been issued, some of those which were intended to be used for the production of silk, have been diverted to the cards; but, owing to the unsettled weather, inexperienced producers have greatly failed, and the average amount, it is thought, will be less this year by about 100,000 cards, than that of late years. Regarding the amount of cocoon silk; though there is at present no sign of injury to the worm, still, as the quantity of mulberry leaves they eat is small, it is thought that the weight of silk got from their cocoons will be more or less decreased when they have finished spinning.

JÔSHÛ (in the Gunba *ken*) "The condition of the silk in this district was very favourable, and the worms were going

on well until about the middle of last month, but the growth of the mulberry leaves having been bad, they are expected to rise in price. Since the end of last month, the weather having been unseasonably cold, all the silk-growers have been very uneasy; however, the art of silk-growing having now greatly advanced, the worms have been skillfully protected and no serious harm has been done. Those, however, who rear only small quantities of worms must suffer more or less."

SHINSHU :—(Nagano *ken*) We have not yet received a full report of the state of silk in this district, but we hear that the number of silkworms produced this year is apparently in excess of previous seasons—but though there may be more or less increase in those intended for cocoons, the great increase is for egg-cards. The general prospects of the crop there are good; but, consequent on variable weather, a little damage is inevitable.

From these reports it would appear that, though we cannot call the silk-crop of this year quite successful; yet it is evident that no serious injury has been incurred. If, therefore, the production of the crop be effected without further obstacle, and the market prices were to go up as they did the year before last, it would certainly not be a difficult matter for the export to rise to the figure of 20,000 piculs.

As regards the state of silk in Europe; as we stated in No. 98 of this paper, a message which reached us on the 1st inst. from our London agency states that "the weather in France has been unfavourable, and it is feared that the silk crop will suffer." No doubt, from this, both ourselves and foreign merchants in Yokohama will benefit,—in proof of which we may mention that prices here have suddenly gone up about \$30 per picul. Again, a telegram from London of the 4th inst. states that "the growth of silk in Italy is free from injury, and a good crop is expected. Great injury has been done in France, and current prices at once rose about four francs and silk growers are in great trouble."

Such is the information which we have received up to date. We shall not fail to publish further results. In conclusion, we take the opportunity of mentioning one more matter of interest to our readers concerned in the silk-trade. That the manufacture of silk has lately improved, needs no mention from us: they themselves have enjoyed the profits of the improvement. But if we compare our cocoons of the best quality with the bulk of what is now produced, we cannot say that skill and labour have been yet as fully applied as might be. At the time when our best silk, made at the Tomioka filature, was valued at twenty-three shillings in Europe, the best Italian and French was worth thirty-one. This shows an increase on an average of \$200 per picul simply from superiority of reeling. Now if we pay more attention to this, it is beyond doubt that we might increase the average value of our raw silk, \$300 per picul. And suppose the yearly crop to be 16,000 piculs, the increase in value of our export would be \$4,800,000. Is not such a result as this worth striving for?

THE article quoted above is throughout thoroughly good, and its tone healthy and sound. The facts stated by the writer, and the conclusion at which he arrives, equally support us in the advice which we have been constantly re-iterating in these columns to Japanese silk-growers:—"Improve your silk and get more dollars for it."

The writer's *résumé* of the business of 1876-77 is a good one; there is no doubt that the native manufactories were starved, growers rushing their produce down to this market to secure the high rates ruling. The 'thousand bales' which he mentions as remaining at the end of the season, all went off, however, to native looms, as soon as the first new silk of 1877-78 appeared: he need not, therefore, have regarded this in his comparison of the exports of the two seasons. His statement that production was much stimulated by the high prices of that—to growers—

very satisfactory year, is perfectly correct; but one point he has omitted to mention—perhaps leaving it to his readers' intelligence to make for themselves. Mulberry trees have been very largely planted during the past ten years, and, last year, had begun to markedly increase the supply of food. Without these, the increased hatch of eggs would have led to no result, from lack of provender for the new-born infants. These new plantations are still, we are glad to see, being persevered with, for it is not yet by any means certain that Baron Liebig was wrong in attributing the original mortality amongst the Italian and French worms to exhaustion of the old mulberry trees and consequently diminished nutritive power in the leaf: an evil against which Japan appears to be fully guarded.

Our friend of the *Chiugai Bukka Shimpō* is not altogether right, either, in stating that the price of silks has been higher in the interior than in this market. Doubtless native looms have used a considerable quantity during this season, to make up for the deficiencies of the previous year, but the large stocks brought to the Yokohama market militate against his statement. The fact is that it is only true of the Taysam descriptions he enumerates—Aidzu, &c., which the native manufacturers readily use, but which foreigners will not export—except 'à vil prix,' or in a rush like that of '76-7.

His news from the various silk districts is of great interest; but he need not delude his readers or himself with the fear that anything is wrong with the crop. We shall have 25,000 shipping bales available for export, if we want them, and as sales on the basis of \$400 for No. 3 Hanks will remunerate all parties—grower, *shōnin*, middleman &c., he need not fear that a large and profitable business will not be done, if only his countrymen will bear in mind his concluding exhortation: 'Improve your reeling.'

Fresh evidence comes to us, mail by mail, in the shape of increased consumption abroad, and especially in America, of the enhanced popularity of Japan silk, since the filature system has been in operation here. Manufacturers in the United States, long wedded to the use of Hainin re-reels, begin to find out their unsatisfactory qualities,—such as loading, &c.; and if growers here will only persevere in the good work begun, sending us down *clean* silks of good bony nerve, Japan need not fear, though her production rose to 30,000 piculs per annum. Buyers will be found to take all she can produce, if only the quality be maintained in its course of improvement.

For the coming season, growers must look for steady, legitimate business, at moderate profits. Even with peace in Europe, no gambling can be expected. A supply of 75,000 bales from Shanghai, 25,000 from Canton, 25,000 from Japan, probably 15,000 from Bengal, and fairly good crops in Europe will be ample for all manufacturers' requirements throughout the world. The trade requires a year or two of abundant, cheap, raw material, that the masses of the population may again become consumers. Then shall we see again this great trade flourishing:—growers and dealers well remunerated, merchants earning commissions, dealers, dyers, weavers, manufacturers all busy and content,—and best of all guarantees of lasting prosperity, every servant-girl with a silk dress for Sunday, and all consumers, high and low—duchess, dressmaker, and dairymaid,—pleased and satisfied, with value for their money,—an unadulterated, good, lasting article at a fair price.

THE PRESS LAW AND ITS CRITICS.

IN OUR article on the New Press Law, last Saturday, we objected to the wording of the clause which gives power to the Minister of the Home Department to increase, at his discretion, the amount of the caution-money

deposited when a journal is started. But, arguing from the amounts of the fines named, we came to the conclusion that in no case would the deposit demanded exceed 1,500 *yen*, and on that basis founded the remarks we had to make. Each of our Yokohama contemporaries, however, has read the clause otherwise, and each makes it a special article in its indictment against the Bill, that the Home Minister has virtually, under the clause, the power to crush any paper which incurs his displeasure, by indefinitely, and without reason given, increasing the demand for deposit, until the paper falls under the pressure. We have made enquiry, and find that our own view is correct: in no case will the deposit be required to exceed 1,500 *yen*; and the increase is intended to be gradual, and to depend on the increasing circulation and consequent power of the paper for good or harm. Of course, in case of offence against the law requiring the infliction of a fine, this mulct would be taken from the deposit-money, unless otherwise paid; and in such case, the deposit would have to be restored to its previous figure before the paper would be allowed to proceed with its publication.

Recognizing, as we do, the imperative necessity of keeping a check, and a strong check, upon the native press,—we cannot regard these arrangements as severe. No newspaper can be started in France without giving bonds for a far larger sum than any likely to be demanded at first as caution-money from a Japanese journal, and the full amount that can be asked is only £300. But we quite agree with the *Japan Gazette* in recommending the Minister to consider whether the French system of giving security would not answer the purpose sought, as well as the actual locking-up of so much capital in deposit in a Bank.

Indeed the system of security by bail-bonds appears to us to offer an advantage to the Government over the mere deposit of money, inasmuch as it necessarily interests the guarantors of the new journal in its proper conduct. Three or four such god-fathers of a new-born paper, respectable house-holders, each liable for an amount increaseable up to a fixed sum as the paper grows in standing and influence, and together ultimately responsible for 1,500 *yen*, would certainly exercise a private consorship over an editor by no means ineffective, and far more restrictive to his pen than the prospect of a mere fine.

The translation which we have procured of the draft of the Law published by the *Akebono Shimibun* differs in other points from that printed by the *Japan Herald*, and copied by the *Japan Mail*, and on which the writers of articles in both papers founded their adverse criticisms. And we have to correct an error into which we fell ourselves, in common with our English contemporaries. The draft is under consideration of the *Daijō-Kuwan*, not of the *Genrō-In*. But, on the whole, we think it best to wait the publication of the revised draft, when it shall actually have become law, rather than publish, now, an amended translation of the edition put before the public already; and to that moment we defer, also, further criticism of the details of the law.

But we may bring a perhaps useful addition to the materials for discussion—when the time comes for it,—by rehearsing the points of an Act which was passed three months ago by the Governor-General in Council for the regulation of the Vernacular Press of India. Naturally, our native contemporaries know nothing of this, and it is chiefly for their use and instruction, therefore, that we mention it—to show them how even a constitutional Government, like that of England, finds itself occasionally compelled by circumstances to exercise the severest supervision over the Press. And it would be as well that our own countrymen here should make themselves acquainted with the provisions of this Vernacular Press Act, before blaming the Japanese Government,—which has only just succeeded in repressing a rebellion which threatened its

very existence; has just lost one of its most prominent members by the hands of assassins; and is harassed daily by reports of riot and disturbance in many parts of the country—for imposing a legitimate restraint upon an engine of which the engineers do not know the force, and which is far more easily used to harmful purpose,—to excite, irritate and delude an ignorant or half-educated populace;—than to good, to guide and instruct them to their real benefit.

To Englishmen unacquainted with India, one of the worst features of the measure is its apparent precipitancy. The Bill was introduced into Council, discussed, settled, passed; received, by telegraph, the approval of the Secretary of State,—and became law—all in one day, the 14th of March. Such haste in England would be called 'indecent' and, according to English law, nothing but a strained exercise of the Royal Prerogative, justifiable only by the most pressing danger, could do such a thing. And the Sovereign's advisers, meanwhile, would lie under risk of impeachment, and would be bound, at the earliest possible moment, to get an Act of Indemnity, passed by Parliament to purge them of what is, technically, a grave offence against constitutional law. But the Governor-General of India and his Council have entrusted to them—and very wisely—a larger power, subject only to the approval of the Secretary of State for India, and subject also, of course, to appeal to Parliament, which occasionally sees fit to reverse the decisions arrived at in Calcutta. The apparent haste and want of deliberation, with which measures are passed here, and the sudden publication of edicts when determined on, have often been the theme of rebuke or unfavourable comment by foreign journalists in Japan; but we are strongly inclined to believe that much the same motives operate here as in India for such apparently undue precipitancy; we are as fully willing to make allowance for the difficulties of the rulers, and appreciate as clearly the dangers attendant on the discussion of proposed measures by an excitable people. And the parallel may be pursued further. If Englishmen defend and approve restriction of the Vernacular Press in India;—and those who do not are in a small minority—surely we have no right to object to it here. There,—where the English Press is by no means treated with the same respect, and is far from having the same power, as at home, the chief cause that excites opposition to the fettering of the Native Press, is the fear lest the measure should be hereafter construed into a precedent for imposing some measure of restraint upon English journalists. Here, no such fear can exist, and—the matter lying entirely between the Japanese Government and the Japanese people,—foreigners have really no interest in the question, beyond the limits of absolutely abstract principles. That which we select as our guide in this, as in many other discussions, is the consideration whether the measure is calculated to strengthen, or weaken, the position of the Government. The greatest evil that could happen to Japan is a counter-revolution—a successful attack, by any class or section of its loosely united people, upon the existing central government. And nowhere would the effects of such disaster be more immediately felt than in our own foreign trade. Clearly, therefore, the first thing to be considered by foreigners is how any measure proposed is likely to affect the position of the government. 'Liberty of the Press' 'free thought, free speech, the birthrights of the people' &c. &c. are mere phrases, catch-words; and we see, as now in India—as not long ago in Ireland, when 'free speech' threatens danger to the Empire, Englishmen—journalist and statesmen alike—muffle up the 'palladium' in a cloak of 'necessity' and put it under lock and key, to keep it safe until quieter times. And what is England's occasional emergency, is at present Japan's constant condition.

Turning now to the conditions of the Indian Act, we think it will be found that the new Japanese Press Law compares with it even favourably in point of lenity. The Indian Government is empowered by this Act, not only to control the Vernacular Press of India Proper, but to seize, or prohibit the importation of journals published beyond our own borders. Bonds and securities may be required of printers and publishers by district officers, with the sanction of the several local Governments, and any such local Government may publish in its official *Gazette* a warning to any offending paper, disregard of which will be at once followed—on repetition of the offence—by confiscation of the security bonds, and also of all the plant and property of the offending journal. The necessity, however, of giving security-bonds may be avoided by submitting 'proofs' of all matter intended for publication to a governmentally appointed censor; but the publication of any matter not in such 'proofs' is punishable by fine and imprisonment.

The Act, of course, is a temporary one, and will only take effect in such districts as the Governor-General may specially indicate, and will operate for only such period as he may determine; and—as a matter of fact, the Act at present is not put in force, but is kept suspended over the heads of the native Indian journals in *terrorem*. But should any one of them venture on printing such an article, for instance, as that which, we quoted last month from the *Choya Shinbun*:—"England's Distress India's Opportunity," the Sword of Damocles would immediately fall.

We have referred to this matter with a double purpose. We wish to show Japanese journalists that they are not particularly or unprecedentedly ill-treated by their Government; and to remind our English colleagues that, before they attack the Japanese Government for imposing restraints upon so dangerous a machine as the printing-press, and so proudly vaunt our own freedom—they must look carefully in all the corners of that 'Empire on which the sun never sets' to be sure that similar 'tyranny' is not being exercised somewhere on our own fellow-subjects by our own enlightened, constitutional, parliamentary Government. It would be humiliating were any of the Japanese papers,—in reply to a diatribe against the Japanese Home Office for imposing such a law as this upon the Press,—to retort with such a '*tu quoque*' as we furnish them with to-day.

A NEW LEAF OF SCIENCE.

[Under the above title, a valued correspondent in London sends us the following contribution to our columns. It has, of course, no local interest, but we venture to think that it possesses interest of a wider and more general type. His argument that the mind has such influence over the body as actually to compel the appearance of the symptoms of such a frightful disease as that called *hydrophobia* appears perfectly sound. There are many other forms of *monomania* which have always been similarly accounted for. We do not recollect whether the disease has ever been noticed among the Japanese, whose dogs are of a particularly morose and savage type. It is odd that the only case which recurs to our memory of the symptoms of *rabies*, occurring in consequence of the bite of a dog in Yokohama, makes dead against our correspondent's theory: and we must fall back upon the suggestion at the end of his article for an explanation in this instance. We refer to the case of a child of five years old, which was bitten by a dog and died, after exhibiting all the symptom of '*hydrophobia*' in a severe form. These could not, from the tender years of the subject and consequent inability to read or reason, have been produced by effect of recollection, comparison, analogical deduction, or other mental process: and nothing but actual blood-poisoning could account for the fatal termination of the case. Unfortunately the surgeon who attended the child is dead and no professional record of the case is in existence, but the present writer was here at the

time and conversed with the surgeon frequently on the subject. It was a markedly severe case. We should be glad of information from any of our numerous medical readers here and in Tōkiō. Have any cases of '*hydrophobia*' come under their notice in their practice here:—is the disease known to the Japanese? We should be glad to transmit to our London friend any facts in corroboration of, or opposed to his theory, which can be gathered here.]

THE development of Science is most effectually opposed by professional interest. That interest may be political, legal, theologic and even medical. When the uprising science happens to coincide with any powerful interest then it rises like a rocket, and does not "come down like the stick;" but the behaviour of the medical world, observed in relation to a discovery at the Glasgow Infirmary reported in the *British Medical Journal* by Professor Macleod, presents a useful study for outside thinkers. The phenomena of what is called "*hydrophobia*" form the special object of the Glasgow physician's examination, but the facts which he freshly relates form but a small, though very important part, of a new scientific generalization. The report of Professor Macleod's discovery was introduced to the general public by the *Daily Telegraph* of December 26th 1876 and is quoted there from the *British Medical Journal*:—

"It was remarkable he" (Professor Macleod) said "that all of a sudden a disease should have arisen in Glasgow which none of the members of the medical profession there had ever seen before. The first patient, in the Western Infirmary, had told him that he was perfectly well, until one day he took up a newspaper and read of a man that had died of *hydrophobia*, and he was never of any use from that moment. The second told him exactly the same thing, and Sergeant Mc'Gilvray informed him that his mind was haunted night and day by a bite he had received, knowing, as he did, that people had died from '*hydrophobia*,'—till, at last, he had those extraordinary symptoms, which seemed really as much mental as bodily. There was a lot of nonsense talked about *hydrophobia* and they need not be afraid of it. Hundreds of people had been bitten in Glasgow during the last few months and there had been only three, if these were as he thought they were, cases of *hydrophobia*." A few days after this appeared in the *Telegraph*, the subject was resumed in the *Morning Post*, under the *nom de plume* of "Litterateur" and was continued by the same writer in the *Globe*. The day after the letter in the *Morning Post* (January 1, 1877), Mr. G. Berkeley, a well known follower of the hounds and well experienced in canine matters, wrote to the *Times*, stating his belief and that of "several of his medical friends" that the so-called disease was in many cases a mental production. In the same journal, confirming the Glasgow experience, the case of a gentleman was reported who was seized after a dogbite with this *hydrophobia* insanity, and whose flesh, when exposed, had not been touched by the dog's tooth. Popular belief formerly assigned *hydrophobia* to the hot or "dog-days." But lately it has been shown that the malady, like some forms of *hysteria*, is independent of heat. Throughout Australia and New Zealand, in all varieties of climate, there is no such thing as dog-venom and no *hydrophobia*. So in Brazil and other hot countries. Since the remarkable experiments of M. Pasteur and Dr. Tyndall, which extirpate the notion of spontaneous generation at all—the mention of spontaneous generation of poisonous venom in the saliva of a dog, where it is not natural, as in serpents and hornets, becomes an insult to a clear intelligence. If this effect of a powerful mental impression was only a solitary example of the formative qualities of mental force, it would be remarkable enough; but so many instances of this kind of operative energy are continually reported (as quoted in the *Morning Post* and *Globe* articles) producing not only disease, but death; that the new Leaf of Science which this Glas-

gow discovery opens, as respects the nature of the only known energy, Mind, demands most serious and profound study. The correspondence in the *Globe* is well worth careful study, especially the letters of T. M. O. (August 20th September 1st, 1877). Writing of a lunatic Asylum Ball, he says "Had 'Litterateur' been there, he would have found a practical application of his theory of the influence of mind upon disease. No. 25 fed on impressions, on imagination, and she poisoned herself with an impalpable and unsubstantial idea, 'jealousy' until ultimately she will become a raving lunatic, and death alone will put an end to the wreck produced by a fiction."

The French Medical School, the same writer points out, is quite aware of the force of mental impressions in producing *hydrophobia*. M. Vidal, indeed, says that the very name of the malady "ought not to uttered before one who 'has been bitten by a dog.'"

But the English Medical School, as represented by Sir James Watson in the *XIXth Century*, differs both from the French and Scotch.

In his late article, Sir James adheres to the old notions, says nothing at all of Professor Macleod's experience or of the correspondence in the *Morning Post*, *Times*, and *Globe*, and, while acknowledging the non-existence of the malady in Australia and elsewhere, is unable to add a line of explanation or suggestion.

There is a school of thinkers who, if they could, would evidently expel so inconvenient an entity as Mind from the universe. There is little enough of it in their own productions. The daily increasing records of its formative energy would, if only acknowledged, spoil a large amount of profitable business. That may be one reason why the English medical faculty are averse to the extension of this, to others, useful science. We have not space for the many curious facts which the late correspondence has reported, but we must make room for one which appears in the *Globe* of September 5th, 1877. "Dr. Babington used to tell a very amusing story of one of his successes. He had a patient who could not sleep, and on whom all his narcotics at last had no power. She said to him, 'Could you not mesmerize me?' 'I never tried to mesmerize; but if you wish it, I will.' He did try and succeeded. 'One day he said to her 'I must go to Leeds to-morrow, and I am sorry that I shall not be able to send you to sleep as usual. The only possible way would be to make the passes at Leeds about the usual time, three o'clock.' She consented to this arrangement. As he was returning from Leeds, he was lamenting among some medical companions that he had forgotten to make the passes. The next day, as soon as the lady-patient saw her physician, she said 'I was so much obliged to you yesterday. I went off quite nicely, at the very time you made the passes.'"

At the last general meeting of the members and friends of the Home for Lost and Starving dogs held in the rooms of the Society for the Prevention of Cruelty to Animals, in Jermyn St., London, the Manager Mr. Scoborio stated that since 1867, there had been 90,000 animals brought to them by the police and not a single case of *rabies* had occurred. Many suspected dogs had been kept alive, and apart from their fellows, upon prepared food, but the result had always shown them to be free from that virulent disease. The manager had been bitten many times, but never experienced a symptom of what is called *hydrophobia*. In the last two members of the Quarterly *Journal of Mental Science*, W. Lanter Lindsay, M. D. of Perth, writes on 'Spurious Hydrophobia.' A case had occurred at Perth Infirmary, similar to those at Glasgow reported by Professor Macleod. A man had been bitten by a dog, which was never accused of madness, "nevertheless the affair so pressed on the man's mind, that he appeared to be in a maniacal state, but be-

came quiet after his removal to the Infirmary." He also quotes the case of another patient (mentioned in the *Scotman* of October 25th, 1879) "who died at Glasgow of *hydrophobia*. The first indications of the disease appeared after reading an account of a death by *hydrophobia*. To the psychologist, says Dr. Lindsay: "*hydrophobia* is invested with the highest interest, both of a scientific and practical kind, because it furnishes one of the best examples of the wonderful influence of mind over the body and of morbid mental conditions in the generation of fatal physical disease." I believe he says that the majority of the cases of *hydrophobia* are the direct fruits of morbid dread. After reading the report of Mr. Scoborio as to the 90,000 dogs and noting the fact of the non-appearance of any kind of disease in bodies dead from *hydrophobia*, the spontaneous generation of canine poison appears most like a medical myth. It is of course probable that cases of real *rabies* may have been produced in this manner. A dog biting furiously at a bone of putrid meat may have lacerated its mouth and so have inoculated itself with that venom; have bitten other dogs and persons while its saliva was thus poisoned, and so have produced the little real *hydrophobia* which has again produced the newspaper form, resulting wholly from powerful mental types. This is matter for very serious study also, as to the power of mental impressions not only in producing forms of disease, but in increasing and maintaining those produced naturally.

THE TREATY AND THE CONGRESS.

[The following review of Prince Gortschakoff's reply to Lord Salisbury's despatch, which we quote from *Vanity Fair*, at once saves us the labour of analysing it ourselves, and gives to our readers a far more valuable article than we could hope to write.]

THE reply to Lord Salisbury's despatch which Prince Gortschakoff has been so good as to write is a document at once impudent and contemptuous—impudent because it denies the truth of certain statements made by Lord Salisbury which are yet absolutely exact, contemptuous because it dismisses all his arguments without answering them. The comments on his assertions need be but short to be sufficient as a demonstration of this.

"It is not exact to say that the Treaty of San Stefano has created a new Bulgaria. Bulgaria existed, although in a state of oppression." Lord Salisbury nowhere says that the Treaty creates a new Bulgaria. He says it "erects" a new Bulgaria, and "creates a strong Slav State." But Prince Gortschakoff's counter-assertion that "Bulgaria existed" is one absolutely without any foundation known to history. There are Bulgarians, as there are Zingaris in Turkey and Gladstonians in England; but there has never been any more a Bulgaria than there is a Zingaria or a Gladstonia, and it is absolutely correct to say, as Lord Salisbury does, that by the Treaty a Bulgaria is first "erected"—for which we should read "invented"—and a strong State, which will be, not Bulgarian, but Slav, created.

"The Treaty of San Stefano has not placed the new State under the control of Russia."

But the Treaty provides (Art. VII.) that the whole "organisation of the future administration" shall be "elaborated before the election of the Prince" by "an assembly of notables, under the surveillance of an Imperial Russian Commissioner, and in presence of an Ottoman Commissioner," at a time when, by Article XXVI, the Porte has given up all authority in the country and when the Russian Commissioner is supported by an army of occupation. It further provides that the "introduction and superintendence" of this "organisation" shall be committed to a "Russian Imperial Commissioner" for two years, and that he shall have the right of enforcing his views of it by using troops for that purpose. Russia will have made the Constitution through the notables, who cannot but do the bidding of her Commissioner; she will have worked it for two years; and will have left it in charge of a Prince elected under the pres-

sure of her army. If this does not place Bulgaria under the control of Russia, nothing will.

The Imperial Russian Commissioner has only a right of superintendence in concert with an Ottoman Commissioner.

This is an assertion that takes one's breath away. There is not a word of "concert" in the article of the Treaty referring to this subject. The words are, "Sous la surveillance d'un Commissaire Impérial Russe et en présence d'un Commissaire Ottomane." What the "presence" will be worth of a solitary Turk in front of a Russian Commissioner backed by 50,000 men, may be imagined; but the point is that nothing in the world is said in the Treaty to show—as Prince Gortschakoff would now have us believe—that any "concert" or anything else than "presence" is required from the Turk.

"The Treaty in no wise places Bulgaria under the domination of a chief chosen by Russia. The governor will be elected from the administrative councils, with the confirmation of the Porte and the assent of Europe."

The Treaty provides that the Prince shall be "freely elected by the population" (there is not a word in it of election by "conseils administratifs") while the Russian troops are in occupation of the whole country, and able to dictate any election Russia pleases. As to the "confirmation by the Porte," the Treaty provides that the Prince, once so elected, shall be ("sera") "confirmed by the Porte with the assent of the Powers." It is clear that no Prince can be elected who is not suggested by, or at least agreeable to, Russia, that the Porte must confirm the election, whatever it may be—and that the Powers may assent if they please.

"The clause concerning the protection of members of the Russian Church must be much misunderstood in order to be compared with that of the treaty of Kainardji. The clause of the Treaty of Kainardji might embrace all the Christian subjects of the Sultan professing the orthodox Greek rite. The Treaty of San Stefano mentions exclusively monks, ecclesiastics, and pilgrims being Russian or of Russian origin."

True, but the claim in the Treaty of Kainardji never had or was admitted to have the force ascribed to it by Russia, whereas this clause absolutely gives "the right of official protection" to all Russian Ambassadors and Consuls in behalf of any human beings they may accept as Russian subjects, the manufacture of which has always been the method by which Russian consuls have made their livelihood.

"The affirmation that the whole of the stipulations, concerning the retrocession of Bessarabia, the extension of Bulgaria to the Black Sea, and the acquisition of Batoum, would render the will of Russia predominant in the Black Sea, is exaggerated."

That is a matter of opinion, and we prefer Lord Salisbury's to Prince Gortschakoff's. We do know that on the Caspian, where her positions are less important than they would be in the Euxine under this clause, the will of Russia is so predominant that she absolutely forbids the Shah of Persia to fly his own flag, even on a yacht, in his own waters.

"As to the acquisitions in Armenia they have but a defensive value. It is possible that England would prefer to see these strong positions in the hands of the Turks; but for the same reason Russia attaches value to their possession, in order not to have to besiege them at each war."

So Russia looks to future wars; so she has made this Treaty, not to secure peace, but to be put in a good position for further warfare! A more cynical betrayal of the purpose of the Treaty could not be made, and this, if it stood alone, would be sufficient to justify the resistance to its imposition on Turkey and Europe.

"The reproaches addressed to the Treaty concerning the indemnity are no better founded. It would have been simpler to see (in the Treaty) a design to spare Turkey as well as the interests of Europe."

This is delightful! An indemnity of two hundred millions is to be taken as evidence of a desire to spare ("ménager") Turkey! And the proof of this desire is that forty-four of the two hundred millions are left over for future arrangements, as to which the only certainty is that Turkey cannot pay them in money, and must therefore pay in some other way. Surely such a piece of cynical impudence never was penned.

These are some of the points of this reply. It amounts in effect to this:—"We mean to maintain the San Stefano Treaty as a whole. Some of the absolutely unimportant details—as, for instance, the boundaries of Bulgaria and the length of our occupation, you may discuss, if you please; but as to the rest, we mean to have it all, and your remarks

upon it are partly foolish; partly inaccurate, and altogether beside the mark."

Such is the reply which by some has been thought to be conciliatory.

DOES THE CONDUCT OF RUSSIA WITH REFERENCE TO THE TREATY OF SAN STEFANO JUSTIFY THE CALLING OUT OF THE RESERVES?

Lord Beaconsfield, Lord Salisbury, Lord Houghton, Lord Cairns, Sir S. Northcote, Mr. Hardy, Sir H. D. Wolff, Mr. Hanbury, Sir G. Bowyer, and Mr. Baillie Cochrane, say "Yes," because—

1. "The keynote of the policy, the 'diapason of the diplomacy' of the Government is the maintenance of public law in Europe as opposed to brute force.
2. The San Stefano Treaty between Russia and Turkey, and the Treaty of Paris, to which Russia and England are parties, cannot stand together, and Russia denies our right to discuss the former.
3. The San Stefano Treaty puts an end to Turkey in Europe; it makes the Black Sea a Russian lake; it creates a New Bulgaria, which will be a Russian dependency, and reach from the Black Sea to the Aegean; and it gives Russia Bessarabia and the control of the Danube.
4. The Government is still anxious to go into Congress; but it must be a real Congress, and not, as Russia would have it, a sham one.
5. Lord Salisbury's despatch has done more to preserve the peace of Europe than anything that has happened in the last two years.
6. The terms of peace stated in July last were to be submitted to a European Conference.
7. British interests were defined solely with a view to the conditions of England's neutrality during the war.
8. Calling out the Reserves is simply a precautionary measure; the regiments cannot conveniently be put into a state of efficiency in any other way.

Lord Granville, Lord Derby, Lord Carnarvon, the Duke of Argyll, Lord Selborne, Mr. Gladstone, Sir W. Lawson, Mr. Jenkins, Mr. Chamberlain, Mr. Jacob Bright, Mr. Richard, Sir C. Dilke, Mr. Courtney, Mr. Dillwyn, and Lord Hartington, say "No," because—

1. "It is no part of the business of this country to undertake without allies the defence of the interests of other nations or of the freedom of Europe."
2. The conduct of the Government has been one of "petty, paltry, pitiful provocation, and unworthy of the nation;" for the sake of a phrase it is fomenting a war that may deluge Europe in blood.
3. The worse the Treaty of San Stefano is, the more need is there of a Congress; there is no other way of setting it right.
4. The Government might have taken further steps to come to an agreement with Russia, either with or without a Congress.
5. Lord Salisbury's despatch mis-states the effect of the Treaty; it brings charges against Russia which are unfounded; it has dangerously excited the country against Russia, and has mainly created the present difficulty.
6. The Government were informed of the Russian terms of peace in July last; they made no protest then, and it is not consistent in them to do so now.
7. Nothing in the treaty touches British interests as defined by the Government when the war broke out.
8. If the present is an "emergency" justifying the calling out of the Reserves, we shall have them called out every three or four years.

EDITORIAL NOTES.

THE following Notification, extending the period for the exchange of the old *Daijokuwan* and *Mimbushô*

paper money of small denominations, was issued on the 7th instant:—

NOTIFICATION BY THE OKURASHO,
(FINANCE DEPARTMENT.)

No. 26B. 7th day, 6th month, 11th year of
Meiji (7th June, 1878.)

To *Fu* and *Ken*.

It is hereby notified that:—although notice was given by No. 19B. on the 4th of last month, that the paper money of and under the value of one *yen*, which was issued by the *Daijokwan* and *Mimbusho*, should be exchanged before the 30th day of the 6th month of this year:—As it would be inconvenient if such exchange could not be effected in distant provinces; the period of exchange has been extended until the 30th day of the 9th month; and it should be therefore notified to people under your control that after this period has expired, applications for exchange will not, under any circumstances, be entertained.

NOTE.—The period of circulation of this money will end on the 30th day of the 6th month.

(Signed.) OKUMA SHIGENOBU,
(Minister for Financial Affairs.)

THAT the experiment now being made here in the manufacture of Black Tea is being well watched both in England and America is evident. The *Produce Markets Review* has the following:—

"Some Japanese Congous were sent to this country for the first time last year, and the small experimental consignment, which was understood to be made by the Government of Japan, gave good promise for the future. This gives interest to the following, on the subject of alterations in the preparation of Japan Teas, so as to make them more suitable for the English market, which is taken from the *American Grocer*:—

"For some two or three years the question of making Oolongs and Congous out of the Japanese leaf has occupied the minds of the English and American houses in Japan. Some time ago the Japanese Government took the matter into consideration; in fact, imported a few Chinamen from the Black Tea districts of China to assist them in their experiments. The cause of the attempt to make Black Tea is, that Japan Tea, as cured now, is used almost exclusively in this country—England, the greatest Tea-drinking country, only taking a very small quantity. The Japanese Tea growers, having laid out so many Tea gardens, as the bushes increase in size, the crop is now larger than we can consume; the consequence is, the price has gone down so low that it does not pay the growers. Our consumption is about 20,000,000 lbs. of Japan Tea; England consumes 130,000,000 lbs. of Congous, none of which, as yet, has been obtained from Japan. The Japanese Government and the merchants are anxious to get some of this business. The experiments that have been made heretofore have been made upon the leaf after it has been 'basket-fired' by the Japanese, and have resulted in failure. In order to change the character of the Tea a change in the process must be made the moment the leaf is picked from the bush.

"The only difference between Japan Teas and Oolongs and Congous is in the different mode of curing. Japan Teas, like Green Teas, are not allowed to ferment. Oolongs are fermented to a certain extent; Congous are fermented to a much greater extent. The effect of the fermentation on the Tea is to make it richer and smoother. Tea in one respect is like tobacco: if you should take the tobacco leaf when first cut, and dry over a fire, it would be so sharp and bitter that it would bite the tongue so that no one could use it. In a letter dated Hiogo, May 20, we have the following information touching this subject:—

"Japan Oolongs.—An English firm here have received orders from some American house to attempt this, and they have imported fifty Chinese from one of the Tea districts, and are now working in the interior. It is generally believed that they are working under an expense of 3,000 dollars per month, besides native labour. Everything is kept very quiet, and it is only by chance one can get any information of their movements."

"In another letter of same date the movement is attributed to the Japanese Government. But no matter whether it is private enterprise or the act of the Government, the time is not far distant when we will have Oolongs and Congous from Japan in large quantities."

Of course all this is 'old news,' but we wish to let our Japanese friends know that they will certainly find a market if they can only make the Tea. But what we have especially to fear is that they will not be content to make the experiment this season on a scale sufficiently small, but will at once, without properly trying the London Market, and misled by reports on a few small specially prepared samples, commit themselves to the manufacture of large quantities of what we sadly fear will prove to be an article of small original strength and very little keeping

quality. We must all buy our experience—that which we get for nothing we never put any value on—but there is no reason why we should invest too large an amount at once in the purchase.

THAT the world is getting wiser as it gets older, the universal resistance which is now being made everywhere to the denudation of a country of its forests would seem to prove. Read in connection with what we have recently written, and the effort made by this government to check and remedy the evils of disafforestation, the following report from Italy will be read with interest. We take it from the *Echo*.

"A remarkable illustration is added to the list of climatic changes brought about by the process of deforestation by what is now taking place at Rome, where the topic has excited an angry controversy. All authorities agree that the felling of the woods has not only altered the influences of the climate in Greece, but also diminished the fertility of the soil: a similar result has operated in the once abounding provinces on the coasts of the Dead Sea; and the same fact was remarked, under both its aspects, by those who had in charge the magnificent Euphrates Survey. It is even the belief of many that like causes have produced like effects in some districts of England; while in France the theory finds universal acceptance. In the Roman instance, to the want of wood is attributed, in a large proportion, the proverbial unhealthiness of the City; and so important is the subject considered, that protests in connection with it have been made in the Roman Parliament, one member of which undertook to demonstrate, a short time ago, that the disappearance of trees was almost invariably followed by the appearance of fever. The tree, he said, is the great enemy of fever, though something may be allowed, perhaps, for rhetoric, when he insists that, for every one cut down, a man or possibly many men, would die. Certainly, however, he cited two conspicuous examples in which, when the woods of Italy had been hewn away, territories previously salubrious became hotbeds of malaria. At present it is proposed to destroy an extensive and beautiful grove, of two centuries' growth, on the banks of the Tiber; and a sort of local panic has been created, as on all hands it is declared that this must be most prejudicial to the health of the inhabitants. Whether or not the danger be so serious as is imagined can scarcely, of course, be determined; but the question is an interesting one, and it might be worth the while of practical philosophers to investigate it a little further. Among the characteristics of all improvident nations, the wholesale destruction of forests has generally been remarkable; yet the circumstance is probably due to ignorance rather than to recklessness, though it is an ignorance much to be deplored, since Europe is not the New World, that it can afford unlimited clearings."

And even in America,—at all events in the Pacific States,—the people are waking up to the dangers they are incurring by the reckless destruction of their natural woods,—without any provision for replanting,—which has been going on so long. One of the San Francisco papers had, lately, we noticed, a very earnest article on the subject, attributing to this cause much of the deterioration of climate lately noticed, and urging immediate legislation to stop the growing ill.

THE *Hochi Shimbun* takes occasion, under cover of an expression of gratitude for the new Law constituting Provincial Assemblies, to expose and attack an evil which has doubtless existed hitherto and which probably this new arrangement for partial self-government of the provinces will go far to remedy. The writer points out the evil, effect of too much 'zeal' exhibited by provincial governors and other officials, who—guessing at, or imperfectly understanding, the intentions and wishes of the Central Government,—have not infrequently annoyed and distressed the people by either exceeding their instructions, or—in some instances, acting on mere supposition and conjecture, without any instructions at all. It is very likely that these evils have been rampant, and the instance given by the *Hochi Shimbun* of unnecessarily costly school-buildings having been erected in poor villages has been verified by frequent observations of foreign travellers in the interior. The people are now, by the new Law constituting pro-

vincial and municipal assemblies, endowed with a very considerable power of check upon such extravagance, and it is to be hoped that, by wise selection of members of these synods, and by the moderation and self-restraint of the members themselves in Council, the people will show themselves worthy of the confidence reposed in them, and their fitness to admission to a still larger share in the government of the nation. One most important point will, we hope, be conceded in the bye-laws. It is much to be regretted that it was not mentioned in the original regulations. We refer to the reporting of the debates by the newspapers. It is true that it is provided that,—except on extraordinary emergency, the sittings are to be held in public; but we know that, in Japan, this is not held to necessarily include permission to the newspapers to report proceedings. As, however, this concession was made in the case of the session of the *Chihokusan Kuwaigi* this year in Tôkiô we may hope that the same liberty will be accorded to the provincial press. The Press is the best educator of the people, and the best check on any such abuse of authority as that complained of by the *Hochi Shimbun*.

A LETTER appeared in the last number of this Review criticising the management of the Mitsu Bishi Company. This is decidedly the most important private business enterprise yet started in this country, and—considering that foreign trade interests are largely affected by its good or bad management, it is only natural that the proceedings of its Directorate should be very jealously watched, and such reports of its progress as may be made from time to time, submitted to searching cross-examination. This journal has, we can say with confidence in any reasonable man's belief, consistently pursued the course marked out for it in its earliest manifestoes:—it has given a liberal, unbought, independent support to the Government; has devoted a large amount of labour to the consideration and discussion of commercial subjects, interesting alike to natives and foreigners engaged in the Japan trade. We have never sought to conceal the fact that the interests of foreign traders are fully as much kept in our view as those of the natives of Japan when writing on such subjects: believing, as we do, that all are inextricably mixed, and that all parties are equally interested in the country's prosperity. Iwasaki, the man put forward as the representative member, if not the actual controller, of the Directorate of the Mitsu Bishi Company, the man who, in an English witness-box, stated on oath that he was the sole and only owner of the whole fleet,—lately put forth a document purporting to be a Report on the condition of the property under his charge, and bewailed enormous losses, in spite of his receipt of a large subsidy, and of earnings, during the South-western Rebellion, by the employment of his ships as troopships, which must have amounted to a very large sum. This extraordinary statement was quite incredible, and was justly treated as unworthy of belief by all the foreign journals both of Japan and China, which reviewed his Report. The only points on which foreign critics differed were these:—was Iwasaki's motive in making such a statement prefatory to an enhancement of rates of freight and passage-money, or did he hope to screw an enhanced subsidy out of the people; or—was it possible that even the enormous receipts of the line could have been muddled away in mismanagement and peculation? A correspondent, writing under the pseudonym of 'Nauticus,' has commenced, in this Review, a thoroughly exhaustive examination of the history and affairs of the Company, a quite legitimate and most useful work; and we have no doubt that, when he has finished his task, it will be acknowledged that he has deserved the thanks of both foreigners and natives, of private merchants whose pecuniary interests suffer, and of officials whose reputation is endangered by the mal-administration of the Company's affairs. It is quite natural that some one should be put up to make out a defence; and we are sorry to say that here it is equally natural that the line of defence adopted should be personal abuse. A letter is addressed to another paper, signed, of course, 'Fair Play' (Oh, fair play! what rogueries are committed in thy name!!) in which no attempt is made to refute 'Nauticus' facts or figures, but the endeavour is made to discredit him by insinuating that he is a discharged

officer of the Company, or one still in their employ, guilty of a breach of trust.

The etiquette of the press appears to be non-existent in Yokohama. Were a letter to be addressed to this Review, in reply to another which had appeared in the columns of a contemporary, it would be returned to the writer, with the recommendation to send it to its proper address, that of the journal in which the controversy had originated. This is the practice in every country where press etiquette is properly understood. Such, however, is apparently, not at present the practice in Yokohama. If remains, therefore, only for us to say that, beyond giving a flat denial to the statements of 'Fair Play' respecting the personality and status of our correspondent 'Nauticus,' neither that gentlemen nor ourselves can take any notice of this letter. We impeach Iwasaki and his confederates, native and foreign, of gross mis-management of a promising and most important national enterprise, if not of more flagrant offences, and we intend to persevere in the exposure which has been commenced of their proceedings, in the hope of moving the Japanese Government to withdraw their support from them, and to give it to more capable and more reliable men, fitter to be trusted with such important interests. Our columns are open to any attempt to refute our arguments, to challenge our statements, to invalidate our deductions—but it must not be expected that any further notice will be taken of any communication on the subject made to our contemporaries. If one of them will undertake the defence of the Mitsubishi Company in its leading columns,—that is another matter: it will then be open to us to reply: but letters in criticism of our own articles or of 'Nauticus' letters must be addressed to this journal, if notice of them be desired. If addressed to any other, the public will understand, as well as we shall, that the writer shrinks from the combat '*en champ clos*' and he must not be surprised if he is treated with the contempt he will deserve.

PAPERS OF THE GERMAN ASIATIC SOCIETY.

ON CREMATION OF THE DEAD IN JAPAN, By Professor DR. W. DOENITZ.

(Translation specially for the 'Japan Times'.)

CREMATION of the dead, which is so much discussed at present in Europe, is a custom which has been practised for more than a thousand years in Japan, and which, after having been prohibited for a time, has now for about four years been carried on eagerly. It is not however an original Japanese contrivance, nor does it seem to be connected in its origin with any known religious doctrine.

The first historical traces of cremation of the dead reach back to the end of the seventh century of the Christian era (about 698), that is, with tolerable accuracy, a century after the introduction of Buddhism into Japan. At that time, during the reigns of the Emperor *Mombu* (*Mon-mu*) a celebrated priest named *Dôsho* died at the age of 72, after having directed on his death-bed that his corpse should be burned. His disciples brought the body of the deceased to Kurihara and carried out the desire of their master. As they were about to collect the ashes, and divide them amongst themselves, a violent blast of wind swept away the last earthly remains of their teacher, and frustrated their intention.

Just at this time, the Imperial palace in Miako was built, and in connection with this, the disciples applied to the Government to erect a temple in memory of their much honoured teacher in the flourishing capital. To this day there is a temple in Kioto named *Zen-In* which is dedicated to the memory of this priest, who is said to have been the first in Japan whose body was solemnly burnt.

This destruction of the corpse by fire, called *Kuasô*, seems to have very soon found sympathy in the highest circles, because it is said that only four years later, the Empress *Jito*, who had abdicated in 696, was given over to the fire after her death. Thenceforth it began to be generally employed, without however completely supplanting *Dôsô* or interment.

As a peculiar phenomenon, it is worthy of note that a Buddhist sect took up the matter, and made cremation a

duty of all its followers. This is the *Ikko shin*, lately called the *Ikko shin shiu*, generally called by the people *Monto*, which was founded at the beginning of the 13th century by the Priest Shinran. As nothing is more remote from Buddhism than the burning of the dead, this shows very distinctly the peculiar manner in which this religion developed itself in Japan.

For almost twelve hundred years this custom was maintained. It was, no doubt, all the more practised by the people as it was followed by the Imperial House. But after the death of the Emperor Gokōmyō in 1654, as the usual practice was about to be carried out, a certain fish merchant named Hatshibo complained that this was a cruel and barbarous custom, which it was time should be abolished. The Government took this into consideration, and from that time forth the bodies of the Emperors were not burned.

After this, cremation seems to have been maintained by the *Monto* sect alone; but after the Revolution it was suppressed even here. A year or two afterwards it was again permitted, and now, not only the *Monto* sect, but also many, and perhaps all of the Buddhist sects burn the bodies of their deceased followers.

The reason why the other sects have also become followers of cremation, may I think be referred to the small expense of that process. It is well known what serious losses the temples have lately suffered, and we can easily perceive that Buddhism in Japan now depends wholly on the liberality of its followers. But it seems that cremation offers greater advantages to the priests than interment, because the grave clothes which are made of new white cotton stuff, are buried with the corpse, while in the case of cremation nothing but the corpse of the priest is consumed.

As to the manner in which the operation is conducted, I am able to communicate the following details. In the most ancient times, the burning took place in the open air, as we may perceive from the incident of the blowing away of the ashes of Dōsho. But subsequently this was also the case, for I have been assured of this fact by old servants of the places of cremation who also showed me the places raised slightly above the surface of the earth, which were used for this purpose.

Since permission was granted anew to practice cremation, it can no longer be done in the open air. Very far however from erecting a costly Siemen's apparatus, or something similar, it is done in an incredibly simple manner. A rough wooden house is erected over several fire places lying side by side; the walls are covered with clay, and frequently have two air holes situated on two opposite sides near the ground. The beams and rafters are covered by a roof crowned with a tall round chimney. The fire places are in the shape of a tray, in very shallow hollows of the ground, at most three feet in length and one and a quarter in breadth. Across these trays three or four split logs of wood are placed; and on these the body wrapped in rice straw is laid, the legs stretching beyond the fire-place. By the side of the corpse several other logs about a foot and a quarter in length are placed in a slanting direction, and the fire is lit, the fir tub which is commonly used for the conveyance of the body being also placed on the heap. The burning does not take place in the open, but still the fire is quite an open one, which is however, not fed very vigorously, lest the beams and rafters, which are only twelve feet high, should catch fire.

The above description shows that the corpse lies over a hollow, so that the flames may also catch it from below. The legs, which at the commencement lie outside the flames, are pushed into the fire by the attendants when the burning is somewhat advanced. Although this plan is so simple, a small quantity of wood is sufficient to consume the corpse, so that only the bones, which are burned to a white or grey colour, alone remain. The completeness of the destruction is explained by the fact that in its fat the body itself possesses a large quantity of good material for burning. Coinciding with this, the attendants have observed that very thin bodies burn more slowly and with greater difficulty than those, the fat of which has not disappeared through long illness. The process lasts from seven to eight hours.

We can gather from the expense how small the quantity of wood used must be. Here, as in many places in Europe, three classes which pay 75 cts, 1.50 yen, and 1.75 yen res-

pectively have been established. A very bad clay urn is also provided out of this sum for the purpose of holding the bones. If 1.75 yen is paid, the corpse is not taken out of the tub, but is consumed with it. It occurs less frequently that the family have a large pile of wood put up for the corpse, in which case a price in proportion, namely five yen, is paid.

The process takes place at night and commences generally at eight o'clock in the evening. Next morning the relations find nothing but the bones among the ashes of the straw when they come to bear away the remains of the deceased, in order to have them blessed in the temple, and then put in an urn and buried.

In many cases the teeth are separated from the bones, in order to have them interred apart in the native place of the deceased, if he were burned at a distance from it. It also occurs that the collected bones are sent for interment to the birthplace of the deceased. The urn can be buried on the seventh day after the body was consumed, or from that time at periods of a week until the end of the seventh week.

In one place of cremation I saw a small box containing coins and a shell with yellow sand. The custom of giving the dead small coins was still maintained here. Ten *mon* pieces (10,000 *mon*=1 Dollar) in different numbers, either nine, or as in Tōkiō six, are chosen for this purpose.

But as in this manner a large quantity of small coin disappeared from circulation, people are now content, in consequence of an edict, with printing the coins on paper and giving this to the deceased;—a custom which is also practised in China.

Up to the present I have not been able to ascertain the meaning of the sand. It reminds one of the Buddhist practice of strowing a little sand of Kishiu from Koyasan mountain, in order to remove the death stiffness. When this sand called *Doshu*, is not to be got, a little earth or clay which one scrapes off the wall, is sufficient; and if no priest be present, a favourite of the deceased performs the miracle. At the present time in Tōkiō there are five places where cremation can be performed, the receipts of which are so high, that single temples, which possess no ground at this place, and cannot erect a house for burning elsewhere, acquire possession of a little piece of ground within the concession with the house, at ten times its real value.

At the conclusion of this paper, a discussion took place in which Dr. Langgard observed that he could not well understand how, with such an amount of water as is contained in the human body, such a simple method as the use of a small open fire could produce the desired result; it must be that the softer portions of the body were previously removed.

Dr. Schultze remarked that experience derived on the battle fields of the Franco-German War, is opposed to the statements of the author. Even with the help of petroleum no satisfactory result was arrived at.

Mr. Mayet mentioned that he saw at Canton a stone fire place which was used only for the burning of priests.

At the subsequent meeting of the Society Dr. Doenitz reverted to the subject of the cremation of the dead, and in answer to the objections raised at the last meeting, explained that from his own observation he was now in a position to confirm what he had already stated. The body is burned with a small open fire, without the intestines being removed previously.

YOKOHAMA: SATURDAY, JUNE 15, 1878.

NOTES OF THE WEEK.

FRIDAY EVENING, June 14, 1878.

THE *Gaelic*, twenty-one days out from San Francisco, arrived on Sunday last, and the *Malacca* on Tuesday, bringing the En-

glish mail of April 26th. The *Tibre*, with the Marseilles mail of May 4th, left Hongkong for this on the 10th inst. at noon. The *Tokio Maru* from Shanghai and ports, arrived yesterday morning. The *Tanais* left on Wednesday morning, with the French mail due in London August 5th. Two mail steamers were despatched to Hakodate during the week. The *Saikio Maru*, for Shanghai and ports, left on Wednesday last at 4 p.m. The *City of Peking* is advertised to sail on the 19th inst. for San Francisco.

We are sorry to note from our Bombay files, that the P. & O. Company have experienced a loss. The steamer *China*, which was to have taken the English Mail of the 13th May, was on the night of the 9th found to be on fire forward, and so great a hold had the flames got of ship and cargo, that she had to be scuttled and sunk to save her from total destruction. An attempt will be made to raise her, but the work will be attended with much difficulty and expense, as the vessel was rapidly embedded in sand. Fortunately no interruption of the mail service took place, as the *Kashgar* arrived from China in time to take on the English mails instead of her unfortunate sister ship. The divers who examined the vessel report that beyond the destruction of her internal fittings, the ship is uninjured, but she is eleven feet deep in the mud. The fire is believed to have originated spontaneously, from heating of the cargo, consisting of cotton and oil-seed.

Another account states that she was not actually scuttled, though this was at one time in contemplation, and she had been towed to a mud bank for the purpose; but that so much water had to be pumped into her fore compartment—and all retained there by her water-tight bulkheads, that her draught was so increased forward that she took in water herself at the scuttles of the orlop deck, the large glasses of which had been shattered by the action of the fire. She therefore grounded on the mud at low water, and the rising tide then filled her up to her spar deck beams: after which she settled down as we have mentioned above.

It is curious that both these accounts are from one paper: it does not say much for the sub-editing that such a contradiction should have been allowed to remain unexplained in a Mail Edition: but we are told in the same number, that for the third time in as many successive seasons, the ice supply has failed, which may well account for much carelessness in proof-reading and 'making up' in newspaper offices. The Bombay people, we see, are so irritated by this third failure of the Tudor Company to attend properly to their business, that the threat so often made, so often withdrawn, is at least to pass into execution, and another Company is started to produce artificial ice.

The Congress should have met yesterday, but, up to the moment of writing, the Baron has vouchsafed us no word to tell us that the event has actually taken place. Meanwhile Austria arms; and if Russia is going into the discussion prepared to argue on the basis of Prince Gortschakoff's reply to our dispatch, Congress means little more than War delayed. From India we hear of preparations actively pushed forward to dispatch more troops directly the word is given, the spirit of the people at home continues to rise, the reserve men have come in most readily and cheerfully—an extremely small percentage of absentees being remarked, not more than illness or accident would account for,—and if England is forced to take up arms, Englishmen abroad may receive the news with a calm confidence not usually justifiable; for we have never, at any similar crisis, been so well prepared.

Here, the political horizon is by no means clear. The loss of Okubo is severely felt, and it is evident that the blow of his assassins fell where it could do the greatest harm. Arrests continue to be made daily, and from various parts of the country come rumours of disturbance, riot, and dismay. The subscriptions to the New National Loan do not come in by any means as freely as we should like to see: up to the latest publication of the total, barely five millions have been raised out of the twelve-and-a-half asked for, and of this a large proportion must be called 'perfunctory'—contributions by Government Banks and subsidized public Companies: the savings of the people, if any such hoards exist, have not been tempted forth. There is an uneasy feeling abroad, without much definite, open discontent. Evidently a large party existed in Tosa, which sympathized with the Satsuma rising. Mutsu, the Vice-President of the *Genro-in*, was deprived of his office and placed in arrest on the evening of the 11th instant, his complicity with this party having been discovered. No sympathy can be felt with these men, who were evidently preparing to share the plunder, though willing to let Satsuma bear all the risk. The Minister for War, Yamagata, went down suddenly to Osaka on the 12th instant, his office being temporarily filled by Oyama, a Vice-Minister of the Department. Ministers continue to be carefully guarded, and the Government even appears anxious that extra precautions should be taken by the

Representatives of Treaty Powers. We wish the Government well through the present troublous time.

We hear from Kobe that considerable excitement is imminent there, consequent on an approaching election of a Member of the Municipal Council. Happy Kobe, to possess a Council! and thrice happy, to be able to get up an excitement about anything!! On the ground

'Humanum nihil a me alienum puto,'

We devoted two or three columns of this Review, some weeks ago, to an exposure of an attempt by a discontented minority of the inhabitants of that charming little place—who don't know when they are well off, apparently, and overlook the fact that the charms of their place of residence are entirely due to the wise expenditure of the public funds by their Municipal Council—to disconcert the arrangements of that most excellent Board of Guardians of the public weal. We took to pieces an ingenious, but most palpably fallacious 'Financial Report,' in which the malcontents tried to prove a charge of extravagance against the Council, by the not quite novel method of lumping together sunk capital and annual charges, and debiting five years with the expenditure of eight; and we gave them some sound, wholesome advice. As we had always looked upon the *Huigo News* as a moderately respectable journal, we were surprised to find ourselves, and the writer of the article referred to, assailed, in leader after leader, and in a whole bevy of anonymous 'correspondent's letters,' in language of which we had hitherto believed the *Tokio Times* held a monopoly. The sequel of the business is, that a vacancy having been created in the Council by the temporary absence of Mr. Groom, against whose expenditure, as an active member of the Working Committee, in beautifying the town and keeping it in order, the wrath of the 'economists' was mainly directed—that gentleman, as the representative of the party of order and good governance, challenges the malcontents to a trial of strength by presenting himself for re-election. They put up a candidate of their own, and from what we hear by private letter, are likely to be conclusively and very properly beaten. We shall be extremely glad to hear of this result, as really it would be a thousand pities if Kobe, which is now—solely owing to the unceasing care of a few old residents—quite the show settlement in Japan, and a most bright example to ourselves, were to be spoilt by niggardly, false economy of those who object to pay a trifle for light, cleanliness, and beauty; and who are content to let a whole settlement go to ruin, and be spoilt for their successors, so they may but save a few cents per month on their own ground-rents for themselves. Not without something of that satisfaction with which one hears of justice overtaking evil-doing, do we hear, too, that, as an outcome of this trouble, a newspaper is to be started on the 1st of July, in opposition to the *Huigo News*. A journal which has deserved so ill of its public as this, by lending its aid, as it has done, to the attempt to deteriorate the settlement to which we refer, deserves to experience opposition, and we have little doubt that it will have cause to repent its ill-judged partisanship.

The 'siege of the Grand Hotel' has constituted our little excitement and chief topic of talk during the week. In our last, we noted its purchase by the enterprising proprietors of the Oriental Hotel, Messrs. Bonnat; but 'possession is nine points of the law,' and the purchasers found considerable difficulty in entering on the enjoyment of their property. Some difficulty about ownership of the furniture appears to have been the trouble, and an ancient proprietor was found entrenched in the citadel and refused to give up possession. Fortunately Messrs. Bonnat were without native auxiliaries, as the garrison (i.e. the house and table-boys) were prepared to resist to the death. Legal *parlementaires* of course immediately appeared on the scene, the place was declared in a state of siege, and the non-combatants (in an hotel one can hardly call lodgers *bouches inutiles*) got orders to quit. Hurried packing, much bad language, general stampede, rejoicings at rival hotels, and a great rush to the Club, of course resulted. The next move observed, after thirty-six hours of closed doors, was the erection of a scaffolding all round the fortress, but whether this was for facilitating throwing-in of hand-grenades or for cleaning the windows, was not apparent. Happily, however, some compromise appears to have been arrived at; the commander of the garrison was, with all due ceremony, lifted out of a sally-port, the garrison marched out with all the honours of war, and three tournaments, in three Consular Courts are, we believe, arranged to take place as a final close of the campaign. Messrs. Bonnat will doubtless entertain all the late guests at an inaugural champagne tiffin, to celebrate their own victory, and to welcome their customers' return.

Of course, in common with every one else in the place, we knew, last Saturday morning, that the result of the Derby of

1878 was:—*Sefton 1, Insulaire 2, and Childeric 3.* But, as we announced some time ago, we do not see the advantage to our readers of reprinting for them the telegrams received during the week by the morning and evening papers, nor—as we do not contribute to M. Reuter's profits, do we think it fair to avail ourselves of the news he sells, in such a way as to compete with our neighbours whose names are on his subscription list. We therefore refrained from publishing the Derby news last Saturday, and our readers must allow us to register it now—'a day after the fair'—for our own private record. *Sefton* is an appropriate name for the winner of this great race: the bulk of Lord Sefton's estates lying in Derbyshire, and Sefton, the village from which he takes his title, being not far from the county town. By the way, we ought to have heard whether *Pilgrimage* has added an 'Oaks' leaf to her chaplet, but M. le Baron is not so polite, apparently, as he ought to be, and has forgotten to chronicle for us the winner of the Ladies' Blue Riband.

Our own contribution to the records of the sporting world this week has been a fragmentary sort of Regatta in three acts, performed on Saturday, Wednesday and Thursday. The success of these entertainments always depends so entirely on the caprice of the 'clerk of the weather' that no one could complain that the fun was spread over so many days: and on this occasion, he was in such unusual good humour that the most inveterate grumbler had not the slightest excuse for a growl. On Saturday there was enough wind, but not too much, for the sailing matches and men-o-war cutter rowing races; while, on the other two days, a sea like a mill-pond gave exactly such a course as was wanted for the Club fours and pairs.

As the writer rejoices in such a sensitive diaphragm, or has such a delicate epigastrium, whichever may be the correct surgical form of expression for indicating that he is singularly liable to sea-sickness (when a child, he used to be sea-sick on the ha'penny boats between London and Hungerford Bridges)—that boat-sailing is to him not a pleasure, but a pursuit which he abhors from the bottom of his heart—or his stomach, he therefore entrusted the task of reporting Saturday's proceedings to a friend who represented himself as fully competent to the task. The copy has come in and here it is:—but we receive it with the gravest suspicion, and give it to our readers with a most emphatic disclaimer of responsibility for its correctness. To us, it has not the faintest 'sniff of the briny.' There is nothing in it about 'hauling your wind,' or 'sailing on a taut bowline;' not a word about 'tacks' or 'sheets,' and even the familiar 'marlingspike' is never mentioned. He might have given us a 'marlingspike.' But any how—'vast heaving—bear a hand, my hearties, and belay:—

"The morning of Saturday last, the day fixed for the Regatta, was ushered in by a stiff breeze from the North-East, just the very thing we did not want. Phobus appeared at his best, bright, temperate, and soothing, but Boreas was out of place; rough and blustering, rolling a heavy swell over the bay, and rousing Oceanus from his lair. Zephyr would have been a more appropriate genius to preside over the business in hand. We do not believe that a successful regatta has ever been acknowledged to have been held in Yokohama; certainly not one that has failed to provoke cavilling and ill-feeling. But we may infer that this, in spite of many short-comings, was fairly successful; as at present the only out-spoken grumbler has made his grievances public in the form of a string of queries like a child's catechism, and seeks for answers to things which he says: 'No fella' can understand.' However, as his chief grievance is that the race for open boats was started with a fair wind, instead of sending a score of boats in the teeth of a stiff breeze, we dare say the Committee could find an easy answer, if it were worth their while. We should like to see this 'ancient mariner' cocking his weather eye at some twenty boats trying, in the teeth of a stiff breeze to make an offing,* and we will leave him to the pleasing contemplation of his pet theory of navigation, and turn our attention to the races themselves. The first, for yachts under 30 feet, which was started at 10.15 a.m. requires little description; as Mr. Hiltz' *Snowflake*, 17 feet, took the lead soon after starting, and well rigged, accurately ballasted, and carefully sailed, won by some twenty minutes from her bigger, balloon-belly-sailed rivals. Then followed the race for open boats, of which twenty, out of the twenty-one entries, came to the post. The unexpected number of starters necessitated the adoption of a novel plan of starting, as applied to sailing boats. They were started from a hawser, stretched from a ship's stern to the end of the hatoba, and, from this,

an even start was effected. At the signal-gun, the boats cast off from the line, set sail, and a cloud of white-topped dots scurrying over the bay presented as pretty a sight as landmen or even an 'ancient mariner' could wish to see. The bright sun shone on glistening sails, lending to each a special tint, as, in a cluster, the boats stretched away with a fair breeze towards the Light-ship. The Russians spread their brand-new canvas—kites, sky-sails, and all—but their efforts were of no avail, as Mr. Whitfield's *Zephyr*, making the Light-ship without a tack, gained an advantage which she never afterwards lost; in spite of the efforts of the *Boyan's* cutter, which was admirably sailed, to overtake her, as they came down the back-stretch to the powder-hulk. In fact, the wind was too fair, out, round and home again; it was better than a 'soldier's wind' and no opportunity was given for manoeuvres. The *Zephyr*, as stated, won the first prize, the *Boyan's* cutter the second, while the third fell to the *Thabor*, after a close finish with the *Vladnick*. So ended the morning part of the programme.

"In the afternoon, as the Club races had to be withdrawn on account of the heavy sea, the men o' war's boats had to be made the most of. Worse than all, the heavy sea prevented many ladies reaching the *Thabor*, the head-quarters of the Club for the day, which had been kindly placed at its disposal by the Lighthouse Department, and where preparations had been made for their reception. The band of the *Armile*, courteously lent by Admiral Duburquois, played on board during the afternoon, and made the hours pass pleasantly, while the rival tars struggled for victory. Among the men o' war's men, the Americans had no equals. First and second respectively the *Monocacy's* racing cutters were placed for the two-mile race; and in the All-comers' race, the same crews had the contest to themselves, as, through a heavy sea, their second cutter strove to reverse the decision of the previous race, but without success."

Turning now to the club rowing, of which we do know something, we have first to give a cheerful crow, after the manner of the sporting prophets, at the correctness of our prophecy in last week's issue. The club races had to be postponed and they were fixed for Wednesday and Thursday respectively, thus dividing the labour, to the great benefit of the competing crews. On Wednesday, the water was perfect for the four oared race; shortly after the time appointed, the boats made their way to the starting point; there, some delay occurred in getting them into position, owing to the want of alacrity of one of the crews in taking their place, and to the strong tide setting out that carried the other boats out of theirs, thus crowding out the outermost boat. For this delay, the Committee cannot be held responsible, it is sufficient if the competitors reach the starting point in time, as everyone ought to know who is cognizant of racing, the delays occasioned at the starting point are beyond their control. However, it has now become the fashion in some quarters to harp on this one string, as a stock complaint; we may as well at once declare that on a holiday we should take 'no note of time,' for the prolongation of pleasure adds to the zest thereof. As soon as the fours could be got into position, they were sent away to an equal start; at first it looked as if our remarks of last week were to be borne out to the letter, as in the first dozen strokes, Mr. A. H. Dare, in the new boat, made up his penalty; but then from some unaccounted reason, he fell back and thenceforth was out of the race. Mr. Richmond, rowing thirty-two strokes a minute, forced his boat ahead, gaining slowly but surely, he increased the lead, until, passing the Pacific Mail wharf, he was three-quarters of a length to the good, and his crew unexpectedly well together, considering their practice. They looked as if they could hold their own; past the Creek they still led, but at the commencement of the bund, Mr. J. J. Dare brought up his crew and a spirited race ensued between the two boats, now rowing stroke for stroke. Richmond had dropped down to thirty, and Dare had increased his up to the same number, and almost locked together, they struggled to the French hatoba, where three-quarters of a mile was done, and the race was over; Dare quickened slightly and drew away as he liked, and though the form of the others was maintained to the finish, they had no more to say. We cannot account in any way for the poor show made by Mr. A. Dare's crew; at the middle of the practice they were going unquestionably very strong; but very little attention seems to have been paid to "swing," and when they were asked to race, they fell to pieces, getting short and scratchy. In each of the first two crews, a griffin took the bow-oar, neither were *au fait* at the difficult task of pulling a bow-oar strong and effectively, but both showed considerable improvement on their early efforts, and we hope they will have the patience to persevere. We append names and weights of the competing crews.—

* Heaven forbid that we should be on board any one of them!

Time, 7 minutes.

Mr. Playfair won the Canoe race (paddling) which followed.

Thursday was a perfect day for the performance of the Pair-oar cracks. We have just received the file of the 'Varsity' race, this year shorn of all its excitement, and put back into the category of the 'Sixties,' when the race was a foregone conclusion. We cannot, here in Yokohama bay, with our puny pair-oars, attempt to rival the grandeur of the Easter meeting, either in number of spectators, or in the excellence of our rowing, but we may safely say that we have rarely seen so fine a contest in our bay, as that afforded to us by the contest of the Pairs. Messrs. Litchfield 11st. 9lbs., Mr. C. P. Hall 9st. 6lbs., Mr. Henley coxswain 9st. 11lbs. the holders, contended against the best of the Challengers. Messrs. A. H. Dare 10st. 12 lbs., Mr. J. J. Dare 10st. 10 lbs and Mr. A. H. C. Haselwood 9st. 9 lbs. Both crews came to the post fairly fit; there was no doubt the Dares had the advantage of being in better practice, but in the paddle down, Messrs. Litchfield and Hall showed that they were well together. An even start was effected, the Dares having the best of it, if possible, but this they did not keep long; at the end of a hundred yards Mr. Litchfield showed ahead. Rowing and swinging well to a merry thirty-four per minute, he kept his position against the quicker stroke of the brothers past the P. M. wharf; here the pace of both crews was increased, each man bending his back with a will to the work; past the Grand Hotel alongside the Bund the race was maintained in all the freshness of the competitors, there was no spurring, but every effort was made by the one to increase the advantage he had gained, and by the other to lessen the gap. The boats were so far apart, a distance necessitated by some unfortunate obstructions in the course, that at times it was difficult to judge their relative positions, but both coxswains agree that Litchfield led to the French Hatoba, and from that point it is certain that Dare, by a vigorous and well sustained spurt, drew ahead to nearly two lengths, and notwithstanding a splendid effort made by Litchfield opposite No. 4, about one hundred yards from home, which brought him inch by inch up to his opponent, the Judge's verdict was secured for the former by a bare length. Each of the competing crews have now scored one victory towards the two which are necessary to entitle a crew to the retention of the Cup, and we may expect a renewal of this contest in the Autumn.

On the present occasion, the form of both crews was good, the rowing long and fairly clean; if there was anything to choose between the two, Mr. Litchfield was rowing the longer and slower stroke all the way until he made his last effort, when he worked up to thirty-eight. It seemed to us, as lookers-on, that he was rowing rather tenderly at the beginning of the race, and that in spite of the lead he obtained, he was chary of forcing the pace. Whether that was so or not, we cannot tell, but this we are willing to say, that a gamer struggle could hardly be rowed and that there was nothing to choose between the two at the finish, in point of 'pumpedness.'

NOTES AND QUERIES.

QUERIES.

Qy. 6. Can any of your readers inform me whether there are any, and if so, what books on Japanese surgery, or midwifery, as practised before the coming of the Dutch and Portuguese? (Answered below.) Z.

Qy. 8. Mr. Bramsen's interesting note on the relative values of coins in your issue of February 23th, leads me to think that he or some one else may possibly be good

enough to clear up a few points which have frequently occurred to me:—

1.—Can any one say when, and under what circumstances, paper money was first issued in Japan? "Shosei" in your issue of March 9th gave a most interesting account of the *Han* paper money; and perhaps if there were a general issue before that, some other student may be able to do the same for it.

3.—Can any account be got of the regulations (if any) which governed coining under the feudal system? For instance, under what circumstances was permission granted to certain individuals to strike coins? This seems to have been done at various parts of the country, thus we have Musashi Ichibu, Suruga Koban, &c.

(Unanswered.)

X.

Qy. 10. Can any of your medical or other readers inform me of the recent existence of cases of poisoning resulting from the use of bread made from impure wheat; the symptoms being those described in works on Medical Jurisprudence, as arising from the presence of the *Lolium temulentum* or Darnel grass (or other poisonous *gramineae*) viz; Gastro intestinal derangement, narcotism, vertigo and convulsions.

(Unanswered.)

R. N.

Qy. 11. Many of your readers, when walking towards the new cemetery, must have remarked the *tumuli*, about twelve in number, which dot the table land which lies above Ota on the one side, and the hill of Tobo on the other. These *tumuli* are religiously preserved from the spoiling of the farmer, and must have some history; are they the burying-places of heroes fallen in some old quarrel? Can any of your readers enlighten me?

(Unanswered.)

T.

Qy. 12. In Jules Verne's work, entitled "Michael Strogoff, the Courier of the Czar," occurs a paragraph which touches upon the disposal of political exiles in Siberia. Speaking of their concentration at Irkutsk, during one of the Tartar invasions, he says "some are doctors, others professors, either at the Japanese school or at the School of Navigation." One does not of course, expect absolute accuracy in a novel, but is our ingenious author not a little adrift here! I shall however be glad to know if such an institution really exists.

(Unanswered.)

M.

NOTE TO QUERY 6.—No books on midwifery were written in Japan before the commencement of intercourse with the Dutch, nor did the Dutch introduce any obstetrical literature into the country. The Japanese must be considered as absolutely without any system of midwifery until about a hundred years ago, the attendance upon child-birth up to that time devolving upon women, whose knowledge, if knowledge it could be called, was derived from tradition and whose duties were limited to the simplest manipulations. A physician might be called in, in cases of emergency, but except in the production of lengthy prescriptions, his powers were merely on a level with those of the midwives. Japanese midwifery owes its being to a practitioner named Kagawa, a man of great experience and considerable intelligence but unfortunately led astray by the 'fen follet' of Chinese philosophy. He developed a perfectly original system, of remarkable complexity, but for the most part useless and sometimes even harmful, owing to its erroneous anatomical and physiological basis. It was handed down to posterity in 1775 by his assistant and adopted son. A very interesting abstract of Kagawa's practice will be found in a contribution by Dr. Miyake of Tōkiō in the transactions of the German Asiatic Society for 1876-7.

Surgery had no existence in Japan until the present century, unless the use of the moxa, acupuncture needles, various ointments, and other external applications could be accepted as representatives of the art. Until recently, amputations were effected by a sweep of a sword in the few cases in which the measure was considered justifiable, but in the battle-field, any difficulty arising from a serious injury was generally terminated by the decapitation of the sufferer, a merciful office discharged by a comrade.

Works on various internal diseases date back over 300 years, a good account of *Kak'ke* was published as early as 1566 by a physician named Osada Tokufu.

A.

THE JAPANESE PRESS.

ERRORS IN PROVINCIAL GOVERNMENT.

(From the 'Hochi Shimbun').

THE Governors or Vice-Governors of Provinces, who came lately to Tôkiô to attend the meeting of the *Chihokuwan Kunwaigi*, having now left the capital some days ago, we expect they have, by this time, mostly arrived in their respective provinces; and we presume that at no distant date they will proceed to give effect to the resolutions come to in that Assembly. We think also, that much advantage would accrue if they would, while conducting the affairs of their provinces, avail themselves of the experience they have gained from the discussions in the Assembly and generally during their stay in the Capital. In such event, we are sure that affairs in the Provinces would, on the return of the Governors, undergo a beneficial change. We take the opportunity of referring to a bad practice which has hitherto prevailed there, trusting to the Governors to remove it, in their administration of the new system.

The wish of provincial officials is of course to conduct the government of affairs in conformity with the wishes of, and in obedience to the orders of, central authority. But cases have occurred on which the provincial authorities, being at such a distance from the Central Government, have not thoroughly understood the real spirit of these wishes or instructions: they have mistaken the views of their superiors; and 'guessing'—so to speak, that the wish of the Government would be to bring matters to such a point, have ended by bringing them to one very unexpected. An old proverb says: 'What the high like, the low likes more,' and the inclination of the Central Government being exaggerated by the provincial authorities may occasionally not a little affect the public weal. For instance, when Government was trying to improve education, the provincial Governors devoted their utmost efforts to the end, and by their persuasion, splendid school-buildings have been erected in even the smallest villages. But to see the painted walls of these new schools standing opposite to ruined cottages, is pitiable. Indeed a certain amount of wealth seems necessary, in order to maintain schools, and at present, the people seem rather distressed than otherwise by possessing them. The object of the Government was to improve the education of the people; but the provincial authorities, in carrying out this design, appear to have fallen into the error,—consequent on the idea being transmitted to them through many minds—that if the school buildings were splendidly constructed, the wishes of the Government would be attained.

In this matter of education, however, though the designs of the Government may have been misunderstood, no great harm has been done; but in other affairs in the provinces, the wishes of Government may be harmfully misunderstood. Some time ago, when the Central Government communicated its wish to facilitate the circulation of money by the establishment of banks, the exertions of the Provincial Governors in this direction probably exceeded the proper limit, for the Financial Department had afterwards to modify their original plan. Again, in the case of the recent tragedy at Kioisaka, although we have been unable to find out exactly what were the Central Government's orders to the provinces;—what was notified by the Provincial Governors to the newspapers under their control seems to have been much more precise than the communications made to their contemporaries in the capital. This we noticed on receipt of the papers from the provinces. Certainly these errors do not arise from any ill disposition of the provincial governments, but from their wish to give decided effect, at once, to what they conceive to be the desires of the central power. Hence, concluding the objects of the latter to be good, they gradually extend them, until, unconsciously, they run into extremes. The Central Government issues orders to the Provincial Governors, who deliver them to their officers, who, again, transmit them to the Kucho or Kocho, who execute them, and during this process the scope of the orders gradually expand until, for instance, there may happen instances where 'to raise a loan of money' comes to be interpreted 'to demand a gift of money'—and 'persuasion' becomes exaggerated into 'pressure.' Thus the Central Government's orders, before reaching the people, are liable to undergo more or less alteration, and in the execution of their orders, though originally their nature may be good and they may be such as the people

would approve and cheerfully obey; if pushed beyond the proper degree they may, on the contrary, turn out to be cause for displeasure and grief. Consider:—when an order is issued, before it can take effect, through what course and what an amount of consideration, and through how many hands it has to go. Even if those who issued the orders communicated directly with those who executed them, even then, we think it possible that something would be misunderstood.

What we have written above relates to bad customs which sometimes prevailed in the provinces in old times, but which we now hope to see removed by the wisdom of the Provincial Governors. And though to blame those who, though exceeding the proper degree, or mistaking the proper course, still strive to act in strict accordance with governmental orders, would be too severe:—what we want to see removed is the practice occasionally prevalent, of conjecturing the wishes of Government and taking action to meet them before orders are actually issued. We fully believe, however, that the new law has now put an end to such a bad custom and that it is no longer discoverable anywhere.

EXTRACT.

SHARKS ON THE INDIAN COAST.

(From the "Madras Times")

Those who have read our local columns will have noticed that a Madras native boatman has fallen a victim to a shark, which seized him by the thigh whilst he was swimming in the water, and caused his death in a very short time afterwards. This points an obvious moral. Dark-skinned persons are by no means as "safe," as some suppose, from the attacks of sharks. Fishermen themselves have a cool disregard for sharks that is the more surprising, seeing that this is by no means the first instance of death from shark-bite amongst the numerous band of Madras boatmen, during the last ten years or so. In one year eight fishermen have been supposed to have been carried off by sharks in Madras roads alone. Here, in this recent loss of another Madras boatman, we have the latest and most incontrovertible instance, and it induces us to make a few remarks on the subject. This subject is worthy of study, and of experimentalization. A good deal is known and should be remembered; a good deal needs yet to be known, and that should be learnt by some harmless but interesting experiments.

In the first place, the immunity of the native in water from the shark, is taken everywhere too much for granted. It is true his dark complexion of body renders him less visible in the water than one with a white skin. A white body passing through the water is certainly more noticeable than a dark one, to fish as to man. It apparently gleams, even where the sea is not dark, but seething with silvery foam. A shark might mistake a dark man for a log of wood, but a white man—never! *He is too much like pork!* Habit is a second nature to sharks, in our own roadstead as everywhere else. They have got used to much that is thrown overboard from our shipping, and have a keen eye for anything white—as a broken piece of china, a pith helmet, shaving-paper, or, best of all, as we have said before, fat, white, nutritive (when there is no hook inside it) pork! White man is evidently mistaken for pork by poor innocent sharks. It is only shark-connoisseurs who have learnt, by experience, that a fat black man is an equal luxury; and it is unfortunately indubitable that shark-connoisseurs are increasing every day!

But why do sharks seize men in the water at all? It is known that the majority of sharks do not. Every day, in this our fishing season, swarms of sharks surround especially the great fishing-nets of our coast. They dash eagerly at the fish which escape, but do not touch the swimmers, most of them boys, who literally swarm round the fishing-nets at their outward head. Hundreds of these boys flop about, dive, leap, gambol, and play regular aquatic games round the nets, as they are being dragged in, weighty with fish, by scores of stalwart fishermen on shore. (Heavens! what stalwart, fine, robust, sinewy men our Madras fishermen are:—would they not be capital man-of-war's men in case of more complications with Russia?—This is a gentle passing hint.) In any case, one must come to the conclusion that Madras sharks are either afraid of, careless of, or ignorant of, the succulent nature of the healthy, well-fed, sleek Madras fisherman. It is either—we say it after some consideration—that the sharks cannot quite see and comprehend Natives in the water, or that the majority of them are not *educated*. We will explain exactly what we mean.

In 1866 a Madras officer was leaving this town for England by a well-known steamer. The story we now relate is thoroughly authenticated. A number of his brother officers were on board with him. A very large number of massoolah boats swarmed round the steamer. The boatmen, after their own manner, were shouting, yelling, and jabbering like fiends. An officer who had not yet boarded, stood at the stern of his massoolah-boat, with his legs dangling over the side of the craft. Suddenly all on board heard a terrific yell! They beheld the officer in the boat throw his legs into the air, and descend into the bottom of the massoolah

Just at the nick of time he had saved himself from being amputated of both legs,—and without any fees required for the surgical operation. He had just time to dash himself down backwards into the boat, when a great shark flashed up from the water, beneath his feet. It had darted upwards at his dangling feet, but in the turn, to get the mouth uppermost, had missed the mark, and caught the soles of the young officer on the tip of his nose, and thus fortunately capsize him. So rapid was the movement, however that as the officer fell with a shout into the bottom of his boat backwards, the shark was seen to leap three quarters of its length out of water! And all this was when nearly a hundred boats were alongside the steamer, and there was great noise, and boat-paddles were dashing all round the shark. Then, too, it must be noted that the young officer had dark trowsers on, and black boots. There was none of that "gleam of white" about him, which we have mentioned as being likely to attract sharks in the water. The story we tell is a true one. It can be authenticated. How then shall it be explained? The case is just one calculated to excite curious speculation.

The explanation is such a strange one, that it may take away the breath of some of our readers. We have little doubt that our surmise, however, will, in this and many similar instances, bear investigation. We know that on land there are tigers and tigers. We know that for the most part tigers are simply afraid of man, and slink away from him whenever seen. One tiger out of a thousand does not do so. In the Bay there are thousands of sharks afraid of man, in any shape, regarding him when in the water as a monstrously novel fish. But one in a thousand does not think thus,—from simple experience. That one tiger, that one shark, has somehow TASTED MAN. It is an Initiation, it is a Discovery, it is an Animal Perfection of Bliss! Taste begets appetite; Appetite begets craving. We appeal to Naturalists. We know too well of Man-eating Tigers. Will any one dare to affirm that there are no Man-eating sharks?

The question is one which cannot be dismissed with unseemly levity. Cannibals prefer human flesh to any other. Cannibals, by reason of their species, are the highest kind of reasoning animals,—or, rather, brutes. The highest kind of shark, and perhaps that is the Jamaica ground-shark, is a brute whose dim reasoning approaches, perhaps nearest of all, to the ratiocination of a cannibal. In the myriads of shark-nations in the Bay of Bengal, there are, perhaps, only a few confirmed cannibals. Most of these are probably *gourmets*; but there are few pukka *gourmets*. The former only touch gleaming white-flesh—the latter are not particular as to colour as long as it is flesh, and best of all flesh,—the Human.

Have our readers ever heard the following story of Kingston Harbour, Jamaica? An English soldier was sitting on the low parapet wall which skirts the harbour, fishing. His feet were within three feet of the water. He was intent on fishing. He thought he had a bite. So he had. A ground-shark had suddenly leapt up, and his legs were neatly amputated close to the knees. About that time several strange disappearances took place. Sharks were caught with various kinds of buttons inside them, with American dollars, hairpins, tracts, rings, and satin-slippers. One of the latter was recognized by Mr. Boldero, a retired Major, who had a large estate near Kingston. The toe of the slipper was embroidered in pale-blue silk "Nina." For two weeks Major Boldero had not seen his only and beautiful daughter, Nina. It was suspected that she had run off with Lieutenant Spinks of the South Carolina Rifles. But now the matter was cleared up! She had been swallowed by a shark! The Major was terribly cut up. Spinks would have been a million times better than the shark. He went into mourning. His estate was half neglected. What cared he for money now? But he would have revenge. For one whole year he fished for sharks in Kingston Harbour, and ripped open every one he caught, for traces of his lost Nina. At length he took to employing dynamite, and slew the monsters by the thousands. But his heart had no peace. His head grew grey. His eyes grew dim. Idens began to buzz in his head. He would invent a great wire net which would encircle every shark in Kingston Harbour and rid the coast of Jamaica of each one of the hideous monsters. Every morning before fishing or exploring he used to visit the marble monument he had erected to the memory of his beloved daughter, Nina. And so eight years passed away.

One morning, as the sun was just touching with gold the bosky peaks which arose to the eastward and northward of his estate, and Major Boldero was sitting on a garden beach overlooking the grand, broad harbour of Kingston spreading westward, a little boy and a Negro servant approached. The boy, with fair curly hair, large deep blue serious eyes, and cheeks as rosy as a West Indian sunrise, was evidently barely seven years old; but, quite unabashed, he stepped up to the old Major, doffed his little hat as politely as if he were seventy and not seven, and said:—"Sir, we have come to look at the scenery. Papa and Mamma said we may, didn't they Sambo? (The servant nodded.) Please let me stand on your beach and see the sea. I ain't tall gentleman yet you know, but papa says I will be, if I am a good boy."

The old Major eyed the youngster wistfully. There was something in the boy's frank bold look that made him sigh. He took the child up, stroked his hair, when the little fellow burst out:—"O, there is the sea, and the ships! I do so love ships! But I don't like the sea. There are plenty of sharks there!"

The old gentleman nearly dropped the boy from agitation, as he was holding him up. After a little while he said,—"Won't you have an orange?"

"No, Sir," replied the youngster. "Mamma told me not to touch anything, and I won't. They are coming soon, and if they'll let me, I will eat two oranges."

"What is your name my boy."

"Boldero."

"What!" The old man sprung up erect as an arrow, holding the amazed child before him. "Tell me your exact name!"

"Boldero Spinks, of course,—and here comes Papa and Mamma!" The old man's head sank on his breast. The next moment, the father was holding in his arms his long lost daughter. And the child stood wonderingly by, to see, what he never saw before, his mother sobbing for joy, and an old man also weeping!

This is neither the time nor place to give more than the barest outline of what might make a passable novelette; but leaving the rest to the reader's imagination, we would only give a scrap of a conversation between Colonel Spinks (he had gained his spurs in the Great Civil War) and Major Boldero. The shark episodes had been talked and laughed over, and how the slippers of Mrs. Spinks were lost overboard, &c., when Spinks said,

"Since, Sir, I saw you last, your daughter and I were at first sorely separated by the war. When it was over, we went a year's tour round the world, and on the Coromandel coast of India I learnt the very best way in the world how to kill sharks. There is a port in Southern India which I think they call Tuticorin, where there used to be a lot of pearl-divers. Well, these fellows used to dive down with stiff bamboos, carefully pointed, and tied firmly together cross-ways, each bamboo being about two feet long. When a shark came gliding up to a diver, he would simply stretch out his arm, firmly grasping this cross. As the shark playfully turned to take a good bite off him, he popped the wooden cross as far as it would go down the creature's mouth. Of course the shark immediately tried to snap his jaws together, but that was naturally of no use. So the astonished fish would go flopping and floundering about, wondering what in all the world was in its mouth, and would be found, a week after, starved to death, floating dead on its back in the water, with its mouth still wide open! In Madras, which I visited, I suggested that a number of these bamboo-crosses should be made, and have simply a piece of pork fastened in their centre, and thrown over-board. They would make a host of sharks open their mouths, and keep them open too as long as they could stand it! If tigers and snakes can be kept under, why shall not sharks? I don't know whether the Madras Chamber of Commerce adopted my suggestion."

"Well then," cried the Major, "we will ourselves try it here, in Kingston: and I vote that our first bait be—one of Nina's satin-slippers!"

HOW WE BEAT THE FAVOURITE.

A LAY OF THE LOAMSHIRE HUNT CUP.

"Aye, squire," said Stevens, "they back him at evens;

The race is all over, bar shouting, they say;
The Clown ought to beat her; Dick Neville is sweeter
Than ever—he swears he can win all the way.

"A gentleman rider—well, I'm an outsider,
But if he's a gent who the mischief's a jock?
You swells often blunder, Dick rides for the plunder,
He rides too like thunder—he sits like a rock.

"He calls 'hunted fairly' a horse that has barely
Been stripp'd for a trot within sight of the hounds,
A horse that at Warwick beat Birdlime and Yorick,
And gave Abdelkader at Aintree nine pounds.

"They say we have no test to warrant a protest;
Dick rides for a lord and stands in with a steward;
The light of their faces they show him—his case is
Prejudged and his verdict already secured.

"But none can outlast her, and few can go faster,
She runs in her work clean away from The Drag.
You hold her and sit her, she couldn't be fitter,
Whenever you hit her she'll spring like a stag.

"And p'rhaps the green jacket, at odds though they back it,
May fall, or there's no knowing what may turn up;
The mare is quite ready, sit still and ride steady,
Keep cool, and I think you may just win the Cup."

Dark-brown with tan muzzle, just stripped for the tussle,
Stood Iscult, arching her neck to the curb,
A lean head and fiery, strong quarters and wiry.
A loin rather light, but a shoulder superb.

Some parting injunction, bestow'd with great unction,
I tried to recall, but forgot like a dunce,
When Reginald Murray full tilt on White Surrey
Came down in a hurry to start us at once.

"Keep back in the yellow, come up on Othello,
Hold her on the chestnut, turn round on The Drag,
Keep back there on Spartan, back you, sir, in tartan,
So, steady there, easy," and down went the flag.

We started, and Kerr made strong running on Mcmaid,
Through furrows that led to the first stake-and-bound,
The crack half extended look'd blood-like and splendid,
Held wide on the right where the headland was sound,

I pulled hard to baffle her rush with the snaffle,
Before her two-thirds of the field got away,
All through the wet pasture where floods of the last year
Still loitered, they clotted my crimson with clay.

The fourth fence, a wattle, floor'd Monk and Bluebottle;
The Drag came to grief at a blackthorn and ditch,
The rails toppled over Roscommon and Rover,
The lane stopped Lycurgus and Leicestershire Witch.

She passed like an arrow Kildare and Cock Sparrow,
And Kestrel and Mermaid refused at the wall;
And Giles on The Greyling came down at the paling,

And I was left sailing in front of them all.
I took them a burster, nor eased her nor nursed her
Until the black bullfinch led into the plough,
And through the strong bramble we bored with a scramble—
My cap was knock'd off by the hazel-tree bough.

Where furrows looked lighter I drew the rein tighter.
Her dark chest all dappled with flakes of white foam,
Her flanks mud-bespattered, a weak rail she shattered—
We landed on turf with our heads turn'd for home.

Then crash'd a low binder, and then close behind her
The sward to the strokes of the favourite shook,
His rush roused her mettle, yet ever so little
She shorten'd her stride as we raced at the brook.

She rose when I hit her, I saw the steam glitter,
A wide scarlet nostril flashed close to my knee,
Between sky and water The Clown came and caught her,
The space that he cleared was a caution to see.

And forcing the pace still to make the mare race still,
A length to the front went the rider in green,
A long strip of stubble, and then the big double,
Two stiff flights of rails with a quickset between.

She tore at the raspor, I felt my knees grasp her,
I found my hands give to her strain on the bit,
She rose when The Clown did—our silks as we bounded
Brush'd lightly, our stirrups clash'd loud as we lit.

A rise steeply sloping, a fence with stone coping—
The last—we diverged round the base of the hill,
His path was the nearer, his leap was the clearer,
I flogg'd up the straight and he led sitting still.

She came to his quarter and on still I brought her,
And up to his girth to his breast-plate she drew,
A short pryer from Neville just reach'd me, 'The Devil !'
He mutter'd—lock'd level the hurdles we flew.

A hum of hoarse cheering, a dense crowd careering,
All sights seen obscurely, all shouts vaguely heard,
"The Green wins!" "The Crimson!" the multitude swims on,
And figures are blended and features are blurr'd.

"The horse is her master!" "The green forges past her!"
"The Clown will outlast her!" "The Clown wins!"
"The Clown!"

The white railing races with all the white faces,
The chesnut outpaces, outstretches the brown.

On still past the gateway she strains in the straight-way,
Still struggles, 'The Clown by a short neck at most,'
He swerves, Neville scourges, the stand rocks and surges,
And flashes, and verges, and flits the white post.

Aye, so ends the tussle, I know the tan muzzle
Was first, though the ring-men were yelling "Dead heat!"
A nose I could swear by, but Clarke said "The mare by
A short head." And that's how the favourite was beat.

THE HOUSE KEEPER.

MARKET PRICES OF MEAT, VEGETABLES, GAME, &c., &c.

YOKOHAMA MARKET REPORT.

FRIDAY EVENING, June 14th, 1878.

IMPORTS:—So little business has been done during the week, that no real change is observable in imported goods. The stocks are increasing steadily, and there is no prospect of an improvement at the moment. YARNS are nominally better, but the quotations are seller's figures, not those of buyers, and any operations on a large scale could only be concluded by a material concession on the part of the former. A few pieces of SHIRTINGS have changed hands at low prices, and about 11,000 pieces 7lb. T-CLOTH, TURKEY REDS, and VICTORIA LAWNS have been sold at quotations. The complete business recorded is so small as to require no further notice.

No further deliveries of "Contract" Yarns are recorded, while arrivals have reached 1,637 bales as against sales 527 bales.

EXPORTS:—TEA. Business during the closing week has been to great extent influenced no doubt by a report which was current in some places that a reimposition of Tea Duty was contemplated in the United States. Prices hardened from \$1 @ 2 per picul for two or three days, in consequence of the great increase in settlements, which amount to Pels. 8,750 for the past seven days, but the rumour apparently having no good grounds, the market has quieted down and now shews no alteration on last week's quotations.

The S. S. *Glenorchy* has been laid on for New York *via* China Ports and Suez Canal, and has despatch promised by the close of this month; rate of freight reported at £3.10 per 40 feet.

EXCHANGE:—With nothing doing in Silk or Imports, this market has naturally been extremely quiet during the week. A little at ½d and a little, 60 ds, at ¼d, comprehend all the transactions in Bank paper: while operations in Private Bills have been confined to a fair amount of credits at 4s. 0d. against tea. Nothing beyond a very trifling business, chiefly for Chinese remitters, has been transacted on Hongkong or Shanghai.

*. The dates of Arrival and Departure of the Mitsu Bishi Company's steamers are susceptible of alteration, consequent on the necessity imposed upon the Company—by its contract—of connecting with the steamers of the Pacific Mail.

*. No days for Arrival or Departure of the Pacific Mail Company's or Occidental and Oriental Company's steamers having as yet been fixed, we are unable to tabulate them. Each separate steamer's departure from her port will be notified in the Table below, and the day of her probable arrival at her destination.

*. Three days are allowed in the P. & O. Company's Schedule for transit of the Mails between London and Brindisi.

*. Two days are allowed in the Messageries Company's Schedule for transit of the Mails between London and Marseilles.

CHINA, JAPAN, AND 'THE MOST FAVOURED NATION CLAUSE.'

A FORTNIGHT ago, the *Nichi Nichi Shimbun*, generally thought a well-informed, and currently reported to be a semi-official journal, published a very extraordinary account of conversations in which H. E. Mori Arinori, ex-Ambassador to China, was said to have borne part. He was represented to have nearly lost his temper, when taking leave of the members of the Tsung-li-yamên at Peking, and,—in reply to their expressions of good wishes for his welfare and hope of his speedy return,—to have told them roundly that he saw no use in his returning, since he could not get from them what he had come to Peking to obtain,—concessions and increased facilities for trade beyond the original treaty. Next, it was reported that,—having remarked that when the rice subscribed by Japan for relief of the famine-struck Chinese arrived, the Tsung-li-yamên appeared by no means grateful, or even pleased,—he commented upon the circumstance at Tien-tsin to Li-hung-chang, on his way down through that place. And the Chinese statesman is said to have burst out laughing, and replied that, as they had neglected their duty, the Tsung-li-yamên probably felt humiliated at Japan having been beforehand with them in the relief of their own people. Thirdly, the *Nichi Nichi Shimbun* told us that the Chinese Ambassador here explained to Mori why his demands for revision of the Treaty had not been conceded—viz: that other foreign nations could, and would, have immediately demanded the same advantages. The report of this conversation was admitted by the *Tôkiô* journal to have reached it by transmission through several hands, and a few days afterwards,—the whole story having been translated and commented on by the foreign press here,—it was withdrawn *in toto* as 'having been proved, on enquiry, to be without any foundation in fact.'

We do not believe that H. E. Mori Arinori is in the least degree likely to have made such a mistake as that attributed to him in the first paragraph of this report: he has had sufficient experience in diplomacy to assure him against the commission of such a blunder, which would moreover have been a grave breach of Oriental etiquette. But the remark of Li-hung-chang about the charity rice is too characteristic of the man to let us believe it untrue and—deny it as the *Nichi Nichi Shimbun* may,—nothing is more likely than that such a reason as that put into his mouth by the paper's informant was given by the Chinese Ambassador here to Mori for the failure of his mission. This is precisely the true reason why Japan cannot get from China any extension of the original provisions of her treaty with Japan; and though, with respect to the other matters referred to—as private affairs between the two nations in which foreigners are in no way interested,—the foreign press has no concern with them, it is different with regard to

this latter conversation. This has a distinct interest to foreigners, as bearing on the great question of the opening of China, and, as such, is a legitimate one for discussion.

The 'most favoured nation clause' has generally been considered by publicists as possessing, at best, a doubtful value. It has its advantages. It is a great safeguard to a nation against carelessness, indolence, or want of knowledge on the part of the Envoy Plenipotentiary to whom is entrusted the framing of a Commercial Treaty; it ensures, not only that all advantages previously gained by abler or more industrious negotiators shall be secured,—but also anticipates the possession of any that may be hereafter conceded, as, from Time and Friendship Trust is born; and as between the various nations having co-partnership in the arrangement, it is useful; giving all a fair start in the racial race. But we have an opportunity, now, of seeing how heavily it can be brought to bear against the common interests of all. Those who rejoiced when Japan made a Treaty with China,—that at last we had found the key wherewith to open the hitherto impregnable gates of Chinese pride and prejudice, to gain an entrance for our commerce into the largest market of the world, now find the 'most favoured nation clause' used by China as an additional and a most formidable bar. Clearly, in this case, it would have been well for Western nations, had Japan been able to march before us as pioneer, have shown China by her own example that coined money is a more convenient medium of exchange than lumps of silver; that vaccination is a preservative against small-pox; that Western medical science generally is a blessing to mankind, and that Western jurisprudence, and humaner methods of punishing criminals, Western literature, science, and habits of thought generally are more conducive to happiness than the practice and principles hitherto prevailing in the Far East. Granted that Japan might have got a start of us commercially, and, for a time, have enjoyed the possession of markets from which we were debarred, her advantage would only have been a temporary one, which we need not have grudged her, in exchange for the great good her entrance into jealously-guarded China would have effected, in proving that Trade has not necessarily Revolution as a companion, that the erection of a Mint does not involve the downfall of a dynasty, and that telegraph wires, railroads and postal services, do not inevitably lead to the partition of an empire,—while, on the other hand, they do add greatly to the power of a despotic government. It is true that the first of these propositions may not have seemed to them self-evident,—in face of the coincidence of the fall of the Shogûnate following so closely on the signature of the Foreign Treaties; but the Shogûnate was an usurpation of power by a subordinate, with which the Government at Peking would not have much sympathy; and, besides, though it has been generally held that the downfall of the dynasty of Iyeyas was hastened by our advent, fuller know-

ledge of the history of the time does not confirm this theory. Many facts might be adduced to show, on the contrary, that had the last Shogun been a man of firmer character, he could have maintained his position by the aid of foreign support. Whereas the Formosan expedition, we know, has made a great impression on the minds of Chinese statesmen, and they must have seen that the facile suppression of the formidable South-western rebellion last year was entirely due to the power to mass overwhelming force on special points, which this Government possesses in its system of telegraphs and large fleet of foreign-built steamers. The report that the Woosung railway plant is to be used in Formosa, for military purposes, goes to show that the Chinese are by no means blind to the occasional advantage of rapid transport of men and material; and had not 'the most favoured nation clause' opposed the growth of commercial intercourse between China and Japan, it is only reasonable to suppose that Japanese activity might have, in other matters, stimulated progress.

As journalists, we may perhaps be thought to lay too great a stress on the importance of education of the people by means of the printing press—to put too great a value on newspapers and the work they do; but no man who has watched Japanese progress during the last ten years, no man, especially, who has lived in the country, and been on terms of familiar intercourse with the educated classes of its people, but must have remarked the growth of culture and the great development of intelligent curiosity which are mainly attributable to the labours of Japanese journalists. All subjects—political, historical, commercial, social, are eagerly discussed by them. Restricted to a considerable extent, as they still are, in their debates on the politics of their own country, and ignorant, as they necessarily are, of those of foreign nations, the essays on such topics which appear in their columns are feeble and crude in the extreme. But where greater latitude is permitted to them, and where they have fuller knowledge, as upon questions of commerce, they often write sensibly and well, and always with a truly patriotic desire for the advancement of the nation. They seek in foreign newspapers, and from their foreign friends, for information on mercantile subjects, and collect for their readers a mass of information on the details of foreign manufactures and foreign science, as applied to commerce, which is really surprising. An active, pushing, inquisitive people like this could not fail, were freer intercourse permitted them with their neighbours across the China Sea—were they allowed to settle and trade there, bringing with them their newspapers, telegraphs, railways and postal service, their kerosine lamps, tailoring and book-making machinery, their silk filatures and tea-firing machines, and all their multifarious new adaptations of Western mechanical ingenuity—to stir up the Chinese to follow in their steps. So far, all that China has sought to borrow from Western science has been directed to improvement of her powers of offence or defence. The Government has spent large sums in the creation of ship-building yards and arsenals, in stores of cannon, arms and ammunition, and in machinery for their manufacture. But the Government alone has done this, and no encouragement has been given to the arts of peace. The people have been debarred from availing themselves of Western invention for improving manufactures, facilitating transport and inter-communication, and developing the resources of the country, especially its mineral resources. Whereas, in Japan, Government assistance in the form of subsidies, loans, or contracts for the products of industrial enterprises, have been always most freely given; and were Japanese allowed to do in China what they are doing here—opening coal, iron and copper mines, raising and refining petroleum, &c., &c., Japanese capital,

native or borrowed, would be easily found for the work. And the intercourse with the Chinese commercial classes would, in return, greatly benefit Japan. From whatever cause—probably from the long period of degradation of *status* which has oppressed the merchants of Japan, the uncertain tenure of their wealth and the necessity which compelled them—under the feudal system—to affect poverty to escape exaction—it is certain that the moral tone of Japanese commercial men is lower than that of their Chinese neighbours. Breaches of contract in a falling market, embezzlement of foreign money entrusted to natives for the purchase of produce, and other faults which are common here, and which greatly check the development of trade, by frightening away capital, are exceptional in China. And besides that the Chinese merchant could teach the Japanese the advantage of keeping faith and the value of credit, he might give other useful lessons most valuable in trade. In perseverance, in patience, in caution, and—greatly—in steadiness, the solid Chinese merchant is far superior to the flighty, excitable, speculative and thoughtless Japanese. For all these reasons, and for others, which we have now no space to enumerate, it is to be regretted that Mori's efforts to extend Japanese commercial intercourse with China have failed, and should the failure be attributable, as stated, to the existence of 'the most favoured nation clause' in Foreign Treaties, it really becomes a question whether—when opportunity occurs for their revision—it would not be advisable that the clause should be struck out.

THE TEA DUTY SCARE.

THE dispatch to the United States of 28,479 packages of Tea by the *City of Peking* to America, so soon after 20,867 packages had been sent away by the *Belgic*, indicates more than the legitimate progress of business at this period of the season: and all teamen are, we believe, agreed in attributing the increase to the stimulus of the report that the re-imposition of the tea-duty has been again proposed to Congress. It is always uncertain whether that Assembly will accept or refuse the proposition, and it is this uncertainty which is chiefly harmful to the trade. There is no reason whatever why Tea should not be moderately taxed. An article of general consumption, and cheap, it is just one of those from which a Chancellor of the Exchequer can derive considerable revenue without unduly oppressing the people. An enormous amount of nonsense has been spoken and written about 'a free breakfast table' for the artisan;—the fact being that, in their own line, the artisan class are amongst the most extravagant of any community. The artisan—of course, we refer to the skilled labourer who earns good wages,—is not by any means a consumer of cheap tea and, in proportion to his income, spends infinitely more upon this and other edible luxuries than the merchant or landed proprietor. Nothing but new-laid eggs, the best of milk and fresh butter, French bread or hot rolls, with a relish in the shape of ham, bloater, or rasher of bacon, water-cressacs or shrimps, compose the breakfast and afternoon meal of the 'artisan,' and cheap tea he utterly repudiates. Threepence or even sixpence a pound added to the price of his tea is an item that in no way alarms him in his wife's weekly expenditure and, from the nature of the trade, it is not upon him, the consumer, that the increase of duty wholly falls—as he never, either, gets much of the benefit of a decrease. The profits made by the middlemen between importer and consumer are so great, while the competition between the dealers in the article is so keen, that before the wave of increase can reach the artisan, it is split up and divided to such an extent that he does not feel its impact. Whereas it is from moderate duties on such articles as Tea, of

general and continually increasing consumption, that revenue can be most easily raised and can be most certainly depended on. Not a murmur is heard when the necessity of a country, such as war, compels the imposition of an indirect tax on such an article. The consumer always reflects that he can easily save the extra amount in price—and, as he knows, very small share of it falls on him—by consuming less. But nevertheless he does not consume less. He may say at his breakfast table that now Tea is going to be dear, it must be carefully used, but at the year's end—if he kept detailed household accounts, which he does not, he would find that not a pound less of the luxury had been consumed.

It should also be remarked that in all the cases of removal or reduction of duties on such articles as Tea, Sugar, &c., it has never been the consumer who has agitated for the reform. It has always been the importer or wholesale grocer who has raised the cry, and put forward the consumer, who never opens his mouth, as the stalking horse behind which he brings down his own game. And when the duty has been reduced, it is he again who profits by it, sharing the plunder with all his subordinates down to the retail grocer. The consumer who asks, when the half-pound or pound of tea is purchased, why the packet is not threepence or sixpence cheaper than formerly,—since that amount of duty has been taken off, is told that he gets the benefit in the shape of a better article, that the present packet is threepence or sixpence better in *quality*,—and he goes away perfectly satisfied, though the tea has really come out of just the same old stock.

To the importer, the imposition of a moderate duty—and we must be understood to be arguing in favour of only a moderate impost,—of a productive, not of a protective duty,—matters not a whit. The duty is calculated among his charges and affects proportionately the price he can afford to give for his tea, here, or the price at which he can afford to sell it, there. But what he detests, what disturbs his calculations, and dislocates his trade, is uncertainty. This possibility of re-imposition of the tea-duty in America, for instance, has been presented to him, three times during the last three years of this country's tea-trade with the States. The consequence is, of course, a sudden demand, in order to get as much into stock as possible before the duty comes into operation, a consequent stiffening of prices here and the excitation of baseless expectations in the minds of tea-grocers. The duty is not imposed, and then re-action sets in, the unnecessarily large stocks have to be cleared off at a loss, the purchasing markets here become dull—for the native, always eagerly responsive to a rise, is never ready to accept his share of a fall; and,—generally,—there recurs what we have called a 'dislocation' of business relations and of trade. Let the duty be put on, once for all, and kept on—the trade can very well carry it, as it has carried it before, but the tea-merchant may well cry 'Save me from my friends'—when they first frighten him into buying more than he wants and raise foreign values by the threat of imposing the duty, and then depress the home value of his over-stocks by not doing it. Fortunately the Japanese newspapers, which are increasing in circulation at a marvellous rate, give a great deal of their attention to commercial subjects like this, and some writers in them are quite capable of understanding the reasons for such sudden and increased demand as we have just witnessed, and they explain them to their clients. Still, though the mischief done is rather less than before the existence of such *media* of information to the tea-grower, it is only, as yet, slightly diminished, and enough remains to justify us in deprecating its cause, in those columns, in the interests of Japanese tea-growers, as well as in defence of foreign tea-buyers.

THE STRENGTH OF ENGLAND.

SOME time ago, one of the native papers speculated on the probable consequences of war between England and Russia upon foreign trade generally, and particularly on that of England itself, predicting a variety of disasters and anticipating great loss to English commerce. As we mentioned then, the very trifling increase in marine insurance made to cover war risk, at that time, when war seemed far more imminent than it does now, was of itself a sufficient answer to the native critic. We quote, in this issue, an article from *The Times*, which affords not only a most instructive lesson to Japanese journalists, as to the real condition and strength of the English Empire compared with that of Russia, and the immensely, almost incredibly superior amount of our resources, and ability to bear taxation; but the perusal of which ought at the same time to reassure such Englishmen—of whom we regret to say there are not a few—who have doubted and almost despaired of the fortunes of their country. The article should have, for the Japanese, additional and special interest, as showing to what development, under her commercial and colonial system, the commerce of England has grown, and, especially, how rapid has been its growth during the Free Trade period. Japan aspires to be a manufacturing nation, apparently, and though we would by no means be understood thereby to commit ourselves to approval of her desire,—because the question is yet in abeyance whether she should not rather devote herself to the production of raw materials,—we may say that in the study of the example of England, and of her manufacturing history for the last thirty years, she may find the way to become one.

In modern warfare, expenditure has to be so infinitely greater than formerly, that the power of supporting taxation is as important an element of success as that of massing large bodies of troops. The Franco-Austrian, Austro-Prussian, and Franco-German wars were all necessarily short wars, because none of the nations engaged, whether victors or vanquished, could bear the strain of expenditure necessary to keep in the field such enormous bodies of men. But in any war in which England may engage, she has these two great advantages: she has no need to keep on foot an enormous army, whereas her resources are practically inexhaustible, and any enemy must become bankrupt before, in England, taxation becomes even oppressive. It may be said that fleets cost as much as armies; but then it must be remembered that, for the protection of her commerce and the police of the seas, England's fleets have always to be kept up, and the difference between Navy expenditures in peace and war is trifling compared to that between the peace and war budgets of continental armies. Not that the military resources of the Empire are at all less than those of her Navy, but they require developing. They cannot be so rapidly mobilised as those of Germany, Russia or France; but, counted as these countries' forces are by hundreds of thousands, our's would, as war went on, necessarily outnumber them, on account of our having such enormous reserves of population to draw upon. As *The Times* very accurately argues, England is not only the little island in the North Sea, with a population of 28,000,000, but the greater England, extended over all the world, with a colonial population of 250,000,000; and, being unassailable in its centre,—England proper—nothing but time is required to draw from such a population, such masses of troops as would be far more than we should require in any possible contest. And, meanwhile, the pressure of expenditure, which would be crippling our adversaries, could be most easily borne by ourselves. The statements of Mr. Farrer in the *Fortnightly Review*, which form the basis of *The Times'* article would be incredible, did we not know that his position as Secretary of the Board of Trade enables him to make them

with authority, and with certainty of their being correct. Imagination almost fails to grasp the meaning of such figures as £8,600,000,000—yet eighty-six hundred millions sterling is pronounced, by the best statistical authority, to be under, rather than over, the amount of the capital possessed by the people of the United Kingdom: and over three-quarters of this—£6,600,000,000—has been accumulated within the last sixty years. What are the expenses of a three years' war to such a mass of wealth as this? The Crimean war cost us a hundred millions and more; yet in twenty years, this cost has been entirely wiped out of the country's books: our National Debt is now less than it was in 1857, at the close of the war with Russia, though we have since had also to bear the cost of suppressing the formidable Indian Mutiny, and of a number of petty, but expensive contests in various parts of the world. As *The Times* shows, the assessments to the Income tax, only one source of revenue, were in 1875 £536,000,000, four times what they were sixty years ago, and whereas, in 1815, the people of Great Britain, with an average income of £25 per head, could spare one hundred millions sterling for the purposes of the State, it is clear that a population doubled, and enjoying an average income of £50 per head, could not only spare two hundred millions, but a very much larger sum. And what other nation in the world could do this? Certainly not Russia, with her existing revenue of seventy millions only, raised with much difficulty and with such pressure of taxation, that it is doubtful now, whether her people could bear an extra squeeze for ten millions more, and more than doubtful whether her present Government dare venture another turn of the screw. Whereas, with our Income tax at 3d., and not a dozen sources of indirect taxation used, we raised seventy-nine millions last year, from a population a third of Russia's, and without an effort.

We do not wish to write more of a paraphrase of *The Times'* article, nor is it with any spirit of boastfulness or vain-glory that we have written so much; but these are 'facts not generally known.' We strongly recommend to our readers, native and foreign, the careful perusal of the article in its entirety. They will rise from it, as we have done, with the conviction that the conclusion of its able author is correct:—'that our power is so great and manifest that we may abstain from mere display'—that we may treat with indifference the notion that our calm reliance on our latent strength, and abstention from interference in others' quarrels, indicate decay of national spirit; that, except where our own interests are involved, we may safely sit quiet, and that if we thereby incur what is called 'loss of prestige,' we can afford to do so;—that, to conclude in the very words of the writer:—

"The strength we have acquired during long years of peace, and our daily growing strength as our numbers and capital increase, should dispose us to be less and not more jealous of alleged encroachments—more and not less disposed to go our own way, and pursue our own policy, as we see other nations oppressed by the burden of enormous armaments and wasting every now and again in a few years or months of war the fruits of many years of peace."

WE have to put on record the following Government Notification respecting the storage of grain:—

NOTIFICATION BY THE OKURASHO,
(FINANCE DEPARTMENT.)

No. 27B. 20th day, 6th month, 11th year of
Meiji (20th June 1878.)

To *Fu* and *Ken*.

It is hereby notified that, as a *Jo-hei Kiyoku* (sub-department to administer the storing of rice, corn, &c.) will be established and opened on the 1st day of the 7th month next, (1st July) all communications upon matters concern-

ing rice, corn, &c., which have hitherto been made to the *Suitō Kiyoku* should be addressed to the before-mentioned office from and after the above-mentioned date.

(Signed) OKUMA SHIGENOBU,
(Minister for Financial Affairs.)

EDITORIAL NOTES.

REFERRING to what we have written elsewhere on the Duty Scare in this country's Tea-trade with the States, last mail brings us news of something similar in the London market.

At the commencement of April last, when the Chancellor of the Exchequer's Budget was on the point of being laid before the House of Commons, an increase in the duty on Tea was anticipated as a very probable war-tax, to aid in providing for the six millions just voted, and between the 1st and 4th of April, the London dealers cleared no less than fourteen million pounds of Tea—figures which, by the way, will give our native readers some notion of the magnitude of the trade.

The Income tax and Tobacco duty were increased, and Tea left untouched, until a further stage in the European quarrel; but that the merchants who paid this large amount of duty on speculation were wise in their generation will be allowed by such of our readers whose memories can carry them back to the days of the Crimean war. These will remember that in the April of 1855, the Tea duty was raised in one day from 1s. 5d. to 1s. 9d. per lb., and several dealers who had foreseen, as now, the possibility of the increase, made large sums of money by clearing their stocks; one firm, known to the writer, being reported to have cleared £10,000 and another £4,000 by the transaction. History has not quite repeated itself on this occasion, and it is to be hoped that the Congress now sitting in Berlin will succeed in averting from Europe the evils of war and establish on a firm footing peace and good-will, though far-seeing or well-informed tea-dealers may perhaps miss a good chance of making small fortunes in an afternoon.

THREE of the leading papers of the capital have been busily engaged during the last fortnight, in the discussion of the all-important question of the circulation of the Trade Dollar. We attempt, in the columns which we dedicate to translations from the native Press, to reflect, as far as possible, Japanese opinion upon the questions of the day. Our space is not sufficient to enable us to do this fully, and we have necessarily to select such essays for re-production as bear upon the question most important for the moment. To a journal like this, which is—before everything, a Commercial Review, subjects so vital to Trade Finance and Currency must necessarily occupy a large share of our attention. This must be our excuse for taking up so many columns as we do to-day, with the discussion of this single question. It will be remarked that the balance of native opinion is in favour of a single standard—silver, and that the point we made in our first article on the question has been at last picked up:—that a prime necessity for success in the crusade against the Mexican Dollar is that it should be disabled,—by Treaty Revision,—from competition with the nation's own coinage:—a concession which no reasonable man or diplomatist would deny. It remains for Japanese journalists and Japanese Ministers to appreciate the truths—that a coin of 420 grains, though intrinsically better, is financially at a disadvantage in comparison with an established coin of the same denomination, of 417.60 grains; that the former will never supersede the latter in these markets; and that the Mexican can only be supplanted by a coin of precisely the same weight and fineness. They may call it 'dollar,' 'yen,' 'trade dollar'—what they will; but 'to this complexion they must come at last,' if Japan is to take Mexico's place as the source of a coined medium of exchange for the trade of the Far East.

ON THURSDAY, (20th inst.) the first parcel of new season's Silk arrived on this market: consisting of four bales of Hatchoji hanks, a very mixed lot, about No 3, little 2½. They were secured by one of our buyers at \$520 @ \$525 per picul. At the time this was considered

a fancy price and we hear that the silk has since been inspected and finally settled at \$490.

Yesterday, about ten bales more arrived, in several parcels, consisting of Takasaki and Hatchoji hanks, but for these, holders and sellers have, up to the moment of writing, been unable to come to terms. Holders are asking about \$540 @ \$550 per picul, and the most sanguine buyers have, so far, not offered more than \$510, which price, even, appears to us too high, considering the last advices received from home.

It is to be hoped that buyers, merely for the sake of competition, will not be led to pay prices which are not justified by our European news: as such action tends greatly to mislead the Japanese merchants here. Not understanding our application of 'fancy' to business, or not believing in the exceptional character of such transactions, they buy, or contract in the interior at proportionately high rates; thereafter becoming difficult to deal with, when the attempt has to be made to lower their subsequent pretensions, and are then obstinate in their endeavour to evade the heavy losses into which they have been beguiled by the indiscretion of one or two early buyers.

YOKOHAMA: SATURDAY, JUNE 22, 1878.

NOTES OF THE WEEK.

FRIDAY EVENING, June 21, 1878.

THE *Tibre* with the Marseilles mail of May 4th arrived on Monday last. The *Orissa* with the London mail of May 10th is expected to-morrow, having left Hongkong on Saturday last at 4 p.m. Early next week, the *China* from San Francisco on the 4th inst. may be looked for. The next outgoing mail steamer is the *Volga* leaving on Wednesday morning next, her mail will be due in London August 19th. Two inward and four outward steamers have arrived from and departed for Hakodate; and the usual Shanghai and coast port steamers have arrived and departed during the week. The *City of Peking* left for San Francisco on Wednesday last at 11 a.m.

That we should have left ourselves scant space on this occasion for our 'Notes of the Week,'—that there should be little to write about, and that the writer should feel extremely 'out of form' for what he usually regards as a pleasure, instead of a task, are circumstances which combine into a coincidence, perhaps more convenient for ourselves than comforting to our constituents. But over circumstances, control is often wanting, as the proverb tells; and a rising thermometer, with a barometer indicating increased pressure; want of 'straw' out of which to make our 'bricks'; a variety of mental botherations of no interest to any one but their proprietor; and—on the top of everything—considerable physical discomfort, are not—taken all in all, such as we care to see their like again—as Shakespeare says,—or words to that effect. It is therefore to be hoped that to this hebdomadal record of events is applicable that great truth enunciated by another English poet:—

'Man wants but little here below, nor wants that little long' (which is probably the reason why cabmen, watermen, *et id genus omne* invariably ask one for 'something short');—for certainly on this occasion we shall be brief, though we may lay no other claim to be amusing.

The event which has most interested mercantile Yokohama has been the departure of the P. M. S. Co's *City of Peking*, with a very large cargo of new teas. As she made, from Hongkong hither, the fastest trip on record, she is expected to land her fragrant burden in San Francisco in some hitherto unbeaten time. A good deal of grumbling was heard on the day of her departure,—not without cause. She stood too long on the order of her going, instead of going at once, and merchants and bankers lost a night's untroubled rest, from the Agent's inability or neglect to fix the hour of her departure. Advertised to go at daylight on the 19th,

she did not leave till nearly noon, and but for an act of kindly courtesy on the part of one of the gentlemen in the office,—who went round the settlement at midnight to communicate the fact unofficially that her departure would be postponed, no one would have known it, and correspondence clerks and deputy-accountants would have been out of their beds all night. It was bad enough, as it was. No official notice was given, and yet, surely, the impossibility of her getting off at daybreak next morning must have been known to the Agent (if not, it should have been) before 10 p.m. The commercial public justly felt aggrieved at this omission, and though peace was patched up in the way we have mentioned, this harmony requires to be properly fostered, if the Company and its constituents are to remain on good terms. The same fault has to be noticed occasionally at another centre of trans-Pacific dispatch, and if both Companies are not more careful in future, the Banks may be roused to interfere. The despatch of these steamers, running as they do at unfixed dates, is virtually under the control of these latter institutions, as we may, perhaps, some day indicate.

We have received, too late for insertion this week, another letter from 'Nauticus' on the management of the national steamship line. This impecunious concern has been advertising itself at Osaka, we see, by entertaining the public with nautches, illuminations, fireworks and free *sake* for a week or ten days, as a commentary on their Manager's report of virtual insolvency, or in commemoration of the consequent rise in rates of freight and passage. 'Nauticus' letter will appear next week.

Nine days since the European Congress met, and still no news. The Southern line is out of order: that no public messages should be allowed to come by the Russian line looks as if affairs were going badly for the Tsar.

The political excitement mentioned last week continues in Tokio, and arrests of Tosa men and of supposed sympathizers with them are made daily. It is reported that Itagaki has been arrested, and Goto Shojiro is freely mentioned as being in danger; but though we have fair foreign authority for stating these circumstances, our native correspondent in the capital tells us nothing about them. The rumour that Tani, the defender of Kumamoto, had been assassinated, or attacked, is untrue; but the Kochi *ken* is in a state of excitement, troops have been called out, barracks prepared for defence. By no means an insignificant fact is the announcement that Government intends to buy up all fire-arms, except fowling pieces, in the possession of private individuals. One of the Tokio newspapers has an article on the subject, commending the measure. Apparently, one of the charges brought against the ring-leaders of the Tosa plot is founded on their accumulation of munitions of war. The Government is quite right: private individuals or clubs have no need of rifled cannon.

The Mikado's progress through the North and West is, however, to be persevered with, and H. E. Hayashi, Junior Vice-Minister of the Home department, is to leave Tokio about the 10th proximo, with a suitable staff, to make the necessary preparations along the Emperor's route. The new men-of-war recently arrived from England, are to proceed northwards at the same time. During the week the Minister of Public Works, Ito *sangi*, has inspected the vessels. The *Tsukuba-Kan*, the vessel which carried the Japanese flag into Australian waters, returned hither last Friday from Sydney, having left port on the 27th of April.

H. E. Yamagata, Minister for war, is inspecting the Osaka garrison, and the troops all over the country are in a thoroughly effective state. There is no chance of successful insurrection against the present Government, so that these abortive attempts and consequent excitement, are all the more regrettable.

The Internal Loan progresses slowly; about 6½ millions have been subscribed, but much of it by Governmentally subsidized or supported institutions. The people do not subscribe spontaneously, and what has been got from Kwazoku, monasteries, banks and Public Companies, has not been obtained without pressure. It would have been wiser to have raised a foreign loan; this has too much the appearance of a 'benevolence' of our own old history.

From Kobe we are advised by telegram of the return of Mr. Groom to the Municipal Council by a large majority, which completely vindicates all that we have lately written upon Kobe and its foreign management.

From China the reports from the famine-desolated provinces are as bad as ever. There seems hardly any prospect of a crop this year the seed having been mostly eaten and the ground generally untilled. Matters are not quite so bad in Chihli, but there is great want of seed corn. The Government now proposes to raise a 'loan' from the wealthier people by means of bonds redeemable in ten years and bearing no interest. The authorities are fully in earnest and Mr. Forrest, H. M. Consul at Tientsin, state

that thousands of tons of food are now being sent into the famine districts. They are late: only one quarter of the original population now remain alive in Honan, Shansi and parts of Chihli. Half of the seventy-five per cent gone have emigrated to Mongolia and the South, dropping in thousands as they moved, of course,—the remainder died on the spot.

After several unsuccessful attempts, the P. & O. steamer China was raised from the bottom of Bombay harbour on the 15th May. She is found much injured and much time and money will have to be expended on her to make her seaworthy. Bombay harbour, we notice, is being put into a state of defence by means of torpedoes.

We are requested to notify to the public that postage on letters per French Mail to all Postal Union countries is reduced to 35 centimes per 15 grammes or fraction thereof, for pre-paid letters, and to 60 centimes for unpaid letters. Respecting the rates on letters for places outside of the Postal Union enquiry must be made at the Office.

THE JAPANESE PRESS.

ON THE CIRCULATION OF THE NEW TRADE DOLLAR.

(From the 'Hochi Shimbun'.)

PUBLIC Notice was given on the 27th ulto. by the Notification No. 12 of the *Daijokwan* (Council of State) to the effect that "the Silver Trade Dollars, which had hitherto been coined only for the convenience of Trade in the open ports, shall hereafter be free to circulate generally and therefore may be used in paying taxes and in all business transactions, either public or private." From careful consideration of this Notification and its causes, it would appear that the object of it is to sweep away the Mexican Dollar by means of the Silver Trade Dollar. That the Mexican Dollar has done injury to trade in our markets and has placed our merchants in a dangerous position, has long been well known to the public, and in consequence of the inconvenience in dealing with them, of having to calculate a double exchange, the damage sustained by trade is not small. As, however, the Mexican Dollar had the opportunity of entering the country at the opening of the ports, when there was no coin current here on which foreigners could rely, and has since gained ground, it has now become supreme in our markets. This chance of its being the first coin used, and since, long-established custom have put it in such a position that the people have gone on using it, in spite of its inconvenience, not having the courage to sweep it away, although it is generally detested. Indeed we may go so far as to say that it is the greatest obstruction to trade.

Our Government having, some time ago, remarked that the Mexican Dollar had acquired great power in our markets, and was the cause of great inconvenience, coined a silver piece to supplant it, which was named the 'Silver Trade Dollar.' It is 900 fine and its weight is 420 grains and if compared with the Mexican Dollar, which is also 900 fine, but only 416 grains, and which has lately deteriorated in quality, * ours is certainly a creditable coin. But alas! as the Silver Trade Dollar did not do the work of sweeping away the Mexican, the good intention of the Government was vain, to the great regret of merchants. The Government having put in execution the scheme of replacing the Mexican dollar by the Japanese trade dollar, could not bear to see its efforts fail and determined to persevere. Otherwise, it would have been better to have remained satisfied with the old system. But, to persist in carrying out its scheme, some contrivance was necessary to give the Trade Dollar an advantage over the Mexican which would enable it to push it out. Was not this idea the Government's motive in giving general circulation to the coin by Notification No. 12?

Though the area of circulation of the Mexican Dollar is very limited, since it cannot be received in payment of taxes,†

cannot circulate outside the foreign concessions, and is not in general circulation even in foreign countries; yet as it was the first coin used, and thus its position was assured,—the Trade Dollar, which appeared afterwards, has not been able to defeat it, because the area of circulation of the Trade Dollar being also limited to the open ports, it had no advantage over its rival. Though its quality was good, it did not differ much from that of the Mexican: and thus, as a matter of course, the first comer gets the victory over the later. But it may now be taken for granted that the Government, having given to the Trade Dollar the advantage of general circulation and thus the power of superseding the Mexican, has put it in a position to do so. Every one knows that the Mexican Dollar is an encumbrance on trade. Now it is to be swept away and every one will be glad of this. Should the scheme really succeed, it would certainly be a great advantage.

Such other revisions as have been made in the Note to Art. 4 of the Coinage Regulations; (respecting the limit of the amount of silver bullion receivable by the Mint for coinage), reducing the limit of bullion receivable from 1000 to 500 ounces; in Art. 9 (respecting the period to elapse between the receipt of bullion and delivery of coin), reducing the period from twenty days to ten; in Art. 11 (respecting the charge for coinage), reducing the charge from $1\frac{1}{2}$ per cent to 1 per cent; and in Art. 13 (respecting the charge for re-coining), reducing the charge from 10 per mil to 5 per mil;—these changes seem all directed to the end of extending the currency of our Silver Trade Dollar. But what financiers are uneasy about and doubtful of is lest Trade Dollars should not be coined in sufficient quantity to meet the requirements of trade, and thus, a scarcity of current coin being produced, it would be impossible for the Mexican to be pushed out by the Trade Dollar. And to these other questions also we are unable to reply:—would the Government, when the demand for the Silver Trade Dollar shall have increased, by virtue of these Regulations extending its currency—find no difficulty in meeting it? Would it be able to keep in the Mint a sufficient reserve of dollars always on hand to meet the possible demand for exchange against bar-silver? Would the coinage from bullion sent in by foreigners or from the interior be always sufficient to meet the requirements of trade without importation? Would the Mint be worked at a profit? and finally, will the Mexican Dollar thus be swept away? Of course, should this measure succeed, without causing any scarcity of coin, it must necessarily be praised as good.

But even should the numbers of Trade Dollars coined be insufficient to meet demand, still if,—on account of its better quality—it gets to be taken in preference to the Mexican and the area of its circulation is extended, this would in some measure lessen the power of the latter to create the extraordinary fluctuations which it now makes in our markets. That it has so much power, and creates such fluctuations, is due to its being the only coin current. But if our Trade Dollar is able to compete successfully with the Mexican, then, even though it may not be able to sweep it away entirely—still in proportion to the position it will assume with respect to the Mexican, it will decrease the power of the latter and more or less diminish the injury it causes. Such a victory would however only be temporary and must not be expected to be permanent.*

Some have jumped to the conclusion that this revision in the Regulations affecting the circulation of our Trade Dollar amounts to creating a double standard—of gold and silver. But the plain wording of the Revision Regulation is simply to the effect that

"These Silver Trade Dollars may be used in paying 'Customs' duties and any other taxes paid by foreigners; in all business transactions between Japanese and foreigners; also in payment of all taxes in the interior; and in all other payments public or private, the same shall be a legal tender to any amount."

We do not see any meaning expressed in this that the Silver Trade Dollar is given equal rank with gold coin or that the power of a standard is given to it.† The Revision

* The writer is in error: 417.69 is the average weight of the Mexican Dollar now, a figure at which we arrive from the weighing and comparison of many thousands. Why he should say that they have deteriorated in quality is not clear, but probably he refers to the recent change in the device, which was available only by Chinese shroffs to create another grade. Ed. J.T.

† The author should have excepted customs duties, which by treaty are payable in dollars as a substitute for the now non-existent silver *bas*. Ed. J.T.

* We presume the writer means that permanent good can only be achieved by the coin's suppression of the Mexican. Ed. J.T.

† It is not easy, on the other hand, to make any other meaning out of these words—or to conceive a more distinct definition of a standard coin. Ed. J.T.

of the Regulations has been made simply with the view of ousting the Mexican and to give the Silver Trade Dollar the power to do this. That is to say, to make the new Dollar serve as a Trade Dollar only, and to enable it to take the Mexican's place. Thus the object of the revision is not to make Gold and Silver of equal rank as standards,* but simply to sweep away the Mexican by means of the Trade Dollar. Those who conclude, from this special power having been given to the Trade Dollar, Gold and Silver are both made standards; can only be said to take a superficial view of the matter. The Silver Trade Dollar is only a piece having no fixed name or rank, and without a fixed name or rank, how can it acquire the position of a standard, or attain to the chief place? The conditions of its circulation will be just the same as the Mexican Dollar's. If it had been called a *Riyô* or *Yen* and thus had fixed name and rank, and had been made a coin of general circulation, then it might have been said to have acquired the position of a standard. But so long as it has no fixed name and rank, and its rate depends upon foreign influences, not only can it never take the chief place, but it must always stand in a secondary relative position to gold coin. Therefore the argument that Gold and Silver have now both acquired the position of standards is incorrect.

As transactions in the interior are generally made by means of paper money at present, even if the Trade Dollar had general circulation, it would not take the place of paper. How much less so, if the supply of Dollars is insufficient? *Even though the Silver Trade Dollar had acquired the power of general circulation, it would be unable to exercise that power at once. But the consequence of the inconvenience inflicted on trade by the Mexican Dollar will naturally assist the Trade Dollar to stand against it.* The power given to it is merely as a means of opposing the Mexican, and its qualification of general circulation will only tend to bring the coin all to one place (the *emporium* of foreign trade.)

Thus the Trade Dollar will not really circulate generally in the country, but will remain within the limits of the markets of foreign trade. If it did circulate generally, the endeavour to defeat the Mexican Dollar would not be successful, as a matter of course. But we believe that,—on account of the stimulus caused by the pressure of inconvenience arising from use of the Mexican, and the qualifications which fit the Trade Dollar to take its place, and also from the scarcity of supply of the Mexican,—in the markets of foreign trade the Trade Dollar will chiefly circulate. Such a scheme as defeating the Mexican Dollar by giving general currency to our own is a matter for rejoicing, but we are wishful at the same time that the country should be protected from the vicious system of a double standard of both Gold and Silver.

But the Mexican dollar at present standing alone in Oriental Markets, the amount of them in circulation is not small. If it be intended to replace them with our Silver Trade Dollars, the supply of them to be coined must necessarily be large. If, on account of our not having sufficient bullion to meet the demand, we cannot entirely succeed in our attempt, and have to leave the Mexican to remain in currency in our markets; then though the presence of the Trade Dollar may prevent any extraordinary fluctuations, this will only be for a time, and we cannot be sure that the Trade Dollar may not again be driven out by the Mexican. Consequently, if Government wishes to succeed in the attempt which it has announced its intention of making—in order to make the Trade Dollar serviceable to that end, it must be careful not to allow of any scarcity in the supply. Then it will secure for our coin a complete victory in the markets of foreign trade, sweep away the exorcism of the Mexican Dollar, which has for so many years been the cause of danger and inconvenience to our foreign commerce, and leave the East without a trace of its presence. But should it only be contemplated to place it in competition with the Mexican, though for a time it may succeed in diminishing the influence of the latter, the inconvenience and injury to trade caused will not be slight.

(From the *Nichi Nichi Shimbun*.)

BEFORE proceeding to argue on the advantages or disadvantages of having two standards of gold and silver, and also on changing from gold to silver, we must first consider the changes made in the standards up to the present time. A double standard of gold and silver coins has existed

* The object of the revisers may not have been this, but it is indubitably the effect of the revision. Ed. J.T.

for a long time in Japan, whereof a plain proof is found in the fact that there was no limit to the circulation of both gold and silver coins in the reigns of the Shôguns. When, shortly after the Restoration, Government decided to recoining all the money, and to establish a Mint in Osaka, though it was argued by some that Osaka was not a proper place, as it was believed then by the Government that Osaka, being in the centre of the country, with the harbour of Kobe close at hand, would unmistakably become some day the centre of trade, it decided on commencing the Mint at Osaka. But alas! the experience of seven years since that time having proved that the most flourishing point of trade is always in Tôkiô, the public have had cause to complain more and more of the inconvenience of the Mint having been established in Osaka instead of in Tôkiô. But the railway between Saikai (Kioto) and Kobe has, by the energy of the authorities, been built; and the Mail steamers, by the industry of the Mitsubishi Company, are constantly navigating to and fro; and thus the convenience of traffic by land and sea is, as time elapses, more and more facilitated. The time may come, therefore, after some years, when the authorities will be praised for their foresight in establishing the Mint at Osaka. We must therefore not jump to a conclusion now—as to the advantages or disadvantages of the situation, but wait until a future occasion. When the question of recoinage was being discussed, the authorities, regretted the innumerable injuries which would actually be inflicted, always, on markets from continuing to have the two standard coins of gold and silver of the Shôguns' reign and wished to fix one single standard. They, therefore, brought the question forward for discussion, and the then Manager of the branch office here of the Oriental Bank Corporation argued that silver coins being in circulation in China and India, making silver the standard would be found ultimately most convenient and profitable and most suitable for Japan; and his opinion being supported by the British Minister, some of our authorities concerned were, we heard, in favour of adopting it. But the commissioners who had been dispatched to England having heard it argued that silver was falling gradually out of favour as a standard in the mercantile world, thought that the best policy for Japan to secure her future prosperity would be at once to fix the standard coin in gold, so as to avoid suffering from the same inconvenience as that experienced in the Oriental silver-using countries; and those commissioners who were dispatched to America being convinced that, unless gold be made the standard here, not only would it be unprofitable for us to trade with Europe and America, but also would be opposed to general uniformity, and would finally be a cause of loss;—therefore these thought that it would be better, in accordance with the decision of the International Conference on Coinage held in Paris in 1867, 1st to make gold the standard; 2ndly, to fix the fineness of the gold coin at 900 per 1,000; and 3rdly, to fix the weights by the metric system; thus advancing ahead of Europe and America in the question of International current coin. The Government approved this as decidedly the right course, and in consequence, notified the New Coinage Regulations in 1871 and settled the weight of pure gold in the 5 *yen* piece to be 7½ *grammes* (that in the 1 *yen* piece to be 1½ *gramme* and that in the 20 *yen* to be 30) and so hoped that when Europe and America should have adopted the International current coinage system, Japan would have the convenience of her 5 *yen* coin being of the same weight and quality as a 5 dollar piece of America, an English sovereign, 25 franc piece of France and 20 mark piece of Germany. But though then, advocates of the International coinage system abroad constantly praised Japan that, so young a country, she should be the first to adopt this grand system and argued that all the world would soon follow her example in adopting it; yet we observe that, actually, each State adopts what itself considers best, and up to the present time the International coinage system exists only in theory; and, with the exception of our own country, it is actually adopted neither in America or Europe.

Although as above shown, a single standard of gold coin was actually adopted and silver coins of and under 50 *sen* were decided, in 1871, to be subsidiary coins, yet in the markets of foreign trade, business was actually and unchangeably done with the Mexican Dollar—and, compelled by the plain wording of the Treaty, and by the force of long-continued habit, it was not possible at once to abandon the use of Mexican Dollars in paying Customs' duties and in business transactions generally. On the other hand, the Mexican Dollar,

not having been in the least deprived of its power by the gold coin being made the standard, in order to sweep away the Mexican Dollar from the markets, Government then coined the *silver yen* piece of 416 grains, and made it circulate within the limits of the open ports. From that time, in reality, gold and silver were both in the position of standard coins. But, on account of the one *yen* silver coin being lighter in weight than the Mexican Dollar and not as yet being thought reliable in China, the Government, suffering more or less difficulty as the price of silver fluctuated, and foreseeing more, before it could accomplish its object of sweeping away the Mexican Dollar—took, a few years after, the opportunity of an accident, to cease coining the silver one *yen* coin, and returned to the single standard of gold, thus allowing the Mexican Dollar to usurp more and more power in the markets.

Then, in America, a trade dollar having been coined, and it being intended to export it to other countries in opposition to the Mexican Dollar, our country also took the same course, coined a Trade Dollar of 420 grains, and circulated this in lieu of the silver *yen*, thus again actually adopting a double standard of gold and silver, and so we have gone on until the present day. Now, fortunately, there being no proper and reliable silver coin in China and India, our Government, wishing to extend the area of circulation of our Silver Trade Dollars by seizing this opportunity—which will also enable us to sweep away the Mexican Dollar here, has in the recent Notification, we believe meant to notify the making of this silver coin standard. And though, in fact, from 1871 to the 27th of May 1878 nominally the gold coin was the only standard coin, in reality neither gold and silver has ever entirely abdicated the position of standard coins.

(From the 'Chingai Bakka Shimpō'.)

IN No 97 of this paper, we expressed a portion of our views on the Notification No 12 authorizing a change in the currency of the Silver Trade Dollar but the editor of that valuable paper, the *Hōchi Shimbun*, has argued the whole subject carefully and completely. His idea that the object of the change (in the Notification) is to sweep away the Mexican dollar, agrees with our own view, and we are obliged for his having expressed so far our views better than we could have done ourselves. However, in the latter part of his article he states reasons for not considering gold and silver now as both being standards, and thus indirectly attacks what we had previously written on the subject. On this one point, as we greatly differ from him, we now write again, to support our previous arguments, as a reply to the editor of the *Hōchi Shimbun*, and also for public information. The editor of the *Hōchi* says:—

"Some have jumped to the conclusion that this revision in the Regulations affecting the circulation of our Trade Dollar amounts to creating a double standard—of gold and silver. But the plain wording of the Revision Regulation is simply to the effect that

'These Silver Trade Dollars may be used in paying Customs' duties and any other taxes paid by foreigners; in all business transactions between Japanese and foreigners; also in payment of all taxes in the interior; and in all other payments, public or private, the same shall be a legal tender to any amount' and he goes on to say:—

"We do not see any meaning expressed in this that the 'Silver Trade Dollar is given equal rank with gold coin or that the power of a standard is given to it. The Revision of the Regulations has been made simply with the view of ousting the Mexican and to give the Silver Trade Dollar the power to do this. That is to say, to make the New Dollar serve as a Trade Dollar only, and to enable it to take the Mexican's place. Thus the object of the revision is not to make Gold and Silver of equal rank as standards, but simply to sweep away the Mexican by means of the Trade Dollar. . . . The Silver Trade Dollar is only a piece having no fixed name and rank, and without a fixed name and rank, how can it acquire the position of a standard, or attain to the chief place? &c. &c."

These are the principal points where our previous argument is attacked. But how is it, that the Editor of the *Hōchi*, whilst carefully publishing in full the paragraph quoted from the Notification, cannot see that the meaning of it is to give the Silver Trade Dollar the power of a standard and equal rank with gold coin? If they may be used in paying the Customs' duties, and any other taxes paid by

foreigners; and in all business transactions between natives and foreigners; also in payment of all taxes in the interior, and in all other payments, public or private; and is a legal tender to any amount—there are no other services besides these which gold or paper can render; and we, on the contrary, cannot discover any meaning in the paragraph which makes against their being constituted standard coin.

His point that they 'have no fixed name or fixed rank' is simply a question of their title, and—the general title of coins in our country being *yen*, one Silver Trade Dollar coin is counted in transactions as one *yen*. This is what actually takes place, and though simply in a legal point of view, it might necessitate a Governmental Notification to authorize this, it is not to be presumed from this point only that the Silver Trade Dollar is not a standard coin. And we maintain that the object of the change is not merely to sweep away the Mexican Dollar by means of the Silver Trade Dollar, but also—it is apparent, to make the latter a standard, and to have two standards—of gold and silver. The policy of the Government being that—recognizing Silver to be indispensable in Oriental Countries, the standard coin should be decidedly fixed to be really Silver;—yet leaving, however, the Gold nominally so. But actually the silver coin will be the only standard. That paper money is in circulation has arisen from unavoidable circumstances of a temporary nature; but the system is certainly not unchangeable, and we presume that, so soon as the Government finances shall have been restored, in time the paper money will all be changed for coin, and our country will use silver alone. This is the point where we differ from the editor of the *Hōchi*.

Disregarding, however, this difference in our views; as we are of course at one with him as regards getting rid of the Mexican Dollar by means of Silver Trade Dollars, we must exercise our best and utmost efforts to study and explain the means of doing this. Our first effort should be directed to helping the Silver Trade Dollar to gain a footing in the open ports of Japan and China (*i. e.* to make it a standard coin, and to allow its employment in all business transactions and payments of taxes &c. by natives and foreigners). This has now already been done. The second effort to make—which would give a greater power in the same direction to our Dollar, is to prohibit the employment of the Mexican Dollar for payment of Customs' Duties. Originally, the Customs' Duties had to be paid with silver *Ichibus*, but since they were replaced by the Mexican Dollars, at the rate of \$100 for 311 silver *bus*, the loss sustained by the Government has indeed been immense; but as the treaty is in existence, it cannot be helped, and time passed on without anything being done to remedy this. But *ichibus* having gradually been melted, have become so scarce that we do not see one now, whilst the Mexican Dollars which took their place, have gained more and more power, and these are mostly employed now (for payment of Customs' duties.) However, when the Silver Trade Dollars are cheaper than the Mexicans, the former are used. Now if we should decide not to take the Mexican Dollar for Customs' duties, they would finally become coin of no general circulation.

So long, too, as there is no reliable coin in the country, foreign Governments too must unavoidably employ the Mexican Dollars, however unreliable they may be. But our silver dollar is actually 900 grains fine, and 420 grains in weight and indeed is worth about one per cent more in intrinsic value than the Mexican; and further, the Mint which coins them is close at hand. There are, however, some among the foreigners who—because our Mint is not still entrusted to foreign direction, doubt and grumble, suspecting that the coining may not always be done properly, that the fineness may not be kept up, or that the weight may be decreased. But we cannot at all understand why they should not believe so much, and trust in our Mint—*i. e.* in our Government;—*i. e.* in our Country of Japan. For what reason to they rely on the Mexican dollar? What guarantee does the Mexican Government give? We would ask them:—Since our country has been opened to trade with foreign countries, have we ever broken our promises of paying money—either of indemnities, loans or the interest on loans? There has never been any such case. And therefore the bonds of our loans, unlike those of other foreign countries, are always fixed to the London market and maintain a high price. And in our Mint are not a certain number of coins taken out of those coined every day, and tested once a year? And also, are not some of them sent to the Mints of England and America to be tested, and the result notified to the public,

so as to prove their correctness? If these precautions are not to be relied on, what can be relied on? We are therefore of opinion, that the second important step should be taken (i.e. refusing the Mexican Dollar at the Custom house) the power of the Silver Trade Dollar thus extended, and that exorcism, the Mexican Dollar, be so swept away that a trace of it should not be found in the country.

THE BEAUTIFUL MAIDEN OF PAO.

A TALE FROM THE HISTORY OF CHINA IN THE 8TH CENTURY BEFORE CHRIST.

TRANSLATED FROM THE CHINESE BY C. ARENDT.

FORMING A SUPPLEMENT TO THE PROCEEDINGS OF THE GERMAN ASIATIC SOCIETY.

Prefatory Remark of the German Translator.

THE "History of the Principalities at the time of the Eastern Chou (Chinese: *Tung-chou-lié-Kuo*), of which the first three chapters are here given in full translation, belongs to that extensive class of works in Chinese literature, which the Chinese themselves call *Ye-shi* i.e. "Savage history." This great class may be divided into

a. History embellished by Romance.

b. Historical romances, that is, imaginative tales with historical backgrounds.

Mr. W. F. Meyers deserves our thanks for an enumeration (somewhat dry; and it seems to me, too condemnatory) of the Chinese works belonging to both these classes which he has given in the Notes and Queries on China and Japan, edited by N. B. Dennys, Hongkong 1867. Vol. I p.p. 24-26, 102-104, 119-121.

The work from which the following translation is taken, like the *San-Kuo-Chih* (History of the three Kingdoms), belongs to class A, while the *Shin-hu-Chuan* may be taken as the leading representative of historical romances (Class B).

We are inclined to assign to the "History of the Principalities at the time of the Eastern Chou" (mentioned very cursorily by Meyers) a very high place in Chinese literature. The occurrences of five and a half centuries (from the 1st half of the 8th to the second half of the 3rd century before Christ) are there presented to us in accurate connection with historical tradition, while the lively tone of the story, and the happy arrangement of the matter, constantly animate the interest of the reader. It is true, however, that tediousness and length are not absent, as for instance in the very first chapter where the unæsthetic episode of the dragon's saliva, is related at considerable length.

The first three chapters of the "History of the Principalities," which form the introduction to the whole work, seem especially suited for translation, because they form by themselves a complete and separate whole.

I shall now leave the author, whose name is unknown, to speak for himself.

CHAPTER I. THE EMPEROR HSUAN.

The Chou dynasty (1) commenced when Wu-Wang conquered the Chou (2), and ascended the throne of the Son of Heaven. Wu-Wang was succeeded by the Emperors Ch'eng and Kong (3), both of whom were excellent rulers who knew how to govern the country according to the desire of the founder of the dynasty. Moreover, the Dukes of Chou, Sha, Pi, Shih-I and others showed themselves skilful advisers of the throne, and most loyally assisted the Emperor to govern. This was a time, when the land had rest from the horrors of war; the arts of peace flourished; the country was rich and the people happy.

During the reign of the Eighth Emperor of the I.

(1) The Chou dynasty reigned from 1134 to 255 before Christ.

(2) Chou was the last Emperor of the Shang or Yin dynasty. Wu-wang, (or the Emperor Wu), the first Chou Emperor, reigned from 1134 to 1115 before Christ.

(3) Ch'eng-Wang 1115-1078 B. Ch. Kong-Wang 1078-1062.

wang (4) dynasty, the central Government began to lose its power; the Chuh-ou (5), became more insolent, and did not present themselves regularly at the audiences. The ninth Emperor, Li-wang (6) was cruel and devoid of principle. He was murdered by the people, and from this occurrence dates the commencement of anarchy in the land. Fortunately the united endeavours of the Dukes of Chou and Shao, succeeded in placing Prince Ching, the Son of Li-wang, on the throne. He is known in history as Hsüan-wang (7). Here again was a man who knew how to conduct the Government with knowledge and skill. Among the able men whom he placed in high offices, we will only mention Fang-shu, Shao-liu; Yin-chi-fu; Shên-po and Chung-shang-fu. The times of the Emperors Wên (8), Wu, Chêng, and Kang seemed to come again, and the tarnished lustre of the house of Chou was restored. The following well known verse refers to this:

"The Government was powerless under the Emperors I and Li; but Hsüan placed rigorous men in office and restored order. If Kung-h'o had not been succeeded by a ruler who renewed the lustre of the Dynasty, the house of Chou could never have held the throne for eight hundred years." (9)

Although, as we have already said, the Emperor Hsüan was a rigorous ruler, yet he did not equal the Emperor Wu, who followed implicitly the precepts of the "Red book," and the maxims which he ordered to be inscribed on doors and windows (10); And although we have said that he restored the splendour of the Empire, yet he could not do it like the Emperors Ch'eng and Kang, in whose time the authority of the Imperial House was so great, that nobles from the most distant countries came with tribute to the court.

In the 39th year of the reign of the Emperor Hsüan the Chiang-Jung (11) rebelled, and the Emperor took the field against them in person. He suffered, however, a severe defeat at Ch'ien-mu, and many soldiers, both horse and foot, remained on the battle field. The Emperor now thought of undertaking a second campaign against the enemy; but, fearing that the number of his force was not sufficient he prepared to take a census of his people at Ta'i-yüan. This Ta'i-yüan—the present district of Ku-yüan-chou, lay quite near to the Jung and Ti (12). The object of a census is to make an exact register of families and the members of families, in order to raise war-taxes, recruit soldiers, and be able to take the field in a force proportioned to the number of the population, and to the amount of grain and straw in the Empire. The Prime Minister, Chung-an-fu, remonstrated with the Emperor on the danger of this measure, but was not listened to. The following verse refers to this incident:

"Why, O Emperor, must thou pollute thy sword in battle against dogs and swine? (13) It is in truth a pity to shoot at birds with pearls (14). The authority of the ruler is gone, and it is impossible to take revenge! Thou numberest the people in vain."

When the numbering of the people at Ta'i-yüan was finished, Hsüan-wang turned on his road home-wards, and

(4) The Emperor I reigned from 884-878 B. Ch.

(5) The Chuh'ou were Kings, Dukes and Chiefs who were the chief among the many principalities into which China was then divided. The word could be best translated by "Feudal or tributary Princes."

(6) Emperor Li reigned from 878-827 B. Ch.

(7) 827-782 B. Ch.

(8) Wên, or Wen-Wang was the father of Wu-Wang the founder of the Chou dynasty.

(9) When Li, the father of Hsüan-wang, was deprived of his throne, and had fled to Chih, the Dukes of Chou and Shao carried on the government. The period of their administration is called in history Kung-h'o, "the harmonious double government."

(10) The "Red Book" (Chinese *tan-shu*) was a kind of mirror for Princes. The Emperor Wu had all the wise maxims which it contained on the art of government written on all the doors, mats, tables, girdles, shoes, boots, plates, washing-basins, winecups and dishes in his palace, so that he should constantly act according to them.

(11) The Chiang-Jung, also called Jung, was a horde of barbarians on the Western-frontier of the China of those days. The 39 year of Hsüan-Wang=789 B. Ch.

(12) Jung. The Barbarians of the West.

Ti. The Barbarians of the North.

(13) "Dogs and Swine." The barbarians.

(14) "Pearls." The weapons of the Imperial Army. "Birds." The barbarians.

as he approached the capital H'ao-ching, (15) he hastened on, and continued his journey day and night. Now, as he entered H'ao-ching, he noticed in the street a crowd of thirty or forty lads who clapped their hands and sang in chorus. Hsüan-wang ordered the carriage to stop, and listened. The words of the song were :

The moon is rising,
The Sun sinks down.
The bows of Yen
And the quivers of Chi
Threaten ruin, alas !
To the House of Ch'ou.

Hsüan-wang was very angry at these words and ordered the coachman to have the boys arrested and brought before him. Meantime, however, the boys grew frightened and ran away in various directions, so that only two, an elder and younger one, could be caught. These knelt down before the Imperial carriage, and Hsüan-wang asked :

"Who composed this song?"

The smaller of the two could not speak a word for terror, but the elder one said :

"The song did not originate in our district. Three days ago a boy dressed in red clothes, came on the market place and brought us those six lines. And since then it has gone the round of the whole town, and all the boys sing it in every street and lane as if by a concerted arrangement."

Hsüan-wang asked :

"Then where is the boy in red clothes now?"

The lad replied :

"After he taught us the song, no one knows where he went to."

The Emperor was silent for some time and then, in a very ungracious manner, allowed the two boys to depart; but he called the chief of the Police, and commanded him to issue a stringent order to the following effect. "If any boy is again found singing this song, not only the offender, but also his father and his elder brothers will suffer the same punishment."

The same evening the Emperor returned to his palace. The following morning, at the early audience, the three privy councillors and all the six ministers placed themselves on the steps of the throne. At the conclusion of the greeting, the Emperor related to the assembled dignitaries a detailed account of the song of the boys on the previous evening, and inquired what it could mean. The Minister of Religion and ceremonies, Shao-h'u, answered :

"Yen is the name of a sort of wild mulberry tree which grows in the mountains and of which bows are made; that is the meaning of the words 'The bows of Yen.' Chi is the name of a plant from which quivers are made and this is the meaning of the words. 'The quivers of Chi.' In my poor opinion, misfortune is impending over the land from bows and arrows."

The Prime Minister and Minister of the Interior, Chung-shan-fu, then dexterously said :

"Bows and arrows are the instruments of war. Your Majesty has lately numbered the people in Tai-yüan with the object of taking revenge on the hordes of Jung. If in consequence of this, we have an endless war, the ruin of the country will be the necessary result."

The Emperor did not reply to this in words, but he nodded his head affirmatively, and then inquired anew :

"The song was circulated by a boy clothed in red who can this lad be?"

"If," replied the Imperial Astrologer Po-yang-fu, "a word, the origin of which cannot be discovered, is spread abroad through streets and lanes, it is called a prophetic word of the people. Heaven, in order to warn the ruler of men, has now ordered the Yung-h'uo-hsing (16) to change itself into a little boy, in order to convey this prophecy to the crowd of lads. Such prophetic words from the mouths of children may, according to circumstances, foretell the happiness or misfortune of a single creature, or the rise or decay of an Empire. The Yung-h'uo is a star of fire; hence the red colour of the cloth-

(15) H'ao-ching or Kao-ching, the then capital, was in the present Shensi, in the Hsi-an-fu district.

(16) Yung-h'uo-hsing, the name of a star (Hsing=a star) Mars, I believe.

ing. The prophecy of the threatened ruin of the dynasty, is a warning from Heaven to the Emperor."

Hsüan than said :

"Very good ! I will pardon the Chiang-Jung, (17) and will send the warriors at Tai-yüan back to their homes; the bows and arrows stored in my arsenals shall be burned, and the construction of these weapons prohibited throughout the whole Empire. Tell me, astrologer, can the threatened danger be averted in this manner?"

Po-yang-fu answered and said :

"I have enquired of the Heavenly signs, the Horoscope is cast; and it seems that all this points to one occurrence, which is prepared in the palace, and not to any other circumstance. The story of the bows and arrows refers to some misfortune which will be caused by a future Empress. The prophecy says :

"The moon rises

"The sun sinks down.

"The sun represents the ruler of men; the moon belongs to the female element. "The moon rises, the Sun sinks down," means that the female principle gains the mastery, and the male must give way; and it is clear that an Empress will bring misfortune on the land."

Hsüan-wang again spoke :

"As regards my own six seraglios, I have always been able to rely on the virtue of my consort, the Empress Chiang. Among all the ladies of my palace she has always been most circumspect. A misfortune caused by one of my wives is not to be thought of."

To-Yang-Fu replied :

"Although the prophecy says "the Moon rises, the Sun declines," it does not say exactly, that the occurrence must take place at once; moreover, it speaks of a threatened danger, not of one which must inevitably take place. By a strict exercise of virtue the misfortune can not only be averted, but be changed into a blessing. It is not at all necessary to burn the bows and arrows."

When the Emperor heard this, he wavered between doubt and belief; he was irritated, and breaking up the council he arose and returned to the palace. The Empress Chiang met him there, and they sat down together. He then informed her exactly of all that the high dignitaries had said, whereupon the Empress said :

"Something extraordinary has happened in the palace, which I was just going to communicate to you." What was that?" enquired the Emperor. "In the Seraglio" replied Chang H'ou (18), "there is an old maid servant who has lived here since the time of the late prince, and who is more than fifty years of age. Since the reign of the last Emperor she has been in a state of pregnancy, and now, forty years after conception, last night she brought a girl into the world."

The Emperor was much startled at this and enquired where the new-born child was. "I thought it was a child of misfortune" replied the Empress, and therefore I ordered it to be wrapped up in straw matting, and to be thrown into the river Ching-Shiu (19), twenty li away from here."

The Emperor had the old maid servant brought before him immediately, and questioned her about her pregnancy. She knelt down and spoke as follows :

"I have heard it said that in the last year of the reign of the Emperor Hsia-Chieh (20), two men of divine origin from Tao-cheng changed into two dragons, and took up their abode in the court of the Imperial city. Saliva flowed from their mouths. Suddenly they spoke like human beings, and said to the Emperor Chieh : "We are two princes of Pao-ch'eng (12). The Emperor feared them much and desired to have them killed. He first ordered the Imperial Astrologer to prognosticate the result, and as this did not turn out favourably, he thought of hunting them away. The inquiries of the Astrologer were again unfavourable, and the latter said to the Emperor : "The descent to earth

(17) See notes 11 and 12.

(18) H'ou means Empress.

(19) The river "Ching-shiu" i.e. clearwater-river.

(20) Hsia-Chieh, i.e. Chieh, the last Emperor of the Hsia dynasty, reigned 1818-1767 B. C.

(21) Pao-ch'eng, i.e. the town of Pao.

(22) The Commentator Tsai-yuan-ying-fang, makes the following brief comment on this interpretation of the Astrologer : "Nonsense."

of men of divine origin betokens fortune. (22). Your Majesty should catch some of the divine saliva of the dragons and preserve it; for the saliva is the essence of their lives and the preservation of it must bring us luck (23). The Emperor then ordered the astrologer to prognosticate the result of this, and it was found to be especially favourable (24). Consequently a silk cloth was placed before the dragons, and an offering was made to them. A golden plate was brought into which their saliva was put, and the plate was then locked up in a red box. A strong wind suddenly rose, heavy rain fell, and the two dragons fled from thence . . . But the box was placed in the Imperial treasury.

"Six hundred and forty years and twenty-eight rulers passed away under the Yin dynasty (25); and it is nearly three hundred years since the noble house of Chou ascended the throne. During the whole of this time the box was never opened. In the last year of the reign of your Majesty's father, a bright light streamed from it. The overseer of the treasury informed the late Emperor of this circumstance, and the latter enquired what the box contained. The overseer produced the old books and records and in them was found the whole history of the dragon's saliva. The Emperor ordered the box to be opened."

One of the chamberlains opened the golden chests, took out the plate of gold, and handed it to the Emperor; the latter however, carelessly let it fall to the ground, and the saliva which it contained flowed out on the floor, and was immediately transformed into a small turtle which ran round on the floor. The chamberlain tried to catch it, but it ran into the Emperor's closet, and there disappeared, leaving no traces. I was then just twelve years of age and I had no sooner stepped accidentally on the place where the turtle had run round, and where the marks of his feet still remained, than I felt an extraordinary elevation of spirits; and from that moment my body began to increase in size as if I were with child. The late Emperor was angry that I, who had no husband, should be pregnant and shut me up in a solitary chamber. That is now forty years ago; and last night the pains of childbirth coming on, I was delivered of a girl; the servants of the seraglio did not dare to conceal the affair, but told the Sublime Mother. (26) She said that it was quite impossible to allow a child begotten in such a manner to remain here, and ordered the servants to throw it into the river. I know well such a wretch as I, deserves death ten thousand times.

"But that is all a story of previous dynasties," cried the Emperor, "and what have you to do with it?" He sent the old woman away with harsh words, and ordered the servants to go to the river "Clearwater" and see what had become of the child. They returned soon afterwards and informed him that it had floated away some time previously.

Hsuan-wang did not doubt the correctness of this report: but the following morning at early audience he called the Imperial Astrologer Po-yang-fu to him, and having told him the story of the dragon's saliva, he said: "The child has probably met its death in the water, but please consult your mystical symbols, and inform me whether the spell is broken."

Po-yang-fu immediately consulted the fates, and told the king the result. The prophecy was as follows:

Tears and Laughter!
Laughter and Tears!
A lamb devoured by ghouls!
A horse pursued by dogs!
Beware, Beware
Of the Quivers of Chi! (27)

(23) "The Astrologer talks the most frightful nonsense; I could laugh at it, only that I can't help being vexed at it," says the Commentator at this place.

(24) "That the prognostication was favourable this time, was of course, only a lie of the Astrologer," remarks the Commentator.

(25) The Hsia dynasty, of which Chieh was the last Emperor, was followed by the Yin or Shang dynasty, and this by the Chou dynasty.

(26) "The Sublime mother" (Niang-niang) i.e. the Empress.

(27) The commentator Tsai is very pleased with this prophecy of Po-yang-fu. He says "This prophecy is excellent. The Imperial Astrologer need not be ashamed of it."

It may be remarked *passim* that the tradition of the dragon's saliva is contained in the earliest historical works.

This was quite incomprehensible to the Emperor; but Po-yang-fu said:

"According to the twelve Wen, the lamb is Wei, the horse Wu. Tears and laughter are the marks of sorrow and gladness. The fulfillment must occur in a Wu and a Wei year (28). My opinion is that the enchantment, although turned away from the palace, is not yet destroyed."

The Emperor was much relieved at hearing this and immediately issued an order that both within and without the town a search should be made from house to house for the child; and that if any one brought it dead or alive, he should receive a reward of two hundred pieces of silk. But if any one took it in and nourished it, the first who gave information thereof, was to receive a similar reward, while the offender and his whole family would be executed. The Chief Councillor of state, Ta-po, was ordered to see to the execution of this command. Furthermore as the prophecy mentioned the "bows of Yen" and "the quivers of Chi," the Vice Councillor of State Tso-ju received instructions, with the assistance of the police, to take care that no bows made from the wood of the wild mulberry tree, or no quivers made from the Chi should be offered for sale in the markets or shops; offences against this command were also to be visited with death.

The police did not dare to show the slightest negligence and a number of officials were sent out to make the order known, and to arrest any offenders against it. The inhabitants of the town naturally did not venture to act contrary to the order; but in the interior it was not yet generally known. The following day as the search was going on, lo! there came a woman with quivers made from the Chi plant in her arms, followed immediately by a man who carried more than ten bows on his back. They were a married couple who lived far away in the interior and they were going to market to sell their wares. But just as they reached the gate of the town, they ran directly into the arms of the police and were stopped. One of the latter first seized the woman; and her husband when he saw that something was wrong, threw down his bows of mulberry wood, and fled from the place. The police put the woman in fetters and having collected the quivers and bows, brought them to the Councillor of State. Tso-ju reflected that the objects which had been seized corresponded exactly with the words of the song; moreover the Imperial Astrologer had said that misfortune would be caused by a woman; that woman is now found and therefore the command of the Emperor may now be regarded as cancelled. He then made a report to the Emperor in which he made no mention of the man, saying only that a woman had sold the forbidden articles and according to the law deserved

(28) It is well known that the Chinese have a cycle of sixty years. Each of these sixty years has a special name, which is formed by placing together one of the so called "Heavenly boughs" with one of the "Earthly branches." There are ten of the former and twelve of the latter.

The ten Heavenly boughs are
chia, i, ping, ting, mao, chi, keng, hsin, jen, kuei.

The twelve Earthly branches.

(or as they are here called "the 12 Wen,") are:

tsze, chou, yin, mao, ch'en, sze, wu, wei, shen, yu, hsi, h'ai.

The ten boughs are then placed side by side in a row with the branches, and when either is finished, it is commenced over again, thus:

CHIA-tsze, i-ch'on &c. &c. CHIA-hsi-i-h'ai ping-TSZE &c. CHIA-shen &c.

Hence the first heavenly bough *Chia* occurs every eleventh, and the first earthly branch *tsze* every thirteenth year; the sixty-first year is again a *Chia-tsze* year and the new cycle begins.

Moreover each of the twelve earth branches (or Wen) belongs to a certain animal, thus:

Tsze	to the Rat
Ch'ou	Ox
Yin	Tiger
Mao	Hare
Ch'en	Dragon
Sze	Serpent
Wu	Horse
Wei	Lamb
Shen	Monkey
Yu	Hen
Hsi	Dog
H'ai	Boar

Now as the prophecy mentions the lamb and the horse, it means that misfortune will occur in years in which the earthly branches *Wu* and *Wei* occur.

death. Hsüan-wang ordered her execution, and the burning of the bows and quivers in the public market place as a warning to the people. A poem of a subsequent period refers to this:

"Instead of averting the punishment of Heaven by governing virtuously, thou hast foolishly accepted the letter of the popular song, and hast killed a poor woman. Tell me not of the many rigorous Councillors of the Emperor Hsüan. Why was there no true servant at this exact time to warn his ruler."

But we must not forget the man who sold the bows of mulberry wood. After he had fled, as already related, he reflected on the reasons why the officials desired to arrest himself and his wife; and determined first of all to discover the fate of his wife. Night brought him to the outside of his own village; and on the following morning he heard the people telling each other that on the previous day, a woman who sold bows of mulberry wood and quivers of *Chi*, at the Northern Gate, against the decree, was arrested and immediately executed. He knew then that his wife was no longer alive, and when he came to a still, lonely spot he dropped tears of sorrow, but rejoiced at the same time that he himself had escaped death. He went on anywhere that chance would lead him for about ten *li* or more, and came to the banks of the river "Clearwater." Here he saw a large flight of birds in the distance which flew about shrieking. As he approached them, behold! a bundle wrapped in matting floated on the surface of the water, which the birds pulled with their beaks, screaming all the time, and at last drew it quite near to the bank. The man could not withhold an exclamation of astonishment. He drove away the birds, and drew the dripping bundle out of the water, and took it to a high part of the bank which was overgrown with grass. He opened it and looked inside; moaning and crying fell upon his ears, and lo! there was a little girl inside. The man said to himself. "Who can have thrown the child into the river? But as the birds drew it through the water with their beaks, it is quite clear that she is no ordinary child. I will take her with me and bring her up; when she is once grown we shall see!" He took off his mantle and wrapping the child in it, betook himself after some reflection, as to where he could fly, to Pao-chêng (29) where he had some good friends. But "the old man with the beard" (30) has sung of the wonderful delivery of this child in a special poem in which he says:

"The child was forty years in her mother's womb and three days in the water. She lived and grew and the evil spell extended itself farther. The mysterious power of fate is not to be averted by the wisdom of Princes."

After the execution of the woman who sold the bows and arrows the Emperor Hsüan believed that the children's prophecy was already fulfilled. He therefore felt his mind completely at ease, and nothing more was said of campaigns against the Jung.

I have nothing to relate of the following year and we now pass on to the 43rd year of the Emperor (i.e. 785 B.C.)

It was the time when the "great sacrifice" should be made in the Ancestors' temple. The Emperor passed the previous night in the Sacristy (31). The water clock pointed to the second watch (32). Not a sound disturbed the deep stillness. Suddenly he saw a beautiful woman approaching from the West, and entering the temple door. The Emperor was annoyed that she dared to disturb his devotional exercises, and addressed her in very harsh terms. He called loudly for his attendants to come in, and seize the woman, but no one appeared to answer his call. The woman, without exhibiting the slightest sign of fear, went directly into the Ancestors' temple, laughed loudly three times, then wept in the same way three times, and taking down the memorial tablets of the dead Emperors (33)

(29) He went to Pao-chêng the very town from which came the divine beings who had been changed into Dragons.

(30) The poet Su-tung-pô who lived under the Sung dynasty was known by this name.

(31) In Chinese "In-chai-kung," that is in those portions of the temple which were set apart for fasts and other ascetic exercises.

(32) That is between 10 and 12 o'clock at night.

(33) These are long wooden tablets with the name of the deceased, which are the chief objects of veneration in all Chinese Ancestral Temples.

from their places, and wrapping them in a bundle, went away in an easterly direction. The Emperor arose to follow her, and then he woke suddenly. It was all only a dream.

Exceedingly troubled in mind, the Emperor went into the temple and performed the ceremonies. After the nine-fold contribution of wine was completed, he returned to the Sacristy, changed his dress, and sent servants out to call the Imperial Astrologer Po-yang-fu to a private audience. To the latter he related his whole dream, whereupon Po-yang-fu said:

"Has Your Majesty then forgotten the words of the children's song which was circulated three years ago? I said then already, that the words referred to misfortune through a woman, and the spell is not yet broken. In my prophecy laughter and tears were also mentioned. Your Majesty's dream coincides only too closely with all these."

"But is not the death of the woman who was then killed sufficient," cried Hsüan Wang, "to make the prophecy relative to the bows of Yen and the quivers of Chi of no effect?"

"The ways of Providence," said To-yang-fu, "are mysterious; it is only when the time is come that man can recognise and understand them. What has the death of a poor woman from the country to do with the dispensations of fate?"

The Emperor fell into deep thought and was silent. Suddenly he remembered that three years ago he had given an order to the Chief Councillor of State, Tu-po, to discover with the help of the police the infant which had been thrown into the water.

After the conclusion of the sacrificial meal, the Emperor returned to his palace, and when all the dignitaries appeared to express their thanks for his hospitality (34), he called Tu-po and inquired how it was that no information had yet been brought to him, respecting the infant which had been thrown in the water.

Tu-po answered:

"My search for the child led at that time to no result, and after the woman was executed and the words of the children's song were fulfilled, I believed that I might discontinue the search, all the more that I feared it would be without result, and that persistence in it might cause disquietude in the country."

"In that case," said the Emperor in great anger, you should, at least, have given me information as to the proceedings which you took. That you have not done so is a contempt of my express instructions and an unheard-of disobedience. I cannot have such a faithless servant in my palace."

He immediately ordered the palace officials to lead Tu-po out, and execute him before the gate of the palace as a public warning. The assembled dignitaries were horror-stricken; (35) and a person stepped forward from the crowd, held Tu-po firmly and called out: Impossible! Impossible!

Hsüan-wang looked at this individual, and lo! it was none other than the Vice-Councillor of state, Tso-ju. This Tso-ju was a friend of Tu-po's and owed his high office at Court to the recommendation of the latter.

Tso-ju immediately threw himself on the earth, before the Emperor, and said:

"I have heard it said that in the time of the Emperor Yao, (36) an inundation which lasted for nine years occurred, but the Imperial throne did not totter. I have also heard that in the time of the Emperor Tang there was a drought which lasted for seven years, but the prince's authority suffered nought thereby. What is the meaning then of all this discussion about the dispensations of fate? What great thing can occur by means of this child? If you slay Tu-po, the news of the apparition will only be spread abroad throughout the land. Even the barbarians on the boundaries of the Empire, when they hear of it, will despise and scorn us. I implore you to pardon him!"

(34) After the sacrifice the Emperor divides the slain animal with his high officers.

(35) In Chinese "Their faces with fear became the colour of clay."

(36) Is said to have governed 2356-2258 B. C.

"Do you dare," cried the Emperor, "to defy my order for the sake of your friend. He is more to you than your Sovereign!"

"If the Sovereign was right, and my friend wrong" said Tso-ju, "it would be my duty to leave my friend. But when the friend is right, and the Sovereign wrong it is my duty to brave the latter and protect my friend. Tu-po is innocent; and if you kill him, the whole nation will despise you as an unwise ruler. And if I did not bid you stay your hand, the world would call me a bad servant of my lord. If the Emperor however, is determined to slay Tu-po, I beg that I may be permitted to die with him!"

But the Emperor's anger only increased still more, and he said: It is no more for me to kill Tu-po than to throw a dry blade of grass into the flame. The matter is not worth tiring one's lips and tongue in talking about it."

"Kill him at once," said the Emperor in conclusion. The officers thrust Tu-po out of the palace gates and cut off his head. But Tso-ju went home cut his throat and died. He is celebrated by the "Old man with the Beard," (37) in the following lines.

"Tso-ju was a perfect man
He fearlessly admonished the Emperor.
Because his friend was right, he protected him,
Because the Emperor was wrong, he defied him.
He stood faithfully by the side of his colleague,
And went to death for his friend.
His name is great in history:
A model of true friendship.

Tu-po's son, Hsi-sha, fled to the land of Tsin, where he afterwards became Minister of Justice (38), his descendants changed their family name, and some of them took that of Shih, some Fan, because estates in Fan were assigned for their maintenance. In subsequent times a temple was erected in Tu-ling as a memorial of Tu-po, the loyal servant of the crown. This temple, which still exists, received the name of Tuchu or Yu-Chiang-Chün-Miao.

But let us return to our story. When the Emperor Hsüan heard the following day of the suicide of Tso-ju, he regretted the execution of Tu-po, and returned in an ill-humour to his apartments. He could not close his eyes the next night. From that time he suffered from absence of mind and often wandered in his talk. He became exceedingly forgetful. The audiences had to be stopped frequently. On account of this illness, the Empress abstained from admonishing him.

In the first month of the autumn of the 46th year of his reign (782 B. C.) the Emperor felt somewhat better, and determined to prepare a great hunt in commemoration of his recovery. The necessary orders were given; the Minister of Minister Works directed the Imperial equipages, &c., the Public of War called up the warriors in carriages and on foot, and the Imperial Astrologer chose a lucky day. On the day fixed, the Emperor entered his carriage which was drawn by six horses. Yinchifu rode on the right side, Shaoh'u on the left. Banners and standards were carried in pairs; armour and weapons made a thick wood. Thus they went in shining masses out into the eastern plains.

The country on the eastern side of the town was flat and but thinly inhabited. The Emperors had held their hunts there from the most ancient times. Hsüan who had not come there for years, felt a new life within him, and ordered the camp to be set up. The soldiers were informed that:

- 1.—They must not tread down the standing corn;
- 2.—Nor set fire to the trees;
- 3.—In no way injure the farmers houses;
- 4.—The captured game must all be brought and laid before the Emperor; who would then distribute the rewards. Whoever kept his booty to himself, would be severely punished.

When these orders of the day were issued, zeal filled all hearts, and every one desired to distinguish himself. The manoeuvres were gone through with the greatest exactness; the charioteers showed their utmost skill; right and left, before and behind, the archers showed themselves beyond all praise in the exercise of their art; even the falcons and dogs seemed to be animated by the same zeal as the men; hares and foxes ran terrified among each other; not a shot missed; the slain game wallowed in their own

blood, and the chase was most brilliant. Hsüan-wang was in a most cheerful humour.

Meantime the sun approached its setting, and the chase was declared at an end. The soldiers tied the captured animals and birds together, and singing gay songs, set off on their homeward road.

They had gone about three or four li, when suddenly a feeling of giddiness came over the Emperor in his equipage; things glittered before his eyes, and he saw in the distance a small open carriage coming straight towards him. Two men with bows of a red colour on their backs, and red arrows in their hands, stood on it. They greeted the Emperor and said: "How has Your Majesty been since our separation?" When he looked carefully at them, the Emperor recognized in the new comers the Councillor of State Tu-po and the Vice-Councillor of State Tso-ju. His fright was great; but while he was rubbing his eyes, both men and carriage had disappeared.

The Emperor enquired from his attendants whether they had noticed any thing, but they all said that they had seen nothing whatever.

While he was pondering over this occurrence, Tu-po and Tso-ju appeared anew in their carriage, following closely on the Imperial equipage. Hsüan-wang in despair cried out. "Cursed spirits! Leave my path!" and drew his sword, T'ai-O (39) from its sheath and threw it into the empty air. Then he heard Tu-po and Tso-ju call out with a loud voice: "Useless driveller! Wretched prince, who slaughtered his innocent and most faithful servants! Thine hour is come! Here we shall revenge ourselves! Thou shalt atone for thy bloody deed with thy life!" And before the sound of the words was finished, they drew the red bow, laid the red arrow in it, and aimed at Hsüan-wang's heart. The latter fell back into his carriage with a loud shriek. The dukes of Yin and Shao were benumbed with fear. They gave him a little ginger tea in order to restore him to life. But when he recovered from his faint, he called out constantly: "I have a pain at my heart!" They returned quickly to the town and took the Emperor to the palace. In the confusion the soldiers did not get their rewards, and separated hastily. They returned as sadly now, as they had been joyful in the morning. The "Old man with the Beard" says on this subject in one of his songs:

"They came with a red bow and a red arrow to look on like gods; in the middle of the throng they went about as if soaring. The Emperor also, who had shed innocent blood, could not escape retribution—much less so than an ordinary man of the people."

And now dear reader, if you wish to know what happened afterwards to the Emperor Hsüan, you will find it in the next chapter.

(To be continued in our next.)

EXTRACT.

ENGLISH POLICY AND ENGLISH STRENGTH.

(From 'The Times'.)

The apprehensions of a collision between this country and Russia have naturally drawn some attention to the comparative resources of the two Powers. What forces could they bring to bear at once on decisive points? What strength could they gradually develop as war went on? The answer has also been a very obvious one—that England, happily, has a larger force immediately disposable than she is sometimes credited with, and that in a long contest she could develop a power so great that in comparison Russia cannot be considered a first-rate Power at all, but only one of the third or fourth, if even of so high a rank. The broad facts are that although Russia in Europe has double the population of the United Kingdom, yet our numbers are so great as to supply an inexhaustible recruiting ground, while the labour of the population is so efficient that we can support in idleness, or in such a special enterprise as that of war, much larger numbers than it is possible for Russia to support; that the quality of our people, man for man, is better; that apart from our home strength England has a vast colonial empire with a population of 250,000,000, more or less available in a contest, while Russia has but a scattered and empty territory in Asia, the population being actually about 14 millions only, while the administration of the territory is a burden upon the Russian centre; that while the

(38) Tsin, in the present Shansi.

(39) The name of the sword.

annual revenue of the United Kingdom (79 millions) somewhat exceeds that of the Russian Empire (about 70 millions only), our revenue is easily raised and from a few sources of taxation and could easily be doubled or trebled and more, but that of Russia is raised with difficulty and it is a question whether a few millions more could be added to it by any severity of taxation. When it is considered, in addition to this, that Russia is assailable at several points by England, and so her resources can be seized and her power crushed, yet England is practically invulnerable by Russia, the inference is plain that in reality the two Powers are not on the same level—that a war which might destroy Russia as a Power would be for England a war “with limited liability” only, as the Crimean War itself was. It has been easy also to point out that in all particulars, both since the beginning of the century and since the Crimean War, the changes in population and resources have all been to the advantage of England. We have now nearly half the population of Russia, instead of one-third or one-fourth as at the beginning of the century; our mercantile and war navies preponderate as they never did before, Russia, by comparison, having neither mercantile nor war navy to speak of; our manufactures have multiplied, while Russia remains a country of backward agriculture. Much of our Indian Empire and a great part of our English-speaking colonies have been added to our dominion during the present century, while Russia has had the doubtful advantage of annexing Eastern Siberia, Central Asia, Poland, and other burdensome possessions. In no one respect has Russia advanced more rapidly, unless it be lately in the cultivation of a land army after the German system, which makes her more formidable at first to her immediate neighbours on land, but not to a Power like England, whose centre she cannot assail. All these are points of a comparison which can be easily made, but from which we fear the wrong conclusion is sometimes drawn. There is a sort of angry feeling that English strength is not appreciated abroad; that we must display it in order to be feared; that Russia in particular has set us at defiance, and should be taught reason, or we shall lose our prestige in the world. The conclusion should rather be that our power is so great and manifest that we may abstain from mere display; that we can afford to suffer some loss of prestige, or some appearance of its loss, rather than incur the certain loss of a war, however successful it may be, if the war is otherwise without sufficient reason; that as the foremost Power of the world, we have to set an example of forbearance and love of peace which will restrain the growth of the war spirit throughout the world and give time for the development of influences by which militarism everywhere, it may be hoped, will become discredited and will decay. If anything could reconcile us to this conclusion, it should be the spectacle of our national progress during the last half century—a spectacle of rapid internal development and growth in civilization such as no other people or nation has ever before displayed. If we have grown and prospered by this forbearance, we should not lightly change our policy, but watch and wait, if possible, to see what will really come of the changes and tumults of the hour.

An article in a recent number of the *Fortnightly Review*, by Mr. T. H. Farrer, the Secretary of the Board of Trade, on “The Strength of England,” presents almost all the materials for making such a survey of our past progress, while touching on some points of contrast between our progress and that of other nations, especially of Russia, which are most instructive. The general drift is that in population, wealth, morality, political and social content, religion, the progress from the time of the Regency to the present time has made England a new world. To begin with, nothing is more remarkable than the mere increase of population—itself a sign of prosperity, so long as there is no falling back in the scale of living, for the nation could not grow without resources to maintain the increasing numbers. The population of Great Britain has more than doubled during the last 60 years. In 1810 we were about 12,000,000 only; now our numbers are 28,900,000. Putting Great Britain, France, Germany, Austria, and Russia in Europe together, our 12 millions at the end of the great war were less than 10 per cent. of the population of these countries together; now our 28 millions exceed 13 per cent. of the aggregate. The exact change which has occurred is usually concealed in these comparisons by dealing with the totals for the United Kingdom. We bring into the account Ireland with its five millions of people, who were really a drawback to and not an addition to our national strength sixty years ago, and as Ireland has not increased in numbers since that time the real growth of Great Britain, and especially of England, is concealed. The change in our position is most striking relatively to France. France in 1810 had double the population of Great Britain and more; now she is only one third larger, if so much, and the difference is diminishing day by day. Our change as regards Russia is that in 1810 or thereabouts

Great Britain had only about a fourth of the population of Russia in Europe, now she has between a third and a half. By the mere growth of numbers, assuming only an equal growth in resources, we have thus altered the “balance of power” in our favour.

But not only have we increased in numbers, we have progressed in every particular which constitutes the welfare of a people in a wonderful way. Take the most general figures as to the increase of wealth. While the population, as we have seen, has rather more than doubled since the beginning of the century, the aggregate income has rather more than quadrupled. The assessments to the Income-tax in Great Britain in 1815 were about £130,000,000 annually, the assessments then reaching a lower stratum than they now do; but in 1875 these assessments were £536,000,000, or quite four times what they were 60 years ago. It may be said, of course, that the Income-tax is no fair representation of the growth of wealth, but the reply is that whether we take the legacy duty or any other test, the result is still the same. The capital annually subject to legacy duty about 1815 was between 25 and 30 millions sterling; it is now in Great Britain alone about £100,000,000 sterling. The estimates of national capital show like progress. The national estate could be valued at little over 2,000 millions 60 years ago. According to Mr. Giffen's estimate in a paper lately read by him at the Statistical Society, the value of the capital possessed by the people of the United Kingdom is 8,500 millions, and this estimate is pronounced by the best statistical authority to be probably under and not over the mark.

In the essentials of numbers and wealth, therefore, England has marvellously changed for the better since the days of the great Napoleonic wars. At the very least, wealth having doubled twice as fast as the people, we have to add to the doubling of our strength by numbers the additional power we have obtained by the greater intelligence of the people and the greater effectiveness of our industry in proportion to the numbers engaged. The addition is not merely in proportion to the wealth added; the *gross* amount added is, in fact, an addition to our surplus resources. Say the people of Great Britain in 1815, with a gross income of nearly £300,000,000, or £25 per head, could spare £100,000,000, or one-third of that gross income for the uses of the State, whether in taxation or in loans, it is quite clear that double the numbers with a gross income of £50 per head could spare not only twice 100 millions for the uses of the State, but a very much larger sum. If they kept only for their own private expenditure what they kept in 1815, the sum they could spare for the State would be more nearly six hundred millions. Of course the rise in the scale of living makes it impossible that this last sum could be spared, but the difference between one hundred millions and six hundred millions shows what a vast margin there must be for the Government of England to draw upon if we are to make anything like the efforts which the nation made at the beginning of the century. It will be thought, perhaps, judging by the talk which is often heard about increasing expenditure, that the nation is using up its power in proportionate extravagance, but nothing could be farther from the truth. We have not even increased taxation and expenditure in proportion to the growth of our numbers. We have hardly increased our taxation and expenditure at all. In 1826, 10 years after the great wars; although taxes had been reduced in the interval, the amount of taxation raised in the United Kingdom was still £55,325,000; in 1851, just before the Crimean War, the amount was £54,485,000; now, the amount is £68,514,000. Instead of doubling, as it might have done, had it increased proportionally to our numbers, or quadrupling, as it might have done, had it increased proportionally to our wealth, the amount levied in taxation has only been added to by one-fourth part as compared with what it was half a century ago. Per head, in spite of our increase of wealth, it is only 41s. 5d. now, against 49s. 5d. in 1826. There is thus a wide margin for our Chancellors of the Exchequer, even if they should not seek to go beyond raising the sum of 200 millions, which might even now be raised, merely keeping the proportions to numbers which existed 60 years ago and making no allowance whatever for the intermediate increase of wealth. So far therefore, from indulging in national extravagance as our wealth has increased, we have kept far within bounds, and there is a huge margin to come and go upon before we even begin to lay upon shoulders more able to bear them burdens like those which were borne 60 years ago. Curiously enough, England stands alone among European States in this diminution of national burdens. The taxation of France in the same period has increased from 20s. 1d. to 43s. 7d. per head, and in Prussia, Belgium, Russia, and Holland there has equally been an increase per head. What is the “potential taxation of England?” may be still more directly shown. Mr. Farrer says:—

“There is scarcely an item in the present list of British taxes which might not be indefinitely raised, except, perhaps, the tax on

spirits and tobacco. An addition of a penny to the Income-tax produces £1,800,000 and that tax, now at 3d., was at 16d. during the Crimean war, and at 10d. so late as 1860. The results of recent reductions of taxation are as follows:—Between 1840 and 1852—i. e., in the free-trade period preceding the Crimean War—the net reduction of taxation was £6,286,000. During the Crimean War period of 1853 to 1858, there was practically no permanent increase of taxation, as the war taxes had been got rid of by 1858, and there was a net reduction of £730,000. Between 1863 and the present time—i. e., during the free trade period subsequent to the Crimean War—the net reduction has been £25,010,000. The total net reduction of taxation since 1840 is £32,026,000 per annum. In the same period the net revenue from taxes remaining unrepealed has increased from £51,082,000 in 1841 to £68,514,000 in 1877. Adding to the latter sum the reduced or repealed taxes, we have, supposing the repealed taxes to be now reimposed, a total of potentially increased revenue from taxation amounting to £100,540,000, as compared with £51,082,000 in 1841, without allowing anything for increased productiveness in the repealed taxes."

Everything thus combines to show the magnitude of the country, as well as of the national borrowing power, if any necessity to call on them should arise:

After these general figures it is perhaps unnecessary to go into detail, but they are fully confirmed by the totals of our trade and shipping. The exports of British and Irish produce which were £48,000,000 in 1810, are now £200,000,000, an increase of more than four times, while the increase is even greater if we reckon from 1820 or 1830. Whatever falling off there may have been lately therefore from a high level previously attained, there is certainly a wonderful progress if we look back over a long period. The increase of imports has been at least as remarkable, if not more remarkable. Our internal trade, again, has made as striking progress. In the chief textile manufactures of the United Kingdom—cotton, woollen, worsted, silk, flax, and jute—the number of factories in 1835 was 3,792, and number of persons employed 381,000, and in 1874 the number of factories had grown to 6,524, and number of persons employed to 969,000. In 40 years, therefore, without reckoning at all the new kinds of textile manufacturing constantly being introduced, there has been this remarkable growth in our chief textile trades. The work, as Mr. Farrer points out, has also become much more efficient in proportion to the numbers employed. The quantity of raw cotton consumed was 116 million pounds in 1817, 333 millions in 1835, 657 millions in 1849, and 1,416 millions in 1871. The quantity of wool consumed was 103 millions of pounds in 1800, 210 millions in 1849, and 392 millions in 1876. The manufacturing, we believe, has also grown more elaborate in proportion to the raw material used, so that the mere increase in the raw material does not show the whole increase in business done. In the mineral production of the United Kingdom—that is, in coal and iron, which are by far the most important of our mineral products—there has been even more marvellous progress. In the first 20 years of the century the production of coal was estimated at 11 million tons, and of pig-iron (1823) 442,000 tons. But in 1875 the production of coal was 131,867,000 tons, or 12 times what it had been, and of pig-iron 6,365,000 tons, or fifteen times what it had been. The progress of railway traffic is equally striking. Since 1849, when the country began to have a tolerably complete system, the increase of receipts has been from £11,806,000 to £59,917,000, and the increase of goods conveyed between 1860 and 1875, for which period the figures are given by Mr. Farrer, has been from 89,858,090 to 205,965,000 tons. There is little wonder that with such a trade the increase of wealth in the United Kingdom reaches the bewildering totals which have been stated. The facts as to our merchant shipping are a fitting climax to this wonderful record. In 1820 the merchant navy of the United Kingdom amounted to 2,412,000 tons; in 1876, to 6,197,000 tons—the tonnage of the latter year, as it consisted largely of steamers which hardly existed in 1820, being far more valuable and efficient. In steam tonnage alone the increase in the United Kingdom has been from 87,000 in 1840, to 2,002,000 in 1876, our steam navy, as Mr. Farrer states, being now "twice as large as all the other ocean-going steam merchant navies of the world."

The reflection may occur to some that it is not enough to prove an increase of wealth and numbers to show the progress of the nation—that the question of the distribution of wealth remains. Are the people, it may be asked, happier, better, and stronger, comparing the average man of the present time with his predecessor half a century ago? Happily on this head the evidence is clear and unmistakable. As is almost notorious, notwithstanding all the increase of wealth which has occurred, the price of wheat, the staple food of the masses, has been much lower during the last 30 years than before the free-trade period. The consumption has also increased. Thirty years ago, according to Mr. Caird, the consumption of wheat per head was about 5 1-10th bushels, or 311lb.; in 1868 it had increased to 5 3-10th bushels, or 335lb.; it is now

341lb. Our sources of supply are more largely foreign than they were, but we are here only concerned with the fact of consumption itself. It would be, perhaps, impossible to show the facts by figures, but there is undoubtedly also a larger consumption of meat by the masses than there formerly was. Thus as regards the necessities of life the people, man for man, are better nourished than they were, presumably therefore of better physical quality and greatly stronger in the mass if any call were made on them. That the growing wealth of the last half century has also been distributed among the masses is further shown by the increasing consumption of certain articles of luxury. Not to speak of spirits, beer, and wine, where the increase of consumption is of doubtful advantage, we find the consumption of tea to have increased from 1-46lb per head in 1835 to 4-44lb per head in 1875; and of sugar from 17-19lb per head to 62-85lb per head. This increase is partly due to the lowering of duties, but the lowering of duties has only been one mode among others of increasing the national wealth, and the expenditure per head on these articles, owing to the quantities being so much greater, is still larger than it was. These are not the only signs of improvement in the character of the people. We have to add such a fact as the increase of savings-bank deposits from 11s. 4d. per head of the population in 1830, and 21s. per head in 1850, to 42s. 6d. per head in 1876. The number of paupers and cost of pauperism have also greatly declined. Between 1813 and 1830 the number of paupers in England alone must have been 1,500,000 or upwards (the numbers as late as 1841 being 1,250,000), while the cost of poor relief ranged from 6½ to 8½ millions, being equal to from 10s. to 15s. per head of the population. In 1876 the number of paupers, notwithstanding the increase of the general population in the interval, was only 752,000, and the cost of poor relief, notwithstanding greater humanity in the administration, was little over seven millions, or 6s. 1d. per head of the population. The "sore" of pauperism is thus infinitely less formidable and threatening than it was half a century ago. It is the same with crime. The commitments for trial in England for serious crime were 13,932 in 1817; 27,760 in 1811; 27,960 in 1851; but in 1876, only 16,078. The population has been steadily increasing, but serious crime is little more now than in the early part of the century, and much less—almost one-half less—than in 1841 and 1851. Criminal statistics are difficult to use on account of changes in the denominations of crime, forms of procedure, and the vigilance of the police; but with all qualifications of these figures they still prove a diminished proportion of crime in the population. The diminution is also greatest in the class of offences against property. There are no direct education statistics in the paper before us, but the development of trade and industry indicates increased intelligence, while the facts as to the increasing outlay for many years on education are too notorious for controversy. Altogether, it is beyond question that in physical and moral well-being the people of England, man for man, are much better than they were half a century ago; they are more in numbers, and the units on the average are not only richer, but physically and morally superior to what they were.

All this material and moral progress has also been coincident with an advance in political and social content, which we are sometimes apt to forget amid the din of contests between "labour and capital," but which forces itself upon every reader of the modern history of England. From 1800 to 1850 the history is full of political and Trades Union riots, suspensions of *habeas corpus*, breaking of machinery by infuriated workmen, stack-burning, and other social and industrial calamities. Since 1850 we have hardly known what a political riot is, and strikes and other contests between capital and labour are but seldom marked with violence and crime. All the while our laws against crime and political offences have become milder in themselves and in their application. The tone of feeling and opinion in all these matters is so different from what it was that we can hardly imagine now the conditions of 40 or 50 years since, when social distress, crime, and political agitation abounded. Sir James Mackintosh remarked, with reference to the change of opinion about crime alone, that he could almost think he had lived in two different countries and conversed with people who spoke two different languages. The remark might be much more general. The moral and social atmosphere of the present time differs so greatly, and differs so greatly for the better, from that of the period before 1830 or even before 1840, that it is hardly possible to suppose a transformation so great could have been made in little more than a single generation.

To come back to our present argument, one of the secrets of this wonderful advance has undoubtedly been our happy freedom from Continental war, and our abstention from entangling alliances. Without reflecting on our former policy—for the circumstances of former periods, as, for instance, during our great struggle with France, may have been such as to compel us to fight for

European freedom—we may, at least, note that, so far as one can judge, the nation has been well-advised in disregarding since the Crimean war all pretexts for the support of British prestige or more than doubtful British interests by armed interference abroad. We are now far stronger than we were in comparison with our neighbours, because we have not competed with them in the race of bloated armaments in time of peace; and the barbarous feelings and habits of violence which protracted war stimulated among us at the beginning of the century have been changed for the better. In this way our taxation per head has diminished, while that of our neighbours has increased, although our increase of wealth and industrial prosperity has been far greater than theirs. If we had had such another war period as that at the beginning of the century to go through, no such progress would have been possible. The amount of the war outlay alone must have made an enormous difference in the annual accumulations of capital and the wages of the masses, and the state of war would have affected the whole tone of feeling throughout the country. The conclusion clearly is that on any new emergency the results of the policy of the last 60 years should be remembered. We see what is gained by merely resting and suffering the internal growth of the nation to proceed. Against all external changes adverse to us an internal force is growing day by day. Every ten years the addition to our population alone without war is now almost as great as the numbers Russia would add to her territory by annexing half Turkey in Europe, while the quality of our people and the capital they possess make the addition, perhaps, as valuable in point of force as an addition to Russia of half the Turkish Empire would be. We do not say that there can be no events abroad calling for interference, or that there are no such events at the present time. All we wish to point out is that the strength we have acquired during long years of peace, and our daily growing strength as our numbers and capital increase, should dispose us to be less and not more jealous of alleged encroachments—more and not less disposed to go our own way, and pursue our own policy, as we see other nations oppressed by the burden of enormous armaments and wasting every now and again in a few years or months of war the fruits of many years of peace. Our want of preparation has perhaps been excessive, but that is a defect which could be easily corrected without adding much to our burdens.

THE JAPAN TIMES,
A WEEKLY REVIEW OF
JAPANESE COMMERCE, POLITICS, LITERATURE
AND ART.

Price Twenty-four Dollars Per Annum.

CONTENTS OF No. 25. NEW SERIES, VOL. I. JUNE 22ND, 1878

Mail steamer register.—Reports of Import and Export Trade for March April and May Commercial and Shipping Intelligence, &c., &c. Advertisements.

YOKOHAMA MARKET REPORT.

FRIDAY EVENING, June 21st, 1878.

IMPORTS:—During the week all business has been small, and quotations show no change worthy of notice.

YARN. Deliveries of contract yarn have been made on a large scale, a very satisfactory indication of the healthy demand existing for consumption. Direct sales have, however, been insignificant, but the prices given are those at which the sales have been effected.

SHIRTINGS are in very small enquiry. Sales of 8½ lb have been made at \$1.97½ and of 9 lb at \$2.12½; the highest quotations being \$2.25 and \$2.42½ respectively for the superior class of goods. The consumption of foreign made shirtings is declining in a very marked degree, goods of fair to superior quality having quite lost their hold of the market.

VELVETS are in large supply, and the few sales made have been at a reduction on former quotations.

TURKEY REDS show an advance in price, due, however, more to the superiority in the goods than to special demand.

MOUSSELINEs are firmer at a slight advance.

EXPORTS:—SILK. We refer to this article in our leading columns. We shall not give quotations in this report until there is enough produce brought down to make a market.

TEA:—The rumor of the reimposition of the Tea duty in the United States lacking confirmation, the excitement has died out and for two or three days the market was depressed and quiet; but buyers again seeking samples, prices have slightly hardened and close firm at our quoted rates.

Settlements for the week about Pcls. 5,500 and stocks in first hands of all grades, about Pcls. 6,000. We give below the cargo sent away per steamer *City of Peking* on the 19th inst.

CHINA TEA.		JAPAN TEA.

" Other Cities...	10 "	Total...	37 Bales
Total...	96 Bales		

EXCHANGE:—A fair business was done in the early part of the past week in private paper on London at 3s. 11½, but since the departure of the American mail on the 19th inst., the Market has been quieter and weaker, and sales to a small extent have been made at 3s. 11¾. The tendency continues in favour of sellers. In Bank Bills, a moderate business was transacted at 3s. 11½, but the quotation to-day is 3s. 11½.

There is very little business or change to report in local rates; an eighth better may be quoted on Shanghai for Bank, but no change on Hongkong.

On New York and San Francisco, only small business is reported at quotations. We quote:—

ON LONDON, Bank 6 m. s.....	3s. 11¼d	ON PARIS, Bank 6 m. s.....	4.97½	ON SHANGHAI, Bank sight.....	72½

PASSENGERS:—Per American steamer, *City of Peking*, from Hongkong:—Miss Van Dycke, Messrs. J. Beale, and G. Banks. For San Francisco: Miss Anderson, Rev. A. Jagliabre, Mrs. E. Biber, Mr. and Mrs. J. B. Mackie, Miss L. B. Ross, Messrs. Charles De Costar, Henry Mansfield, and B. J. Kick in cabin; and 2 Europeans, and 192 Chinese in steerage.

Per French steamer, *Tibre*, from Hongkong:—Baron Stillfried, Messrs. Umikami, and Kitomuro.

Per Japanese steamer, *Hiroshima Maru*, from Shanghai and ports:—Mrs. Brooke, Miss Cora Bell, Revd. E. H. Thompson and 2 children, Pay-Inspector G. E. Thornton, U.S.N., Paymaster Shamin, U.S.N., Messrs. R. S. Schwabe, K. Kingdon, J. Reach, L. Holmes, J. J. Bolton, Von Fischer, A. Warner, R. H. Cooke, Parsons, C. McGerrow, C. Schmitz, and 7 Japanese in cabin; and 3 Europeans, 100 Japanese, and 4 Chinese in steerage.

Per British steamer *Mikado* from London via Hongkong:—Miss O'Hana and servant, Mrs. Hopkins and two children. For Hiogo: Mr. Palon.

Per Japanese steamer *Sumida Maru*, from Hakodate:—Rev. Mr. and Mrs. Davison, Dr. and Mrs. Fifer and two Children, Messrs. Blume and Wilson.

LEFT PORT FOR JAPAN:—FROM LONDON FOR CHINA AND JAPAN PORTS.

FROM LONDON FOR JAPAN DIRECT:—"Fair Leader," Sept. 25; "Flying Spur," Jan. 9; Feb. 19; "Laurel," Feb. 17; "Bon Accord," Mar. 21; "Berwickshire," April 26.

FROM NEW YORK:—"William Hales," Jan. 24; "City of Boston," Mar. 8; "G. H. Ingersoll," Mar. 15; "Hattie E. Tapley," Mar. 19; "Francisca," April 7; "Pym," March 20.

FROM BALTIMORE:—"Christine," July 3.

FROM PLYMOUTH:—"Earl of Devon," Jan. 27, from Antwerp to Yokohama.

FROM SHIELDS:—"Dr. Petermann," Jan. 7.

PASSED ANJER:—"Fair Leader," Apr. 8.

FROM NEWPORT:—"Windermere," Mar. 11.

FROM HONGKONG:—"Orissa," June 16.

FROM SAN FRANCISCO:—"China," June 4.

FROM MIDDLESBRO:—"Midyoshi," April 14.

LOADING FOR JAPAN:—AT LONDON:—S. S. "Sumatra," "John Milton." At Hamburg:—"Buck."

MAILS DUE FROM:—Hongkong P. & O. str., June 25th; Hongkong M. M. str., July 3rd; San Francisco, P. M. str., June 26th; Shanghai, Kobe and Nagasaki M. B. M. str., June 29th.

CARGO:—Per French steamer, *Tibre*, from Hongkong:—General from Europe, 2,393 packages; General from Hongkong, 202 packages; Sugar from Hongkong, 1,867 packages; Total, 4,462 packages.

Per Japanese steamer, *Hiroshima Maru*, from Shanghai and ports:—Treasure, \$15,000.00.

REPORTS:—The American steamer *City of Peking* reports:—Left Hongkong on the 10th inst., at 3 p.m., with 11 cabin, 3 European and 192 Chinese steerage passengers, 2,725 tons cargo, and 7 bags mails. Experienced light N. E. winds during passage. Passed French Mail S. S. *Tibre* on the 10th inst. Arrived in Yokohama at 2.24 p.m., on the 15th inst.

The American barque *Neriad* reports:—Left Newcastle, N.S.W., on the 16th March: was 61 days to the Equator, which was crossed in Longitude 162° East. Calms and light baffling airs all the way to this. Have been twelve days within three days sail of port and three days within 70 miles. Easterly winds the past 15 days.

The British barque *Nimrod* reports:—Calms and light adverse winds entire passage.

SCHOOL FOR CHILDREN IN SWITZERLAND.

MADAME A. JAQUEMOT (née Dogny) proposes to establish at Geneva, Switzerland, a Boarding School for Girls, and for Boys under 12 years of age; where they will have the advantages of a sound education and sedulous domestic care.

Boys over 12 years of age may be committed to Madame Jaquemot's charge as boarders, and parents can thus secure for them the comforts of a home, with the opportunity of attending one or other of those educational establishments for which Geneva is so justly celebrated.

Parents wishful to place children under her charge at the Pension Dogny, may address their enquiries as to terms &c. to the Editor of the *Japan Times*, who is empowered to furnish them.

IRREGULAR IRREGULARITIES.

MANY a true word is, proverbially, spoken in jest, and our slight allusion, in the 'Notes' of last week's gossip, to the delay in despatching the *City of Peking* on her voyage to San Francisco, may with propriety be made the text of more serious remark. We are fully aware of the magnitude of the work to be done in unloading and re-loading such a vessel as this, and we cordially give all the credit which is justly due to the administrative power which can unship, ship and tranship between three and four thousand tons of cargo, coal and stores, in the space of sixty or seventy hours. In these days of close competition between shipping companies, too, the necessity of utilizing every hour ought to receive full weight at the hands of those whose duty may call them to criticize the working of such enterprises. And especial care should also be taken in apportioning what blame has to be shared, properly amongst those who should bear it, lest to the critic be applied the often too apt quotation in such cases:—

"Dat veniam corvis, vexat censura columbas."

But shipping Companies live and work under the Common Carriers' Act, in England, and under equivalent legislative statutes in other countries, and they are the servants,—perhaps, after bankers, the most important servants, of any mercantile community. And experience has always shown us that it is practically impossible for any shipping Company to secure, and retain for any length of time, such a monopoly of the carrying trade of any section of the world's commerce as will make it independent of the merchants whose goods its vessels carry, and thus transfer it from the position of a servant to that of a master. Of these facts, the Directors and Managers of shipping Companies are fully aware; their own interests therefore and a wholesome fear of competition must always be actively operating to induce them to study carefully the convenience of their clients. But as good servants very often take charge, to a certain extent, of careless masters and their property, so it is always within the power of shipping Companies—and is always ultimately acknowledged as a benefit—to lay down rules, to which they may compel their employers to conform. When these are seen to be reasonable and convenient to the general body of traders, they are conformed to cheerfully, in spite of occasional hardship or inconvenience which their action may inflict on individuals. When they are inconvenient to the majority, the fact is immediately discovered and the rules repealed.

Applying these principles to the case of the two great shipping lines on which China and Japan depend for trade communication with the United States, we find them acknowledged and fairly acted up to, except in one particular, on which a complaint may, we think, be fairly based. And we think the mercantile communities of the ports at which their vessels touch will unite with ourselves in giving the personal staffs of all their establishments full credit

for civility, anxiety to oblige their constituents, and a most laudable energy in rapidly transacting their business. But they are neither of them in the position of such Companies as the Peninsular and Oriental, the Messageries Maritimes, the Royal Mail, or any of the other great European Steam Navigation lines, subject, as to their dates of arrival or departure, to the orders of a Post Master General, or liable to heavy fine in case of breach of his regulations. They fix their own dates of departure, to suit—partly, the requirements of the public,—partly their own profit and convenience; the latter—we are bound to say,—being, as a general rule, subordinated to the former. Hence their duty to the public is held to be sufficiently discharged, if they make due advertisement of their dates of sailing, without issuing—as the Postal Companies do—a schedule of dates of arrival and departure for a period. But we think all will agree with us that the nearer these independent Companies approach the regular system the better, and there can be no doubt that—the date of departure once advertised—it should be strictly adhered to, except in extraordinary cases, and that then ample notice should be given of postponement. We are not inclined to make much allowance for unforeseen causes of delay, because we hold that the interval estimated as necessary between the arrival and departure of a vessel should be of such a length as to include the majority of such accidents, and though a few extra hours of the steamer's time might thus be sometimes given away, this is a concession which the mercantile public has a right to demand. And also we insist that an Agent should err on the side against his ship's convenience when delay is probable, even possible, beyond the originally advertised time, and not cling too long to the hope of being able to keep his original engagement. For irregularities in arrivals and departures we are prepared, in the case of Companies not under Postal control, but when irregular dates are irregularly kept, then Pelion is heaped upon Ossa, and oppressed Commerce has a right to groan.

The P. M. S. S. Co.'s *City of Peking* arrived on Saturday, the 5th instant, from Hongkong, and her departure was immediately advertised for Wednesday, the 9th, inst. at daybreak. At midnight on Tuesday, the European staff of the office personally went round the settlement to warn shippers "that some delay in departure would probably be necessary: in event, however, of the steamer being in readiness to sail at the appointed hour (daybreak), the Company would, in view of the inconvenience attending upon uncertainty, detain her until 9 a.m. at the earliest, As a fact, the vessel sailed at 11.15 a.m."

We quote this statement, of purpose, from the *Gazette*, because that journal took upon itself the defence of the Company against complaints lodged against it in the columns of the *Herald*. It proceeded to argue that this midnight notice (we put out of court the doubt expressed elsewhere whether the notice given was 'official') was the

only means open to the Agent to lessen the inconvenience resulting from the delay. The delay itself the *Gazette* accounted for, and justly, by the fact that Sunday being wet, the arrangements made for working on that day were futile and that, consequently, twenty hours or so were lost. Also that the *Hiroshima Maru* from Kobe, with a large cargo for transshipment, was late, and that several important shippers, who had also been prevented from sending their tea on board on Sunday, had to be accommodated; and finally that, at this season of the year, it is difficult to get coolies, in any number, to work in an emergency.

We are quite willing to admit the value of all these arguments as sufficient reason for the delay—the more so, that they all weigh equally heavily in favour of our contention that sufficient notice of the postponement was not given. Granting that an unusually large amount of cargo, coal, and stores had to be got out of and into the ship and that labour was scarce; that important constituents had to be accommodated, &c., these facts must have all been known to the Agent on Saturday afternoon, when the departure of the vessel was advertised for Wednesday at daybreak; and it is to be presumed that the eighty-odd hours he allowed for the work was the time during which he deemed the work could be comfortably done. But Sunday was wet, and twenty hours were lost. Would it not have been better, then, on Monday morning, to have advertised a postponement of sufficient length to have made up for the time lost, instead of trying to crush eighty hours' work into sixty, and making every one concerned uncomfortable? Clearly so,—and we believe that the Agents of the two great Pacific Shipping Companies only require so common-sense a proposal to be made to them to accept it. They have ample means of estimating the amount of work to be got through for the despatch of each vessel, and their experience teaches them better than any one can tell them, in how many working hours that work can be done. Let them make their estimate—allowing the necessary small margin for contingencies—and advertise the hour of departure. Then, when bad weather, or some other extraordinary circumstance, deprives them of a certain number of working hours, let them *immediately* advertise a postponement. If this were made an invariable rule, and if the public could rely on the fact that six hours' rain, or weather so rough as to interrupt shipping, meant six hours' postponement of the original date of departure, there would be no cause for complaint. What merchants and bankers have complained of hitherto—and justly—is that when postponement is possible, or even probable, it is not soon enough made certain. Enquiries at the office are always met by the reply that no positive information can be given on the subject, and thus, from the otherwise laudable desire to keep faith with their customers according to their first published announcement—in which, after all, they generally fail—the Agents provoke indignation, and waste of tissue and temper, which in hot weather and a busy season are better spared. And for what? To gain a dozen hours in a voyage of from twenty to thirty days!

WASTED LABOUR.

ABOUT fifty feet more of the Creek wall, in front of the French Consular ground and of the British Naval Yard, slipped down on the night of the 27th instant, thus giving a couple of months', or more, of employment to the contractor for the works, and a few hundred dollars to the officials who 'stand in' with him. Though almost incredible to Europeans, it is a fact that the reason given by the local Government, for persisting in building up the Creek and Bund walls in the fashion we see,—which involves these periodical falls, and easy destruction in high wind—is that if they were properly constructed, they

would not occasionally fall, and so give employment to a number of very worthy people. No foundation is laid—a bank of timber is used as a sill, placed upon the mud, and on this the stones, roughly square on the outer face, and tapering to a point on the inner, resembling nothing so much as the rind of a pineapple, are laid in rows, without cement, mortar, or other means of attachment, and against this the earth is filled up from behind. In course of time, of course, the timber rots and sags down, the wave-like line along the wall indicating clearly enough the points of failure, as they occur. Then comes a night of heavy rain, which saturates the backing of earth and increases the pressure on the facing; the rotten sill gives way, down comes a rood or two of wall, and 'employment' is given to a fresh batch of coolies who—as happens at this moment—could be much more usefully employed in the rice-fields.

It is curious how difficult it appears to be to drive into the heads of even educated Japanese,—men, apparently, of more than average intelligence—the rudimentary principles of Plutonomy. This idea, for instance, of 'finding employment' for labour, cannot be eradicated at present. They cannot see that labour is capital, and that to waste labour is as foolish and wrong as to burn food. The late Governor of Hiogo was quite a cultivated man. He took, specially, a great interest in astronomy and applied mathematics, was the author of some translations from foreign standard works on these subjects, and spent the major part of his official salary, during his tenure of office, in building and endowing schools within the district over which he ruled. Yet he could not be brought to see the truth, so self-evident to the European mind, that wasting labour was equivalent to wasting money. All along the shore between Kobe and Osaka the land rises gradually from the sea towards a range of bluffs, leaving a 'carse' or strip of fertile land between the beach and the hills. At frequent intervals, these hills are pierced by gorges, down which flow torrents. The hills being chiefly composed of a granite which is easily disintegrated, these streams, as they have been flowing for centuries, have gradually cut out beds for themselves, and bring down large deposits of sand to the entrance of the gorges, through which they filter to the sea, rarely—except after very heavy rains, showing above ground even a thread of water. At intervals up the valleys, to a distance, sometimes, of nearly three miles from the beach, are dotted rice-cleaning mills, the most remote of which are on a level of at least twelve hundred feet above high-water mark. And up the passes may be daily seen strings of bullocks carrying the uncleaned rice to the mills, and other strings of bullocks bringing down the cleaned rice to the shore. Meanwhile the rice is grown on the lower grounds and frequent trouble is experienced from want of water.

Now it was found impossible to convince this educated, intelligent, cultivated Governor that it would pay better than the existing system, to dam up the streams in reservoirs, which could be most easily made, by building across the necks of natural bottle-shaped cavities with hard rock sides,—of which in these gorges there is no lack,—thence to bring down the water in iron pipes or even in wooden flumes, to the beach, and there,—by means of the enormous water power thus given, to work fifty times as many rice mills as were required, besides ensuring a constant supply of water, at need, for the rice fields, and saving nine-tenths of the precious fluid which now sinks into the sand. He placidly listened to the details of the scheme, and then—as a crushing and totally sufficient reply—asked:—'But what would the people do who now carry the rice up and down, and whose means of livelihood would thus be taken away from them?' And from this position, figures, facts, argument and persuasion failed to move His Excellency.

He is, here, a typical man. And in a country, long secluded from the rest of the world, consequently without foreign commerce, and ruled over by a despotism of a paternal character, the existence of the type must not surprise us. The Mikado was heaven-born, at once Emperor and God; the nobles either traced their descent from collateral branches of his stock, or held their rank and power by virtue of service paid, the *samurai* were the executants of the will of their lords, and the administrators of the government. To support this hierarchy, aristocracy and gentry, the people toiled; and in exchange for their labour and their submission, all they asked was permission to live, and the wherewithal to support life. In a country without foreign trade, accumulation of wealth could only come from the saved surplus of its own production, and as civil war, infanticide, and other causes unnecessary to enumerate, always kept down population, a surplus was forthcoming, even from the limited area of land under cultivation and from its almost untouched mines. For in Japan, blessed with such a climate, and such a soil, that the earth had but to be 'ticked with a plough, to make her laugh with a harvest'—where cotton, silk, tea, sugar, tobacco, rice and barley were all either indigenous, or had been imported so long ago, and had taken so kindly to the soil that their origin was forgotten,—food, clothing and shelter were easily and cheaply got, at a *minimum* of labour for a *maximum* of return. The people's wants were few, and luxury was the birthright of the nobles,—and to their credit be it said—luxury meant rather the exquisite simplicity of perfect art than costly display of barbaric gold. Thus the duty of the rulers towards the ruled was simplified,—to provide that each man should have the wherewithal to feed, and clothe, and house himself and his family. A task, then, easily discharged and a living so easily earned, that two-thirds of life-time was left for leisure. That each man should then have a small amount of work doled out to him to do, that a large number of labourers should be employed to turn out a small product, was natural enough, and the character of ancient Japanese art-work, lovingly lingered over and finished with utmost elaboration, is alone sufficient to indicate the habits of the people. A country of large and easily developed resources, inhabited by a sparse population with few wants, and without incentive to accumulate wealth, must necessarily be a land of leisure.

But all this is changed. Japan, not knowing its own good, or the blessing of repose, is now possessed with the spirit of "progress;" is ambitious, restless, eager to accumulate wealth, lavish to spend it on new and foreign luxuries. Her Emperor has been discovered to be mortal, her ancient nobility has been vulgarized, her chivalry extinguished or laughed away. Magnificent piles of stone and brick and stucco, incongruous conglomerations of every style of architecture—Greek, Roman, debased Gothic, baser *Renaissances*,—disfigure the Capital and even the provincial towns, and provide prey for the great earthquake which is nearly due; while the exquisite monuments of their own lovely, artistic past,—such as the Shrines of Shiba, than which nothing remains on earth more beautiful, nothing more nearly approaching perfection, in form, colour, proportion and harmony, are abandoned to decay. Their picturesque, cheap, comfortable dress is abandoned for ugly, costly European slops, in which they look more like monkeys than men, foreign furniture is imported into their houses; foreign food and drink, unhealthy and unsuitable to their climate and their race, is brought to their tables, and foreign luxuries of every kind, even up to iron-clads, rifled cannon and the latest improvements in deadly weapons, are provided, to be the 'loot' of the first foreign power whom it may suit to seize them. This is New Japan. But for all these

luxuries, money must be found,—money to waste in costly experiments, undertaken without thought, and abandoned without fair trial; money to squander on the useless trash we have named, money to gratify the new tastes, to indulge the new vices, which have been imported to spoil the people, to kill the old simple life of joy. Be it so. But, abandoning her old happier conservatism, and entering into this feverish, worn-out artificial outer world of ours, she cannot do it by halves. The price of increased labour must be paid to buy this increase of 'pleasure,' this 'civilization'—to pay for her ticket on the railway of 'progress.' And her rulers and her people must learn, therefore—and learn soon—all the hard lessons of modern trade: of which the first is that Labour means Money, and Capital Accumulation, and that consequently economy of labour is the readiest way to wealth.

L' ENVOY.

IN THE first number of this Review, we gave but an 'Apology for a Prologue'—alleging in excuse that the reputation won by the *Japan Times*' first series entitled its second to immunity from the necessity of publishing a manifesto of its policy or its aims. With this, the last number of the volume, we present our readers with our Index, and this slight reference to it must stand us in the stead of l' Envoy.

Those who, like ourselves, have often had to turn over thousands of pages of those best histories of New Japan, the files of the foreign Press, in search of a Report or a Notification, to establish a fact or to correct a date,—must have regretted the wasted time for which the absence of Indexes has been responsible. We have to plead guilty to our own impeachment, so far as regards the first series of the *Japan Times*, but we promise that it shall be amended in the second, and the best proof of our contrition is given to-day.

This is not the time to review the record of the past; the last pages of our second volume will be the fitting place for a sketch of this year's chapter of the history of Japan, but some slight reference to the progress made by the government and its people, as indicated by the subjects of the 'Leading Articles' enumerated in our Table of Contents, will not be altogether amiss. Prominent on the record, a blot upon the people's fame, is the hardly-dried stain of Okubo's blood. But for that terrible spot, the record would be fair enough. The Press Laws have been ameliorated, Currency Reform initiated, Forestry Laws have been passed; an improved plan of keeping the national accounts has been adopted, the Silk Trade has been freed from a number of petty and vexatious restrictions, a bold experiment is being made with a view to improve the production and to extend the market of another great staple—Tea: the Navy has been greatly strengthened, and an attempt has just been made to improve the administration of the great national line of merchant steamers; the Postal System has been extended, and a number of new offices built, and the control of the whole Telegraph system has been taken over by Government; and,—most important step of all,—the first seeds of representative Government have been sown in the shape of the Provincial Synods whose establishment we recorded only a month ago. These are long steps of healthy movement, and, were the half-year's record undefaced by the murder of the statesman who originated or suggested most, and himself conducted many of them, it would have been fair indeed. The country had hardly yet recovered the convulsion of last year's rebellion, when the very existence of the Government was threatened, and Anarchy's baleful shadow threw a gloom over the land; and that such concessions should have been made as those we have enu-

merated is highly creditable to the Cabinet, as evidencing both courage and sagacity; while all friends of the country may also take them as a proof that the Mikado's advisers feel secure in their position, and that our trade has no political change, no counter-revolution, to dread.

This Index serves, for us, another purpose. It does not become us to review our own work, but to this we may silently point—and ask our readers to judge for themselves how the promise of our first number has been fulfilled. We may, we think, also undertake—with some confidence that we shall be believed—that as this Review has been commenced, in the same spirit it will be continued. Not slavishly flattering the rulers of the country, not unsympathetic to the aspirations of the ruled, the *Japan Times* will continue to give an independent support to those, the best counsel at its command to these. It is most gratifying to know that already evidence has been given that its work in this direction has not been altogether in vain: and we look forward with hope, not wholly unsupported by belief, that the time is not distant when—a closer connection being permitted between the native and foreign press—it will be in our power to give far more effectual aid.

That the etiquette of the Press prevents us from doing more than mention another group of lines in the Table of Contents presses sorely upon us. How lovingly we should linger over our re-perusal, how elaborately we should polish our review, of Captain Brinkley's 'Ishikawa Goyemon,' we may not say. The splendid contrast of the reckless bandit's deeds, with the delicious, sensuous, artistic life of calm in the Palace of Pleasure—Goyemon's magnificent courage, whose blaze hides from sight so many a crime,—Bansaku's devotion—Chiyo's love; the dark perfidy of Ishida Mitsunari, the complex puzzle of Hidetsugu's character, the plot and its failure—the vengeance and its remorse; the careful archaeological studies, the interesting historical portraits; the slight sketch of Iyeyasu, the fuller picture of Taiko and his Court; the minute analyses of character and emotion, the descriptions of scenery, so graphic that, as the reader scans the page, he trembles at the roar of the hurricane, or sees the round red moon slowly rising through the mist upon the lake; all woven together by the hand of such a master and on such a splendid warp of diction, that the finished web glitters like Japan's own gorgeous brocades—to review a book like this would indeed be a labour of love. But we must leave the task to other hands.

The other divisions of our Index we may dismiss with brief mention. Our Law Reports, we are glad to know, are appreciated, and we believe that the selections we have made from the Japanese Press have been thought interesting. In our Commercial Tables and Reports we are yet far behind what we hope to achieve; but our public is aware of the mechanical difficulties under which this first volume has been created, and due allowance will be made. The necessary plant has been ordered from England which will enable us to enlarge the Review and, we trust, make it more valuable to commercial men. And with the aspiration that we may be successful in doing this, as also in catering for other classes of our readers, we place our first volume in the hands of the community, leave to their appreciation the labour of the past,—and with, we hope, a not unjustified confidence, await their support in the toil of the future.

EDITORIAL NOTES.

IT must constantly have occurred to those who see the scars left in the banks of the Creek by such accidents as that to which we have referred in our leading columns, to wonder by what rule they always occur at night, as they apparently do, and why serious accidents do not often

attend the fall of the earth. The following account of another landslip, which occurred a little way from the settlement, which we take from the *Gazette*, shows that this immunity is not always to be depended on. Our contemporary says:—

"A covered drain is in course of being made by a Government contractor down the slope leading from the English and American Naval Hospitals, past the Spring Valley Brewery, to the lower part of the village of Itagaki. At one point, close to the pond on Messrs. Copeland and Wiegand's property, the drain is led through a hard compact stratum of gravel, above which is a layer of soft earth. The top of this, crowned with trees and shrubs, overhangs the work at a height of some thirty feet. Not only was no precaution taken by the contractor to prevent the falling in of the upper surface, but the cutting was carried on in precisely the manner often employed to produce what miners call a fall, namely, by working directly into the lower part of the face of the bank. Yesterday, loosened by the rains, down came a large portion of the bank while two men were at work in the drain. One appears to have had notice of the swift calamity just in time to escape 'with the skin of his teeth.' The rattle of loose earth alarmed him, and he had swarmed partly up the opposite side of the drain, when he was caught by an avalanche of earth, stones, trees, roots, and bushes, which buried him from the shoulders downwards. His head alone was visible when his companions and others rushed to the spot. They soon extricated him; and, though he was badly bruised and squeezed, yet he is said to be in no danger of his life. The other unfortunate had entirely disappeared under the slip, and as this extended over a length of several yards, and his whereabouts could only be surmised, half-an-hour elapsed before the eager rescuers, of whom there were about a hundred, working, all honour to them, with feverish zeal, unearthed his body. This, quite dead, was, at length, found three feet below the surface. The man had been caught by a large root which jammed him against the side of the drain, where he had evidently been stifled by the mass which covered him. The appearance of the corpse and the expression of its face lead to the belief that death must have been sudden and easy. None the less was the deceased a sacrifice to carelessness, or greed, or both; and we sincerely hope that the Kencho will order an inquiry into the circumstances of the accident. It is perhaps well for the contractor that the investigation, if any be made, will not be carried on before a British coroner and jury."

This, of course, is an accident resulting from pure ignorance,—the most crass stupidity, in fact,—but in the case of the Creek wall, the local authorities cannot plead even this sorry excuse; for the proper way of building retaining walls has been repeatedly pointed out to them, and when their persistence in a faulty system results in a fatal accident to some foreigner, a very good diplomatic claim for damages may be set up. The Japanese set the lives of their own people at a low rate, but foreign governments estimate those of their citizens at a high figure.

WE have again, for the same reason as that given last week, to load our 'Japanese Press' columns with articles from the native papers on Currency. Our readers have to thank the accident that our translator is incapacitated by sudden illness, that they have not to wade through a couple more. One of our native contemporaries of the capital has at last taken up the argument which we have been so persistently presenting to the Japanese mind, that the Trade Dollar of 420 grains is too heavy and that it must be reduced to the same weight as the Mexican to prepare it for the race for public favour in the East. We regret that we are unable, to-day, to print a translation of this article: we are glad, however, to be able to record the fact that it has been written, as an indication that Japanese financiers are gradually becoming educated in, at least, the rudimentary principles of finance.

THE *City of Tokio*, we perceive is, advertised to leave for San Francisco at 3 p.m. on Monday next, instead of at daybreak, as heretofore, and the Post office will consequently close at 1 p.m. With the exception of tea firers and tea-packers, therefore, it will not be necessary to work

on Sunday either during the day or night, and the Agent of the Pacific Mail Company deserves the thanks of the Community for so promptly acceding to its wishes in this respect, as expressed in our own columns, and in those of a contemporary, last week. We have, ourselves, all the more reason to acknowledge the favour, as our duty has appeared to us to compel our taking the Company to task on another score in our leading columns. We regret that we have not space, to-day, to address also a few remarks to the merchants who compel the Sunday labour which in the old days of Yokohama was unheard of, and which is now assuming the proportions of a scandal and a disgrace to a community of men calling themselves—at all events—'Christians' dwelling among the Heathen. The columns of a newspaper are not the proper pulpit for such a sermon as might well and fairly be preached on the subject; but there are economic and hygienic arguments enough to bring against the practice to condemn it utterly, and some of these—on an occasion when time and opportunity serve—we shall take leave to adduce.

SO much has been said, written and legislated at home in vain against the wicked merchants, middlemen, and grocers who have mixed, adulterated, and generally bedevilled the pure Chinese leaf which is the source of that 'cup which cheers and not inebriates,'—that the following Proclamation by the acting Lieutenant-Governor of Fuhkien comes to the soul thirsting for pure tea with a very refreshing force and deserves the gratitude of every woman in the United Kingdom. The vigour with which His Excellency denounces these counterfeiting "villains" who mix willow leaves with those of the tea shrub, and his just horror at the misdeeds of "these seditious and dishonest scoundrels," together with his offer of so large a sum as \$100 for the arrest of any one of them, are highly admirable, and fully sufficient evidence of his justice, uprightness and sincerity; while that mercy, which should always temper justice, is displayed in equal measure by his promise to pardon and overlook what has gone before, should these evil-doers turn over a new leaf (strictly plucked from the tea shrub) and "wash their hearts and strip the skin from their faces." We take our translation of his characteristic Proclamation from the *Foochow Herald*:—

"I, Pao, by Imperial Appointment Acting Lieutenant-Governor of Fuhkien, issue the proclamation below for the arrest [of certain offenders].

"Whereas information has reached me that lately certain counterfeiting villains, knowing the difficulty of detecting the admixture of young willow leaves dried and prepared, with genuine tea,—are, in their greed for gain, only awaiting the arrival of the new season's tea to make this admixture.

"Whereas moreover the new season's tea, will shortly be pouring into Foochow in all directions from the various tea districts, the immediate apprehension [of the above mentioned malefactors] and the suppression [of the fraud] is much to be desired, to the end, that the guilty may be punished and the merchants protected.

"Therefore, besides giving orders for a rigid and secret search for and punishment of [the offenders], I issue this prohibitory proclamation to inform all classes that these seditious and dishonest scoundrels are uniting together to make false tea with a view to defrauding the merchants and to damaging [the trade]. Their crime is therefore very great.

"Any of their accomplices who may repent of their past misdeeds, and wish to turn over a new leaf (lit: wash their heart and strip the skin from their face), I am willing to pardon, and to overlook what has gone before. But if, after this Proclamation has been issued, they continue to offend and will not change their conduct, when complaint is made of them or they are discovered and brought up for trial, I shall assuredly give instructions for an augmented punishment and will not abate one jot of it.

"I am informed that the persons in Foochow who are at the head of this fabrication of spurious tea, are few in number; if therefore any man can bring one of them bound to my Yamen, and the accusation prove to be true, a reward of \$100 will be given. Any person laying an information against one of these principal offenders will, on its being verified, receive a reward of \$50. Nevertheless, people must not, to gratify a grudge, bring false accusa-

tions,—should this happen the informer shall himself receive the punishment.

"Let all, trembling, obey without fail.

"A very important Proclamation!

"10th May, 1878.

We should not omit to mention the fact that to H. B. M. Consul at Foochow was primarily due the Governor's action: and that a similar Notification is to be issued by the heads of departments in the outlying tea-districts.

"WE UNDERSTAND," says the *Friend of India*, "that the Government of India anticipates that the gross receipts of the Forest Department for 1877-78, will aggregate Rs. 65,52,500, and the expenditure Rs. 45,67,350, leaving a net balance for the year in favour of the State of Rs. 19,85,150. Compared with the regular estimate for 1876-77, there is expected to be a falling off under all three headings, and a considerable diminution of receipts, but an increase of expenditure compared with 1875-76. This is owing to the receipts for that year being exceptionally high, especially in the Punjab and British Burmah, while the expenditure was less than that estimated for either of the two following years. Referring to the operations of the Department for May, June, and July last, and commenting on the above facts, the Secretary of State remarks:—The areas of forest at present reserved and demarcated throughout India bear but a small proportion to what it is hoped may eventually be taken up by the Department; and as these are annually extended, it may be expected that the expenditure required for their conservancy will also increase. It is undoubtedly desirable that this increase of cost should be covered by receipts from the sale of forest produce, and under careful management this will no doubt be the case; at the same time it must be borne in mind that the present operations of the Department are more with a view to the protection of forests from destruction, and the extension of their resources so as to meet the increased demands that may be expected to be made on them in the future, than for the purpose of present revenue. Some day, however, it may be hoped that the State forests will contribute to no inconsiderable extent to the resources of the Empire."

The Japanese Government should take this lesson from the Indian. Though, indubitably, State forests, in course of time, will become a source of profit—the chief end in view is not direct receipt of money from them, but indirect benefit to be derived by the people generally, in improvement of climate and soil, and the prevention of scarcity, floods and general damage. And if a Government cannot make profits immediately out of its forests, neither is it to be expected that private forest-planters can do so: and therefore terms on which land is let for this purpose must be very liberal,—far more so than those announced in the Forestry Regulations we published some time ago.

NOTICE TO CORRESPONDENTS.

No notice will be taken of anonymous correspondence. Whatever is intended for insertion in the JAPAN TIMES must be authenticated by the name and address of the writer, not for publication, but as a guarantee of good faith.

Manuscripts found unsuitable for our columns will be carefully returned to the writers.

YOKOHAMA: SATURDAY, JUNE 29, 1878.

BIRTH.

On the 24th inst., at No. 61, Main Street, the wife of A. T. WATSON, of a son.

NOTES OF THE WEEK.

FRIDAY EVENING, June 28 1878.

THE *Orissa*, with the London mail of May 10th, arrived last Saturday as we were going to press. A mail from Hakodate and the *City of Tokio* from Hongkong are the only other mail arrivals during the week; the latter vessel is advertised to sail for San Francisco at 3 p.m. on Monday next. The *Tanis* with a London mail of May 17th, left Hongkong for this on the 23th inst.

The *Volga* left on Wednesday morning last, with a mail due in London, August 19th. An outward Shanghai and way-ports and a Hakodate steamer, completes our mail intelligence.

We have to note the fastest run on record from Hongkong to this port, which was made by the *City of Tokio* on her last trip; the passage between the two ports, 1,613 miles, was made in four days, nineteen hours and twenty three minutes, thus beating the previous best run (which was made by her sister ship the *City of Peking* in four days, twenty-one hours and thirty-five minutes) by two hours and twelve minutes.

H. E. Dr. Elmore, Peruvian Envoy to China, Japan and Siam—and his Secretary, H. E. the Minister from China to the United States and the newly appointed Chinese Consul-General to San Francisco, and their respective suites, were passengers by the *City of Tokio*.

Our readers will be glad to hear that the P. & O. Company have not had to suffer a total loss of their fine steamship *China*. We quote in other columns, from the *Bombay Gazette*, an account of her being lifted from the bed of mud in which we left her a fortnight ago. But this must evidently have been an expensive process, as will be that of refitting her, and, coming as it does in the same half-year's accounts as the *Khedive's* collision with the *Voorwards*, it is hard on the share holders. So excellently are the vessels managed, however, of this deservedly popular Company, that accidents like these are happily rare.

The news from home is truly difficult to understand, as transmitted by the 'Baron.' In the same telegram we are told that Russia, England and Austria are agreed regarding Bulgaria—and yet that 'the concurrent attitude and understanding between England and Austria regarding Bulgaria have not attained their desired views,'—whatever such an enigmatic and involved sentence may mean. And both statements are unofficial, the former quoted from the *Times*, the latter from some other paper, or mere gossip; declaredly, at all events, unofficial. Between them is sandwiched a statement which bears the stamp of truth, and which appears to have been published officially—that Earl Beaconsfield insists on Russia withdrawing her troops from Constantinople as a *sine qua non* to the continuance of the Conference. Considering that we heard, some days ago, that they had been retired to a position some distance from Constantinople, this again is puzzling, and the Tsar's reply,—making their withdrawal conditional on administrative autonomy being granted to those Provinces south of the Balkans wherein are no Turkish troops—hardly appears like an answer, or to have anything to do with the question. The Provinces to which this would apply are those to the west, north of Greece. We can only await further developments—or the solution of this worse than acrostic puzzle in Baron Reuter's next.

A little more light, it is true, is thrown on the position by the telegrams which arrived from Hongkong by the *Tokio*, telling us as they do that the Russian forces were thought by Lord Beaconsfield 'dangerously near' the Turkish capital. And the 'agreement about Bulgaria' probably finds the key to fit it in the message that it is to be divided into two parts—that North of the Balkans to be independent, and the South autonomous;—though we confess to thinking this rather a distinction without a difference. Is South Bulgaria to remain tributary to the Porte?

In common with our countrymen all over the East, we hailed with delight Lord Beaconsfield's vigorous move of sending troops from India to the Mediterranean, and,—a fortnight or so ago,—we gave some particulars of their rapid and successful dispatch from Bombay. The last mail brings us the news that the majority of the transports had got through the Red Sea, but not, of course, without a small percentage of accident and trouble. The *Clydesdale*, a telegram from Suez informed the *Bombay Gazette*, was detained there in quarantine, having cholera on board. A very graphic letter dated Aden, May 8, from a special correspondent of that journal, draws a striking picture of the discomforts and dangers of a voyage in a ship went to sea without sufficient time for preparation. When she was taken up as a transport in Bombay, she had 500 tons of her previous cargo of coal still on board, and, this having to be got out, and a battery of horse artillery having to be got in, with all the water-tanks, stable and other fittings and other furniture of a troop-ship to be put into her—and all in six days—it may well be imagined that she went to sea in a pretty mess. Unfortunately a case or two of cholera occurred in the battery before the men were embarked, and in the belief that the change of air would check the disease, the ship was hurried to sea. Four fatal and six other cases occurred in the course of the voyage; and she had to be detained as above stated, at Suez. Two or three other vessels met with accidents, too; the *Sat. Oryth's* machinery breaking down twice, and the *Tobacco* taking fire, and subsequently having to part company in the

Red Sea with a buggalow she was towing, full of baggage horses and forage. Generally, however, all seems to have gone well.

But the excitement over, of the dispatch of these five or six thousand men, and some part of the effect of their presence in Europe having been discounted by Reuter's meagre telegrams—(for there seems little room to doubt that to their appearance was chiefly due Russia's consent, at the last moment, to submit the Treaty of San Stefano to an European Congress for endorsement or change)—now arises in the minds of Englishmen the conviction that, though Earl Beaconsfield may have saved the nation from war, and saved it with honour, he has done it by straining the prerogative of the Crown, if not violating the constitution. The subject is too large and serious a one to treat in this small type, but it is a historical fact, that the preamble of the Mutiny Act,—passed from year to year solely to assert Parliament's right to control the power of the Crown to levy troops—is simply one of the clauses of the Bill of Rights, on which our liberties rest. Also, that the order for these troops to move was sent to India the day after Parliament rose for the Easter Recess. Also that the House of Commons, some weeks before, had voted Six Millions, just as a mark of confidence, without any distinct information as to what was to be done with the money. The 'value of these observations lies in the application of 'em.' If the Earl brings us triumphantly out of Congress without war, and without disgrace, and yet with British interests safe and European peace secure, (large 'ifs') he will get his Act of Indemnity passed without trouble; if he fail, few Ministers, we should imagine, will have been nearer impeachment, in these days when impeachments are rare. The question, we see, has been debated in the Lower House, on a motion of Lord Hartington's, and the Government, treating this as a vote of want of confidence, of course got a majority—349 to 226. But this was very different to the vote on the division on the Address, thanking the Queen for calling out the reserves—319 to 64—and the difference is most significant. In the Lords, the Earl simply declined to defend his policy at all—on the ground that what he had done required to be done as a move in his general policy—and the Lords appear to have accepted his dictum. This is all very well for Englishmen who know their country and their countrymen, and are familiar with the working of Parliamentary institutions; but to other people, such a division in the Lower House on such a motion must necessarily encourage the belief that England is 'a house divided against itself'—and it seems possible that much of the good done by the move of the troops may be neutralized by the harm done by the vote.

It is simply impossible to avoid straying into European politics at such an exciting time as this,—resolve against the bad practice as we may.

Affairs remain pretty quiet here. A rumour was mentioned by one of our daily contemporaries that Ito Hirobumi was fired at while walking in his garden and also that an attempt had been made to assassinate Watanabe. The *Herald* states that the circumstances were reported to it by official informants, who should know, but does not vouch for the truth of the statements. We are in a position to state that, happily, the first rumour at least has no foundation in fact; nor have we the slightest belief in the other. Reports of this nature are invariably rife after the occurrence of such a deed as that which deprived the Mikado, last month, of the 'right arm of his government.'

If there be any truth in the rumour which has been so current lately that a conspiracy to rebel against the Government has been lately discovered in Tosa, which accounts for the numerous arrests of Tosa men, the secret has been better kept than is usual in Japan. That a number of arrests have been made is true enough, but they are, we are assured, all for complicity with the Satsuma rising, and in no way connected with any new plot. Had Saigo succeeded in escaping from Kiushiu to the main land, he would have been welcomed with open arms by the Tosa men. This is certain now, as it was strongly suspected at the time; and Government is merely making a few arrests on this old account, on proofs which have been for a long time in its hands. We are glad to be able to say that there is not a word of truth in the rumour of Goto Shojiro's complicity with this plot, and consequent arrest. He has not been in Tosa for years and has quite cut himself loose from provincial politics. That trouble of some sort, however, is feared by the government is clear from the assembly of war lords very like a council of war in Osaka in the middle of the month, at which Generals Tani, Mura, and Shijo, each in charge of a northern division, and the Governor of Kioto, Sakaye, Higo, and Osaka, were all present to confer with the War Minister, whose departure for that city we noticed last week. Another significant fact is that the *Force* of Kuwanaoto now always moves under military escort.

The progress of the Press in this country is evidenced by a fact mentioned by a native paper, that nearly a hundred applications for licenses to publish have been made since the beginning of the year, of which two thirds have been granted. Another use of paper is as well understood and practised: over a hundred National Banks, all issuing paper money of their own, are now in existence. No wonder that the Printing bureau is in a flourishing condition and requires so large a plant as that described by the *Japan Herald* a few weeks ago.

We are extremely sorry to note, in two or three of our native contemporaries, the statement that cholera has reappeared in Tokio. Two cases are reported, but as no diagnosis has been made by any foreign physician, we may hope that green fruit is at the bottom of the business. Nevertheless, the warning we published two or three weeks ago, respecting the drainage of foreign owned compounds, ought not to be neglected.

From China we have a variety of interesting news, had we space to chronicle them. When an ambitious thought, which has long been waiting to be vivified into action, comes to birth, our limits will not be so confined. Meanwhile we must merely give mention to the fact that the text of a Convention between Spain and China has been published, whereby Chinese labour is permitted to be used in Cuba, and proper guarantees given for the protection of the labourers; and that Embassies from Peking to the United States, Spain and Peru, are on the point of being despatched, thus doubling the diplomatic staff of China abroad, her Legations being situate at present in no other capital cities than those of London, Berlin and Tokio. The armament of Hongkong has been completed and Volunteer Artillery-men are busy drilling to qualify themselves to aid in the defence of the island in case of need. We have not heard of the arrival of the *Shannon* there, but she must be now in the harbour. The *Charybdis* is in Hongkong, the *Nassau* left, it was believed, for this port, on the 17th inst. The *Iron Duke* is expected out, to relieve the *Audacious*, about the end of September and the *Curlew* and *Thistle* are ordered home at once. The Tea-Race seems to lie between the *Glenagles*, the *Loudoun Castle*, the *Glenartney* and *Ocean King*. The first has a long lead, having got away from Woosung fifty-two hours ahead of the *Loudoun Castle*, and having gained something on her in the run to Singapore. The last pair got away nearly together, on the 26th ult. arriving at Singapore, on the 5th and 6th inst. respectively, two and three days after the second, the *Loudoun Castle*. There appears to be more than enough excitement in China about this race and a great deal of gambling, double-selling lotteries, &c. This may be reprehensible, but one thing is quite certain,—that the contest does have the effect of steadily improving the build and speed of the vessels, as may be seen from the following record of the performances of the the winners of the last eight years' races.

1870	Erl King	61 days.
1871	Enterprise	56 "
1872	Deccan	50 "
1873	Venetia	50 "
1874	Glenartney	49 "
1875	Glenartney	46 "
1876	Glenartney	46 "
1877	Loudoun Castle	41 "

It will be seen that the *Loudoun Castle* is the present 'holder of the blue ribbon.'

Our own aquatic racing here has been of a less exciting character. Though the Regatta was uncomfortably prolonged, the members of the Club, at least, appear not to have had enough of it, for a match was organized for Wednesday last which, though not a new thing, produced a new result. For several years, six men have essayed to row the six-oared gig, and in her to beat a four-oared crew in one of the other boats. The first challenge came from the six-oar, to row a crew of four in the light London boat; and it was expected that the four challenged would not sit the boat. Since then the match has been made between six of the biggest—kakophonically called the 'beefiest' men, against a crew in one of the Canton-built fours; and skill has always beaten 'beef.' The race has, therefore, come to be thought annually a four-gone conclusion. But this year, two crews were picked, with a view to test the merits of the boats. The six-oar is a wide-beamed, in-rigged boat, which—in old days—manned by Japanese *scowls*, won a reputation for invincibility against aught but gold-bought pertily: the four-oar is one of the out-rigged, open cutters so well known as racing boats in the harbours of China and Japan. A close race was expected this time; the crew of the six being composed of stronger men, though the advantage was not thought more than enough to compensate for the bulk of the boat. The four was manned by no mean crew, their metal having

been proved in many a race in this bay. In weight, the crews averaged 11st. 1lb and 10st. 5lb. per man respectively. To the surprise of all, the four-oar made no show. The crews started at an even stroke, each rowing 30 per minute, and after the third stroke, the six began to draw away, and in 300 yards, had drawn clear. The stroke of the leading boat was then slowed down to 28, but still the boat continued to gain, and the four-oared crew falling to pieces, the race was finally won by 47 seconds; as, finding all chance of victory gone, the four-oar was not persevered with after the first half-mile. But under no circumstances should they have succumbed so easily. It is difficult to account for so hollow a victory of one scratch crew over another, pitted as they were against each other under such different circumstances. We have our own theory on the matter, but as we are not at present sure that it is the correct one, we shall not yet favour our readers with it. The following gentlemen composed the crews:—

1.—J. Lilburn,	1.—C. P. Hall,
2.—T. Richmond,	2.—H. O. Jeyes,
3.—F. Boyes,	3.—A. Milsom,
4.—G. W. F. Playfair,	A. H. Dare, stroke.
5.—J. J. Dare,	H. B. Henley, cox.....3
H. C. Litchfield, stroke.	
A. H. C. Haselwood, cox...1	

We are glad to learn that the Rowing Club are not to neglect their swimming lessons; a series of matches is announced, the first thereof to be contested on July 20th. While a Champion Cup will be given for the best long distance swimmer, and suitable prizes awarded to elegant 'headers,' the claims of those who can only 'calithump' will not be neglected.

The half-yearly meeting of the Yokohama Jockey Club, which was advertised for Thursday last, at the Gaiety Theatre, not having been attended by a sufficient number of members to form a quorum, has been postponed for a week. Evidently the Rules have given a fair amount of general satisfaction, since no grievance exists to get together the small numbers necessary to make 'a house.' But we must remind our readers that this first meeting is of importance, as a statement of the present condition of the Club is to be made, and, though—according to Rule 8, any number of members,—instead of the one-fifth requisite for the original,—make a quorum at an adjourned meeting—and, therefore, the meeting will take place next Thursday, though only half-a-dozen members attend; still it is as well that there should be a good attendance, as matters of considerable interest have to be discussed.

Our local 'dry bobs' are not very active, except at lawn-tennis. Cricket appears to languish, though in such a climate as this we ought to have matches every week. Even India is ahead for us. A Parsee eleven left Bombay at the beginning of the month, we believe, on a trip to England. A gentleman of their caste, Narsay Kessowjee, pays all their expenses. The writer has a lively recollection of the beginning of Parsee cricket in Bombay, nearly twenty years ago, when it was extremely rudimentary and by no means unattended with danger to the spectators. Much progress must have been made, to justify the dispatch of an eleven home with any serious intention, but the visit shows a certain amount of pluck on the part of our Indian fellow subjects that deserves the consideration it will no doubt receive there. We are not of those enthusiasts, however, who like to see our own home games played all over the world: each country, each climate, has its appropriate pastime, and no particular good can be done, for instance, we imagine, by the attempt to naturalize such a game as cricket in India, where exposure to the sun is not much less dangerous to natives than it is to foreigners. A terrible warning against the dangers of cricket in a hot climate will of course, occur to the minds of our English readers, in the great match between Mr. Alfred Jingle and Sir Thomas Blazo when the faithful Qwanka Sambo was sacrificed to our national game.

The local Government occasionally publishes statements of accounts of monies expended in making repairs to the streets of the Foreign Settlement. We should be extremely pleased to see a few *riks* spent to put the Main street of the native town in proper order. Foreigners are mainly interested in it as being the most direct way to the Railway terminus, and as the traffic on it is considerable, it has been worn into any thing but good order, being full of ruts and holes which, as one generally passes over them in a *jirikisha* at full speed, give, to a moderately heavy man, a series of jerks which are anything but pleasant. A very small expenditure would put the street in good order and, both from foreigners and natives who have to traverse it rapidly on their way to the station, the Governor would receive very grateful acknowledgment.

NOTES AND QUERIES.

QUERIES.

Qy. 8. Mr. Bramsen's interesting note on the relative values of coins in your issue of February 23th, leads me to think that he or some one else may possibly be good enough to clear up a few points which have frequently occurred to me:—

1.—Can any one say when, and under what circumstances, paper money was first issued in Japan? "Shosei" in your issue of March 9th gave a most interesting account of the Han paper money; and perhaps if there were a general issue before that, some other student may be able to do the same for it.

3.—Can any account be got of the regulations (if any) which governed coining under the feudal system? For instance, under what circumstances was permission granted to certain individuals to strike coins? This seems to have been done at various parts of the country, thus we have Musashi Ichibu, Suruga Koban, &c.

(Unanswered.)

X.

Qy. 10. Can any of your medical or other readers inform me of the recent existence of cases of poisoning resulting from the use of bread made from impure wheat: the symptoms being those described in works on Medical Jurisprudence, as arising from the presence of the *Lolium*

temulentum or Darnel grass (or other poisonous *gramineae*) viz; Gastro intestinal derangement, narcotism, vertigo and convulsions. (Unanswered.) R. N.

Qy. 11. Many of your readers, when walking towards the new cemetery, must have remarked the *tumuli*, about twelve in number, which dot the table land which lies above Ota on the one side, and the hill of Tobe on the other. These *tumuli* are religiously preserved from the spoiling of the farmer, and must have some history; are they the burying-places of heroes fallen in some old quarrel? Can any of year readers enlighten me?

(Unanswered.)

Qy. 12. In Jules Verne's work, entitled "Michael Strogoff, the Courier of the Czar," occurs a paragraph which touches upon the disposal of political exiles in Siberia. Speaking of their concentration at Irkutsk, during one of the Tartar invasions, he says "some are doctors, others professors, either at the Japanese school or at the School of Navigation." One does not of course, expect absolute accuracy in a novel, but is our ingenious author not a little adrift here! I shall however be glad to know if such an institution really exists.

(Unanswered.)

Qy. 13. The perusal of Dr. Doenitz's interesting paper on Cremation in your issue of June 15, suggests one or two questions which those better versed than myself in Japanese history, as well as in the history of this practice in Japan may be able to answer.

1. Is the rapid progress which Cremation is said to have made, wholly due to Buddhism? It seems to me that this can hardly be the case, because Buddhism was introduced about 552 A.D., and Cremation not, it seems, until nearly a century and a half after. Moreover, as we see in China, Buddhism can take a firm hold on a country which does not practice Cremation at all;—and it was not until about 500 years after its introduction that it was made compulsory on the followers of the Monto sect.

2. The reason assigned in Dr. Doenitz's paper for the cessation of the practice of burning the bodies of the Emperors viz: the representations of a fishmonger, although no doubt satisfactory to the native mind, will hardly recommend itself to an European. Can any one give the real reason?

3. When the practice was wholly prohibited a few years ago, was any reason given for this prohibition, or for its subsequent speedy renewal?

In his work on Japan p—437, Mr. Griffis after a description *mors suo* of the lotus flower, says:—"As the mortal body of the believer approaches the Cremation house, that the borrowed elements of his body may be liberated from their fleshly prison and returned to their primordial earth and air, a stone carved to represent a lotus-flower receives the bier." Further on, at page 513, he says that the process occupies only two hours, and that nothing revolting is visible. Having myself been present at about half a dozen cremations in one or other of the places set apart for this purpose in Tôkiô, I can bear witness to the correctness of Dr. Doenitz's assertion that it occupies seven or eight hours; and I must confess to never having seen anything at all resembling a stone-lotus on the premises. It would be interesting to know whether in the interior (Mr. Griffis is describing the process as seen at Fukui in Echizen) different arrangements are made to those in Tôkiô, where the process is certainly most revolting to ordinary individuals.

In the subsequent short conversation on Dr. Doenitz's paper, some doubt was thrown on the possibility of producing the desired result by such simple means. In Eassie's very interesting work on Cremation, an account is given of the manner in which it is at present performed among the poor in India, and the process seems quite as simple as that employed in Japan. It is said however to cost in the neighbourhood of Poonah about 25s., whereas in Japan the lowest class costs only 3s. Among the North American Indians also the process seems even simpler than in Japan.

The practice of removing the intestines mentioned by one of the sneakers, is not at all uncommon. In the work above referred to, an extract is given from an article in Lippincott's Magazine, the author of which observes that

even among the better classes in Siam the intestines are removed from the corpse before cremation is performed.

If I had not already been wanting to know so much, I should have asked some of our Japanese scholars to be good enough to tell us whether there are traces in Japanese literature of any other mode of disposing of the dead here besides interment and cremation. The Ainos sometimes practice, I believe, dessication.

Y.

THE BEAUTIFUL MAIDEN OF PAO.

A TALE FROM THE HISTORY OF CHINA IN THE 8TH CENTURY BEFORE CHRIST.

TRANSLATED FROM THE CHINESE BY C. ARENDT.

CHAPTER II. THE EMPEROR HSUAN.

THE EMPEROR YU. THE BEAUTIFUL MAIDEN OF PAO.
THE GAME WITH THE WOLF'S SMOKE.

WE HAVE related how the souls of Tu-po and Tso-ju appeared to Hsüan-wang during his hunting expedition in the Eastern plains, and how he was forced to return to his palace ill. As soon as he closed his eyes, he fancied he saw Tupo and Tsoju before him, and he knew right well that he would never recover. He refused to take medicine, and after three days, his illness grew more serious.

At this time the Duke of Chou was in retirement and Chung-shan-fu was dead; Hsüan-wang therefore called the gray-headed Yin-chi-fu and the old Shao-h'u to him, in order to entrust them with the charge of the heir to the throne.

The two men came to the bedside, threw themselves on the earth and greeted the Emperor. The latter ordered the eunuchs to raise him in the bed, and leaning on the pillow of embroidered silk commenced:—

"Relying in the wisdom of my true servants, I have reigned for six and forty years. I carried my victorious arms to the south and the north, and I gave peace to the four seas (1). I am now sinking under a sudden illness. My son, Kung-Nieh, who inherits the throne, is already of age, but his mind is not yet mature. In you, my faithful servants, I place my trust that you will help him in the task of governing, so that the glory of the Empire may not fade."

The two bowed their heads to the earth, took the order, and left the palace. At the door they met the Imperial Astrologer Poyang-fu, and Shao-h'u said to him privately:—"When I heard the song of the children I said that a misfortune by means of bows and arrows, hung over the country. The Emperor has now seen the souls of his victims shoot at him with a red bow and arrow. What I said has been accomplished. The Emperor will certainly never rise again from that bed."

Poyang-fu replied

"I questioned the stars last night, and saw Yao-hsing (i. e. the star of demoniac influence) stand in the centre of Tszewei.* Greater complications threaten the land. It is not yet finished with the death of the Emperor."

Hereupon Yin-chi-fu said "Man is subject to the will of heaven, but man can with a strong will force heaven. If we think on nothing but the ways of Providence, and quite forget the affairs of earth, then the three Imperial Councillors, and the six Ministers may as well resign their offices."

The three then separated.

Soon after, when the crowd of officials thronged round the door of the palace to inquire about the health of the Emperor, and heard that His Majesty's condition was very critical, they did not venture at first to return to their home. And indeed the Emperor died the same night. The Empress Chiang immediately issued an edict calling to her the old statesmen Yin-chi-fu, and Shao-h'u, who had been intrusted by the late Emperor with the care of the heir to the throne, and putting them over all the officials, directed them to see to the conduct of the mourning ceremonies, and of the installation of the young prince.

Then the Crown-prince Kung-Nieh ascended the throne on the coffin of his father. He is known in history as Yu-

(1) The four seas i. e. the world.

* A constellation which stands in especial relation to the Emperor]

wang (782-761 B. C.) The new Emperor proclaimed soon after that the next year was to be regarded as the first of his reign. His wife, daughter of the Viscount of Shên(1) became Empress, and one of her two sons named Ichu was named successor to the throne. The father of the Empress, the Viscount of Shên, was promoted in rank and received the title of Count of Shên.

The Imperial historiographer has celebrated the Emperor Hsüan in the following verses:—

"Great was the Emperor Hsüan
His fame filled the earth
The most distant lands feared his might.
He overthrew anarchy, and established order in the land
Chung-shan-fu and the Empress Chiang
Stood loyally by his side in the foreign and domestic affairs of the land.
Thus he knew how to repair the errors of his father, and to renew the glory of his house. (2)

The Empress Chiang was so grieved at the death of her husband that she soon after died also. The Emperor Yu was cruel, merciless and unprincipled. Even during the period of mourning for his father, he associated with a crowd of debauchees, and ate meat and drank wine, without showing the slightest signs of grief. After the death of the Empress Chiang he knew no fear or restraint any more, but gave himself up completely to the pleasures of bad music and sensual gratifications. He cared nothing for government. The Count of Shên frequently made representations to him on this account, but as he was not listened to, he returned to his own land of Shên.

The end of the glory of the Western Chou was approaching. The old and faithful servants Yin-chi-fu, Shao-h'u and others died off one after the other. After their deaths the Emperor appointed the Duke of Kuo, the Duke of Chai, and a son of Yin-chi-fu, named Yin-ch'u to be his Councillors(3). These three men were intriguers and flatterers, office-seekers, covetous, and ready to do whatever the Emperor willed. The single good man at Court then was the Viscount of Chêng, (4) named Yo. He was then head of the department of worship and ceremonies, but the Emperor cared little for him.

One day, as the Emperor was holding an audience, news came from the Governor of Ch'ishan that earthquakes had taken place on one and the same day at the three rivers Ching, Ho and Lo.

"The fall of mountains and the quaking of the earth" said the Emperor Yu, laughing, "are every day occurrences, why is it necessary to inform me of them?" Having said this, he returned to the palace. But the Imperial Astrologer Poyang-fu took the Imperial Councillor Chaoshu-tai by the hand and said, sighing:

"The three rivers Ching, Ho and Lo rise in the mountains of Chi, and this earthquake means something. In olden times the rivers I and Lo dried up, and the Hsia dynasty fell; the river Ho dried up, and the Shang dynasty fell. Now an earthquake takes place on the banks of all three rivers; in consequence of this the springs of all three will be obstructed, the rivers will dry up, and the mountain will collapse. In mount Ch'i (5) is the place where Prince T'ai had his residence. (6) If this mountain falls in, misfortune must come on the house of Chou."

"If," replied Chaoshu-tai, "misfortune hangs over the land, tell us when it will come on."

(1) Shên is a small principality in the southern part of the present Honan.

(2) The European reader perhaps does not find these encomiums to be accordance with what he has read above of Hsuean-wang. It must however be remembered that the author of the "History of the Principalities" begins first with the 39th year of the Emperor Hsuean, and only recounts the latter and least brilliant years of his reign. The most essential point is, that Hsuean-wang knew how to keep order among the feudal princes.

(3) There were at this time three councillors; they were called the "three Kung" (San Kung).

(4) Cheng was the name of a principality of which we shall afterwards hear more. It lay in the present Honan.

(5) Ch'ishan, that is the neighbourhood of Mount Chi. It was the birthplace of the Chou dynasty. Wenwang, the father of Wuwang, the founder of the dynasty, lived there. Ch'ishan lay in the South-western part of the present Shensi.

(6) The prince of T'ai or T'aiwang was the ancestor of the house of Chou.

Poyang-fu raised his ten fingers in the air and said: "It will not keep away for more than ten years."

"How can you know that?" asked Chaoshu-tai? When "the cup of good is full" said Poyang-fu, then come blessing. When the cup of evil is full, then comes misfortune. Ten is the complete number."

"The Son of Heaven (1)" cried Chaoshu-tai "cares nought for government, and worthless persons fill the highest offices. My duty however is to speak. I will do my duty and remonstrate with the Emperor in person."

"My only fear" said Poyang-fu "is that your words will have no result."

Meantime the long private consultation of both had attracted the attention of the bystanders, and news of it was carried to the Duke Shih-fu of Ko (2). Shih-fu feared immediately that Chaoshu-tai would make representations to the Emperor, and expose his worthlessness. He betook himself therefore at once to the palace and informed the Emperor of the private consultation of Poyang-fu with Chaoshu-tai, and added that they irritated the people by calumniating the Court.

The Emperor said:—

"When idiots converse about affairs of state it is of no more importance than when vapour ascends from the heath. There is no necessity for taking any notice of it."

On the other hand, Chaoshu-tai, animated by a noble zeal for duty, desired often to advise the Emperor, but he found no opportunity for so doing.

After some days a memorial came from the governor of Ch'ishan saying that all three rivers were dried up, and that a landslip in which a great number of people were destroyed, had occurred. Yuwang troubled himself little about all this, but ordered some more maidens to be procured for his seraglio. The Chaoshu-tai presented a written memorial in which he said: "Mountains collapse and rivers dry up—the bowels of the earth are agitated—heights fall and plains quake—these are all evil omens for the land. The neighbourhood of Mount Ch'i is the birthplace of the Imperial house; when this mountain falls down in a single day it is no unimportant matter. If now pains are taken with the government of the country, care applied for the welfare of the people, and good men chosen for Counsellors, we may still hope that the threatened dangers will be removed. But what can happen when the Emperor seeks, not for good men, but for beautiful girls."

Upon this Ko-shih-fu said "It is now a long time since T'eng-H'ao was chosen for the permanent Capital of the land. The neighbourhood of mount Ch'i is no more to us now than old shoes which have been cast away. What has Ch'ishan to do with us? Chaoshu-tai has never shewn the Emperor due reverence, and now he seeks pretexts to spread his calumnies abroad. I hope that my prince will not allow this to pass."

"Shih-fu is right" said the Emperor.

Chaoshu-tai was therefore deposed from office and banished from the city. He sighed and said: "People are careful not to enter a country which is going to ruin; in a state where anarchy rules, people will not reside. I desire not to await in inaction the time when wheat will grow where now the brilliant capital of the house of Chou is."

Saying this, he went to the land of Tsin where his descendant attained high honours. Chao-tun was descended from him, subsequently the families of Chao and H'an separated in the land of Tsin, when they were broken up into three parts, and became Chu'hou (feudal princes),

"The loyal servants of the Crown fleeing from anarchy went first towards the north. (3) Later, when misfortune came on people went towards the east. From the most ancient times it has been the duty of the sovereign to esteem and honour his faithful servants; for, when good men flee away, the land becomes destitute."

Now it came to pass that just at this time the Councillor of State Pao-hsiang (4) came from Pao-ch'eng to the capital.

(1) That is, the Emperor.

(2) Shih-fu is the name of the Duke of Ko, and he is therefore called farther on Shih-fu, "the duke of Ko," and also Ko-shih-fu. He was, as already mentioned, one of the three counsellors of the Emperor Yu.

(3) Tu-po's son also went to the land of Tsin, which lay north of the capital.

(4) Pao-hsiang i.e. Hsiang of Pao. His name was Hsiang, Pao was the possession from which he derived his revenue. Pao was the name of the neighbourhood of Pao-ch'eng.

When he heard of the banishment of Chao-shu-tai, he made representations to the Emperor and said:

"If my prince heeds not the warnings of Heaven, and banishes his faithful servants, it will be evil with the Empire, and the guardian deities will turn their backs in the land."

The Emperor grew wrath at this, and threw Pao-hsiang into prison. Henceforth no one dared remonstrate with the Emperor, and good and patriotic men gave up all hope of a return to a better state of things.

We will now however turn to something else.

As related in the last chapter, the man who had sold the bows of mulberry and the quivers of Chi, went to Pao with the child whom he had taken from the water, in his bosom. It befell now that he wanted milk for the child; and it happened fortunately that the wife of a certain Sze-Ta had just given birth to a girl which had died immediately. The bow-seller therefore presented a few pieces of cotton cloth and the like, and begged her to adopt and rear the infant. The child consequently received the name of Pao-sze.

Pao-sze grew up, and when she was only fourteen years of age, she made an impression as if she were sixteen or seventeen, and looked like a fully grown girl. She had large eyes, and fine eyebrows, red lips and white teeth; her hair resembled a black cloud, her fingers were like jewels artistically cut. She resembled a flower, her face was lovely as the moon, and her beauty was sufficient to bring ruin on lands and cities. But Sze-Ta lived in the country, and Pao-sze was still young in years, and so it was that in spite of her enchanting loveliness, she was still unmarried.

Now it happened that one day the son of Pao-hsiang named H'ung-Tê went into the country to collect the land rents. By chance Pao-Szê stood just before her door drawing water, and, although her costume was that of a peasant, it could not conceal her unequalled natural loveliness. H'ung-tê was excessively astonished to discover such striking beauty in such a miserable village. He then remembered how his father was now three years in prison, and reflected on what might occur if he made a present of this girl to the Son of Heaven. He might in this way perhaps obtain pardon for his father. He enquired in the neighbourhood about the relatives of the maiden, and on his return home said to his mother:—

"My father's only crime is that he made representations without any reserve to the Emperor. That is no unpardonable sin. Now the Son of Heaven is given up to sensuality and is unprincipled; he therefore wants to collect as many beautiful maidens as possible in his seraglio. The daughter of Szê-ta is of a most unusual and perfect beauty. If we purchase her, whatever it may cost, and make her a present to the Emperor, the result may be that my father would be released from prison."

"If this plan" said the mother "could really be set going, I should not care about the price. Let it cost what it will,—but you had better lose no time."

So H'ung-tê betook himself in person to Sze's house and there agreed with Sze-ta for a price of three hundred pieces of cloth and silk. After he had purchased Pao-Szê in this manner, he took her home with him, washed her in sweet-smelling scents, fed her with the finest food, dressed her in the most magnificent clothes, and instructed her in the usages of good society and then went with her to H'ao-ching. Having arrived there, he brought presents of money to the Duke of Ko, and moved him to say to the Emperor:

"Pao-hsiang himself now sees his offence, and knows well that he has deserved death 10,000 times. His son H'ung-Tê, impelled by filial love, and as an atonement for his father's sin, has brought a beautiful maiden named Pao-sze to the town, whom he wishes to present to your Majesty, in the hope of obtaining pardon for his father."

When Yu-wang heard this he ordered Pao-sze to be brought immediately before him. After the formalities of greeting were over, Yu-wang look steadfastly at her, and lo! the beauty of her features, and the grace of her form were such as he had never yet seen; and when she raised her lovely eyes the Emperor felt as though rays of light were shining on him.

The Emperor rejoiced exceedingly, because although beautiful girls were brought to him from all the four quarters of heaven, yet not one of them approached Pao-sze.

Without informing the Empress of the new acquisition, (1) Yu-wang kept Pao-sze there and gave her a special pavilion. At the same time he issued an edict releasing Pao-hsiang from prison, and reinstating him in his previous office.

From thenceforth Yu-wang and Pao-sze were inseparable; they sat side by side and stood up shoulder to shoulder; when they drank they exchanged glasses; when they ate they did so from the same dish and plate. For ten days in succession the Emperor held no audience, the officials who had crowded round the door of the hall of audience did not get a sight of the face of the Emperor, and went sighing back to their homes.

This occurred in the fourth year (778 B. C.) of the Emperor Yu. Referring to this a certain poem says:—

"He plucked a beautiful flower called 'wonderful fragrance'; (2) hempen cloth and thorns have suddenly become the bedfellows of the Emperor. (3) It occurs every day that the Emperor is sensual. But alas! ruin lurks under the dragon's saliva."

In a word Yu-wang did not separate himself for a moment from Pao-sze. He was constantly with her in the "Jewelled Chamber." (4) Three months passed by in this manner, and during the whole time he did not once enter the Chamber of the Empress Shên H'ou.

At last Shên H'ou heard the whole story. Beside herself with rage, she forced her way one day with several court ladies without any ceremony into the "Jewelled Chamber" and found the Emperor with Pao-sze sitting in his lap. As the Empress entered, Pao-sze did not rise for an instant to approach and greet her. Shên H'ou could not stand this, and broke out: "What is this, what common slave has forced her way in here to pollute the palace?" Yu-wang fearing that the Empress might commit some act of violence, stood before Pao-sze to protect her, and replied for her "This is a girl who has lately come for the Seraglio; her rank has not yet been fixed, and therefore I have not presented her to you. You need not be angry." Shên H'ou gave vent to her feelings once more in reproaches, and went away in a rage.

Pao-sze said "Who was that, then?" The Emperor said:—"That was the Empress. You can pay her a visit to-morrow."

Pao-sze fell into thought, and was silent. On the following day however she did not go to the Empress.

The Empress Shên sat deeply troubled in her chamber. The Crown Prince Ichu knelt down before her, and said:

"My mother, you are the mistress of the seraglios; how then can you still have trouble in such an exalted position?"

The Empress replied:

"Your father has given all his love and favour to Pao-sze, and forgets the difference between a lawful wife and a concubine. If this woman's power be not destroyed, you and I will soon be forced out of the palace."

She then told the Crown Prince how Pao-sze had not yet paid her a visit, nor had she stood up in her presence; and while she related this, tears unconsciously fell from her eyes.

The Crown Prince said: "I will soon correct this. To-morrow is the first day of the new month and my Imperial father must hold an audience. You can then send a crowd of servants to the Jewelled Chamber, to tear the flowers which are there, and to allure the worthless slave from the Pavilion. I will then chastise her before your eyes to appease your anger. If my father becomes angry about it, every thing will fall on me, and you will be blameless."

The Empress said: "Do not be too hasty, my son! We must have patience and think once more of the matter."

The Crown Prince left the palace in great anger, and another night passed away.

(1) That the Emperor should take a new concubine is according to Chinese ideas, quite regular, and the Empress can do nothing against it for herself. It was however a violation of etiquette to take Pao-sze into the seraglio without having first mentioned it to the Empress; for as we have already seen in the first chapter, the Empress was head of the six seraglios.

(2) Literally: "Fragrance distributed over the whole land."

(3) "Hempen cloth and thorns" an abbreviation for "wearing an underdress of hempen cloth, and a thorn for a hair pin" that is, a girl of the lower classes.

(4) The name of the pavilion mentioned above.

Next morning Yu-wang betook himself to the hall of audience, and all the officials made their appearance to congratulate him on the first of a new month.

The Crown Prince then sent a number of the servants of the palace to the Jewelled Chamber who according to his orders began to pluck the flowers in the garden beneath and to put it in disorder. Another crowd of servants hastened in from the other side and said to them; "These flowers were planted by the Emperor specially for the Empress Pao; he looks at them frequently himself, and if you put them in disorder you will be committing no small offence."

The other servants answered:

"We have received distinct orders from the Eastern Palace (1) to do this, and to pluck flowers for the lawful Empress in the Chief Palace. Who dare prevent us then?"

Both parties came to hot words, and Pao-fe (2) hearing the noise came out to see what it was. The anger which she felt, was about to break out, when the Crown Prince came up unexpectedly. Pao-fe was quite unprepared for it. The Crown Prince stood like a deadly enemy before her, and looking at her angrily, took a step closer, and seizing her hair cried out:

"Who are you then, woman without name or rank, that you venture to take the title of 'Empress,' and to look down on other people. I will shew you to-day who I am."

With these words he closed his fist and struck her. He had hardly struck her twice, when the servants of the palace, who feared that the Emperor would be enraged because of this affair, all knelt down, and with their heads on the ground cried out.

"O Imperial Prince! Show mercy! Think of the Emperor!"

The Crown Prince who was afraid that he would finally cause Pao-fe's death stopped his blows. Pao-fe full of shame and oppressed with pain, returned to her chamber. She understood perfectly that the Crown Prince wished to revenge his mother, and tears flowed from her eyes. The servants consoled her, and said:

"Grieve not, lady, the Emperor will soon take care of the rest."

The sound of these words had not yet died away when Yu-wang, the audience being finished, entered the chamber: and when he saw Pao-fe with disordered hair and in tears he enquired why she was not yet combed and dressed. Pao-fe caught the sleeve of his mantle and weepingly said:—

"The Crown Prince came this morning to my Pavilion with a crowd of servants and plucked the flowers. As soon as he saw me, who have never yet done him any injury, he commenced to upbraid and beat me. If the court ladies had not begged him to desist, he might have taken my life. I implore your Majesty to assist me!"

When she had said this, she sobbed and wept bitterly without ceasing. Yu-wang understood the whole affair immediately, and said:—

"All this has occurred because you did not visit his mother. This did not originate with the Crown Prince, he was incited to it by the Empress. You would be wrong to feel angry with him."

"The Crown Prince" replied Pao-fe "hates me because of his mother. He endeavours to take away my life. If I, a single female, should die, it would not be of much consequence. But since I have received your Majesty's love I have for two months carried its fruit in my bosom; my life is that of two; I beg to be allowed to leave the palace, so that the lives of mother and child may no longer be exposed to danger."

Yu-wang entreated her to set her mind at rest, as he had power to punish.

The same day an Imperial edict to the following effect appeared:

"The Crown Prince Ichu is insolent, unprincipled and disobedient: he is therefore banished to the land of Shen to enjoy there the instruction of the Count of Shen. The Prince's tutors have not shown themselves fit for the

(1) The Crown Prince lived in the Eastern palace, and was therefore called by this name. In a similar manner the lawful Empress was called "The Chief Palace" after her residence.

(2) Fe is the title of concubines of the higher rank in the Imperial seraglio.

task committed to them, and therefore at the same time deposed from their offices."

The Crown Prince desired to go at once to the Emperor, and justify himself, but the latter had already given orders to the guards at the gate not to admit him; there was therefore nothing for him to do but to seat himself in the carriage and go to the land of Shen.

As the Crown Prince did not come to tell his mother, she ordered her servants to inquire about him, and then learned for the first time that he had gone into exile to the land of Shen. One cannot clap without two hands; (1) and she could do nothing but day after day murmur against her spouse and think on her son; so her days were spent in weeping.

Meantime Pao-fé, after the child had been in her bosom for ten months, (2) bore a son which Yuwang loved as a jewel. He gave the child the name of Po-fu, and frequently thought of declaring him heir to the throne in place of Ichin. But as he had no plausible ground for doing so, he was in despair as how he could bring it about. Ko-shih-fu guessed correctly what was in the Emperor's mind, and consulted with Yinch'iu. Both men soon placed themselves in communication with Pao-sze, and said to her.

"As the Crown Prince is exiled it is evident that Po-fu must become heir to the throne. If you, exalted lady, entreat your husband in the intimate hours of love, while we both use our best endeavours in the Council, it would be folly to have a doubt of the successful issue of our efforts."

Pao-sze rejoiced and said.

"I leave myself entirely to you two worthy men! If Po-fu ascends the throne he will divide the rule of the world with you both."

Henceforth Pao-sze secretly commissioned her trusty servants, to lurk day and night about the Empress Shen-H'ou, and see whether they could not catch her doing something wrong; both inside and outside the apartments of the Empress Sze placed ears and eyes, so that she knew of every breath of wind, and of the movement of every blade of grass.

Meantime the Empress sat alone in her chamber and wept the whole day. An old female servant of the palace however, who understood the grief of the Empress, knelt down and said.

"Exalted lady! You constantly cherish a longing for the Prince, and therefore you should write a letter, and send it secretly to the land of Shen you should request the Prince in it to implore the forgiveness of the Emperor. Perhaps the latter will be appeased, and recall the Prince. The long separation between mother and son will then be put to an end."

"What you say" replied Shen-H'ou "is very pleasant; but how am I to send the letter."

The servant replied:

"My mother, the old Wen, is skilled in the cure of diseases. You can be ill, and putting yourself into her hands under this pretence, give her the letter, which my elder brother can convey to its destination. It must succeed in this way."

Hereupon Shen-H'ou went in and wrote a letter, in which she said something to this effect:

"The son of Heaven is unprincipled, he prefers an ill-looking slave, and has separated mother and son. This ill-looking slave has now borne a son, and the Emperor has in consequence increased his favour towards her. Let you, my son, sue for pardon to the Emperor, acknowledge your guilt, and feign sorrow; if Heaven so order it that you return to Court, when we are face to face we can think of further steps."

After the letter was written she gave out that she was ill, took to her bed, and called the old Wen.

Pao-fe received information of this immediately. "Aha!" said she "she has some object, a letter or something of that sort. As the old Wen is leaving the palace, she must be searched, and then it will soon be shewn what is the matter."

Meantime old Wen came to the Chief Palace. The old

(1) Literally: "It is difficult to clap with one hand," a Chinese proverb meaning that one can commence nothing when they stand completely alone.

(2) The Chinese count ten months as the period of pregnancy.

servant, her daughter, had previously instructed her. Shen-H'ou placing herself as if she wished her pulse felt, brought the letter from under the pillow, and impressed on the old woman that it must be carried day and night without delay to the land of Shen. At the same time she presented the woman with two pieces of the finest silk. Wen put the letter in her bosom and went out of the palace very well satisfied with herself and holding the silk open in her hand. She was stopped by the Eunuchs who held watch there, and asked where she got the silk. The old woman replied: "I have examined the illness of the Empress, and have received this in return." The Eunuchs said "Have you nothing else with you;" she replied no, and the others were about to let her pass, when one of the servants said, "would it not be better to examine her closely?" She was immediately led back in a high state of disquietude and confusion, which caused the Eunuchs to suspect something and to insist on an examination. The whole crowd of servants came around, and examined and tore her clothes, so that very soon the corner of a letter appeared. They took possession of the letter of the Empress Shen-H'ou, and brought the woman together with the letter without delay to the Jewelled Chamber of Pao-fe. Pao-fe opened and read the letter: she was very angry, and ordered them to put old Wen in a solitary chamber, and to permit no one under any circumstances to have any communication with her. She then took the two pieces of silk which old Wen carried, and cut and tore them into a thousand pieces. When, soon after, Yu-wang entered the Pavillion and saw the torn silk, he asked what it all meant. Pao-fe replied with tears in her eyes.

"I have entered the palace and received your favour only for my own misfortune; for the jealousy of the Empress has already excited the Chief Seraglio. Again it is only to my own misfortune that I have given birth to a son, who has only increased her jealousy. See, the Empress has written a letter to the Crown Prince, at the end of which she speaks of further plans! I am sure she is aiming at my life and at that of my son. I implore you to assist me!"

With these words she handed the letter to the Emperor. Yu-wang recognized the handwriting of Shen-H'ou and asked who the bearer of the letter was. "The old Wen;" said Pao-fe "she is here in custody."

Yu-wang ordered the old woman to be dragged before him, drew his sword, and before she could utter a word cut her in two pieces. The "old man with the Beard" has a poem on this occurrence:—

"Before the letter was sent, you stained your shining sword with innocent blood. If people enquire how the Crown Prince subsequently came to his right, the highest service must be attributed to the old Wen."

The following night Pao-fe overwhelmed the Emperor Yu with caresses, and said:

"My life and that of my son lie in the hands of the Crown Prince." "But I am here still" said Yu-wang, "why need you trouble yourself about the Crown Prince?"

Pao-sze said:

"After the thousand autumns and ten thousand years, my (1) Imperial husband, it cannot be otherwise than that the Crown Prince ascends the throne. The Empress now sits day and night murmuring and calling down maledictions on us. If the power one day should come into her hands, and those of her son, Po-fu and I would not find a few feet of earth for a grave after our deaths."

Saying this, she commenced again to sob and weep bitterly.

Yu-wang said:

"I should be glad to degrade the Empress and the crown Prince from their ranks, and to make you lawful Empress and Po-fu Crown Prince; but I fear that the Ministers and officers would put themselves against it. What can I do then?"

"It is the rule" said Pao-fe "that the Ministers obey the Prince. It is folly for the Prince to obey his Ministers. My husband should impress this on the Ministers and then hear what they have to reply to it."

Yu-wang replied that she was certainly right; and the same night Pao-fe sent a trusty messenger to Ko-shih-fu and Yin-ch'iu instructing them what they should say at the audience the following morning.

(1) i.e. "After your death."

The following day at the early audience, the Emperor at the conclusion of the formalities called the Ministers to him and said "when the Empress is jealous, has rage at her heart, and utters imprecations, so that she can no longer be recognized as the mother of the world, would it be politic under such circumstances to arrest and make her answer judiciously for it?"

Ko-shih-fu replied:

"The Empress is mistress of the six seraglios. If she be guilty of an offence, it is not permissible to seize and make her answer for it. But if indeed her virtue remains behind her high position, she must be deposed from the rank of Empress by an edict, and another virtuous lady chosen to fulfil faithfully the duties of mother to the world. In this way the happiness of the Empire would be assured for ten thousand generations."

Upon this Yin-ch'in said:

"I have heard that the Princess of Pao is adorned with every womanly virtue, and is worthy of ruling in the central seraglio."

Yu-wang again spoke:—

"The Crown Prince is in Shen. If we degrade the Empress Shen-H'ou, what shall we do with the Crown Prince?"

Ko-shih-fu replied:

"I have heard it said the son and the mother and the mother and the son are the dearest to each other. As the Crown Prince is now in exile in Shen he cannot fulfil his duties as a child; and as the mother is to be degraded, we cannot use him any more. We all wish that Po-fu would be named Crown Prince. By this means alone can the land be blessed."

Yu-wang rejoiced exceedingly, and issued an Edict confining Shen-H'ou in the "Cold Chamber" (a solitary cell), and declaring that Ichu had forfeited the throne and nobility; on the other hand the Princess of Pao was proclaimed Empress, and Po-fu Crown Prince. The edict went on to say that whoever spoke against any of the arrangements thus made, would be regarded as an accomplice of Ichu, and would be severely punished.

This occurred in the ninth year of the reign of Yu (B. C. 773).—When the officials over the whole country heard of it, they felt angry at heart, but as they knew that the Emperor's resolve was immovable, and that if they made any representations to him on the subject they would bring death on themselves, they sealed their mouths (1) and held their peace. But the Imperial Astrologer Poyang-fu sighed and said: "The three Kangs (2) are cut in pieces, and one might await standing the fall of the house of Chou. (3) And immediately making the feebleness of old age a pretext, he sent in his resignation of his office. A great number of other officials did the same and retired to their lands in the country. In the court, about the Emperor, there remained only Ko-shifu, Yinch'in, Chai-Kung-i and other bad men. Yu-wang however passed his days in pleasure in the Seraglio with Pao-fe.

Although Pao-fe had now by craft reached the rank of lawful Empress, and she alone shared Yuwang's couch, her face was constantly overcast and no smile showed itself on her lips. Yu-wang would have been glad to cheer her up, and for this purpose ordered music to be played—bells sounded, drums were beaten, flutes blown and stringed-instruments were played, while the cup went round with merry songs; but Pao-fe's face was still overcast. Yu-wang therefore asked what she would like, as she found no pleasure in the music.

Pao-fe replied:

"I find pleasure in nothing in particular. But now I remember that as I tore the silk lately with my own hands, the sound of the tearing pleased my ear."

Yu-wang said: "If you desired to hear the sound of silk being torn, why did you not tell me so long ago?"

(1) Sic, literally, in the Chinese.

(2) Kang is the chief cord in a fishing net, by means of which the net is spread out and drawn in again. For officials the sovereign, for the son the father, for the wife the husband, have the same relation, which the cord has to the net—namely to regulate it. Hence these relationships are called the three Kangs or "net cords." Yu-wang broke the three because he caused dissatisfaction amongst the officials, exiled his son, and cast off his lawful wife.

(3) i.e. The house of Chou will fall before a person who is standing will grow tired and feel the want of a seat.

He immediately ordered the overseers of his storehouses to issue a hundred pieces of silk; and the strongest of the court ladies had to tear them up in order to cheer Pao-fe.

But, remarkable to relate! Although she was glad to hear the sound, a smile came on the cheeks just as little as before.

Yu-wang inquired again why she did not laugh, and was answered that it was not in her nature to do so. Yu-wang replied "I am determined that you shall laugh once at least." He therefore issued an edict to the following effect:

"He who causes the Empress Pao to laugh once shall have a present of 1,000 Taels, whoever he may be,—whether he belong to the Court or not."

Ko-shih-fu came before the Emperor, and said:

"In earlier times your Majesty's ancestors, in order to be always on their guard against sudden raids of the Western Barbarians, (1) erected more than twenty-five obelisks at the foot of Mount Li, on which from thirty to forty large drums were placed. When the barbarians fell on the land, the guards caused wolf's smoke (2) to ascend. As soon as the smoke was seen ascending to Heaven, all the vassals settled in the neighbourhood came to resist the attack: and when the drums began to sound, they hastened still more. Latterly profound peace has reigned under Heaven, and the signal fires are extinguished. If my lord and Emperor desires the Empress to laugh, Your Majesty must betake yourself with the Empress to mount Li and cause the smoke to ascend in the night. The feudal princes will certainly come with their auxiliary forces, and when they do so, and find no enemy, Her Majesty will certainly laugh."

Yu-wang replied that this was an excellent idea.

The Emperor then entered his carriage with Pao-H'ou and drove to mount Li. In the evening he prepared a banquet in the palace on Li, and gave the order to have the signal fires lighted. It occurred, however, that the Viscount Yô of Cheng who, as master of the ceremonies had to make all the necessary preparations, was in the palace when the Emperor set out on his journey. When he received the Emperor's order, he was filled with fear, and hastening to the palace said:

"Your Majesty's exalted ancestors have erected the fire obelisks in order to give the feudal princes information of danger which cannot be mistaken. If we now make the signal for no reason, it will be said that we have made fools of them. Then if afterwards something unexpected should occur, how shall the soldiers come to help us in our need?"

Yu-wang grew angry and said:

"Profound peace reigns under Heaven to-day, why should we want soldiers? The Empress and myself have come to the Li Palace and we have no amusement. I will therefore have a little joke with the feudal princes. I think that what may occur subsequently should be all the same to you!"

The advice of the Viscount of Cheng was therefore disregarded, large signal fires were lighted and the great drums were sounded. They resounded with a noise like thunder; and the fires flared up to Heaven.

The feudal princes in the neighbourhood believing that the capital was in danger, armed all their warriors, appointed commanders and made forced marches to Mount Li. Arriving there they were met by the sounds of joyful music from within. Yu-wang who had enjoyed himself at the banquet with Pao-fe, immediately sent a messenger to them to say:—"Fortunately there is no enemy in the land. You might have spared yourselves the trouble of clambering over mountains and wading through rivers."

The princes looked at each other in wonder, rolled up their banners and departed thence. While this was going on the Princess of Pao stood on the balcony of the palace, and when she looked down and saw how the feudal princes and their forces hasten up, and hasten back again, without anything happening, by an involuntary movement she struck her head with her open hand, and laughed loudly three times. But Yu-wang said that when she laughed a hundred pieces passed over her countenance.

(1) i.e. the Jung, mentioned in the first chapter.

(2) i.e. in the fire obelisks conveyed by a wolf's howl. Wolves' howls are the "three Kangs," give a strong and thicker smoke than any other bones.

"This," said he, "is K-shih-fu's reward" handing him a thousand taels. Up to the present day there is a proverb in every mouth:—"To buy a smile for a thousand taels." This saying originated from the above occurrence. The "Old man with the Beard" has written a special poem on this jest with the wolf's smoke in which he says:

"At night the sound of flute and song resounded in Li-kung, while without any occasion, the signal fires ascended to Heaven. The princes hastened up to help; but lo! it all occurred merely to get the Princess of Pao to laugh."

When the Count of Shen heard that Yu-wang had made the princess of Pao lawful Empress, he presented a memorial to the Emperor in which he said:

"When in ancient times Chieh (1) preferred Mehsi, (2) the house of Hsia was ruined; when Ch'ou (3) preferred Taohi, (4) the house of Shang was ruined. Your Majesty now prefers the Princess of Pao, the son of the lawful Empress is disinherited, and the son of a concubine is made Crown Prince. The marriage relations are destroyed, and the love between father and son is disregarded. The history of Chieh and Ch'ou repeats itself before our eyes; the misfortunes of the houses of Hsia and Shang will not tarry much longer. I hope that my lord and Emperor will recall this senseless edict, and then the evil which threatens the land may perhaps be averted."

When Yu-wang read this memorial, he struck the table with his hand, and cried angrily:

"Ha! the wretch dares to write such nonsense to me!"

Ko-shih-fu said:

"The Count of Shen has been dissatisfied at heart for a long time. Now that he hears that the Empress and the Crown Prince have been degraded, he meditates rebellion in his heart, and dares to reproach my Emperor thus publicly."

Yu-wang asked in what way he could best be punished.

Koshihfu replied:

"The Count of Shen has distinguished himself in nothing; his rank was increased only on account of his daughter the Empress. As both the Emperor and the Crown Prince have been degraded, the rank of the Count of Shen should also be taken away, and he should be reduced to the previous rank of Viscount. Soldiers should be sent at the same time to chastise him. In this manner further mischief will be prevented."

Yu-wang agreed with Ko-shih-fu and issued an order altering the title of the count of Shen to Viscount, and naming Ko-shih-fu as general with orders to prepare for a campaign against Shen. Who finally carried off the victory, and who was defeated, will be related in our next chapter.

THE JAPANESE PRESS.

THE NEW CURRENCY.

(From the 'Hochi Shimbun'.)

AS WE think that we have already completed, in our previous numbers, our arguments on the wording of the Notification of the 27th of last month, we now proceed to consider the Silver Trade Dollar itself, and will show what advantages may be expected from the coin when the design of establishing it shall have fully succeeded. If it should really succeed in establishing itself, as the Government estimates it will, and shall acquire power in Oriental markets, then these advantages will be three:—1st the loss which arises from the excessive fluctuation of the Mexican Dollar (as we have briefly shown before) will be avoided; 2ndly, the current coin of the Japanese Empire will gain the renown of usurping power over the mercantile world of the East; and 3rdly, more or less profit will be gained from the charges for coining the immense quantities of silver coin which are required for circulation therein. If, indeed the Government have in view the idea of making profit—then we apparently know the principal aims of the Government to be no other than the three enumerated.

Since the Mexican Dollar has been supreme in the markets at our open ports, both home and foreign traders have fre-

quently and unwittingly sustained no little loss in transactions in goods and coin, in consequence of its fluctuations; and these fluctuations appear to have been principally caused from the Mexican Dollar being in excess, or in deficiency, and that this irregularity of supply should so often occur, seems to have been principally owing to the limited area of our markets (and consequent limited area of its circulation). For instance, take the state of the Yokohama market six or seven years ago. Was it not such that one could fairly correctly fix the season of the year when the Mexican Dollar would fall in value? That season was only when the sale was going on of Tea, Raw Silk, Silk-egg cards, &c., i.e. when foreign merchants were freely parting with Mexican dollars for the purchase of our produce; and so large a quantity of the coin being thrown at once upon our markets, it fell in value. This is an actual, practical, example of the excess or deficiency of the Mexican Dollar, so easily causing fluctuation in its price; and whenever this fluctuation occurs, the merchant from the interior has to suffer the loss and inconvenience of the Mexicans which he may be holding suddenly becoming different in value.

Now if we investigate the cause of this fluctuation itself we find it arises from the fact that the area of circulation of the Mexican Dollar is so limited.

If the area of circulation be limited, the total amount of coin in circulation must be small, and if the total amount be small, sudden fluctuation in value must necessarily ensue whenever there is a slight excess or deficiency in amount. This is how the Mexican Dollar occasionally inflicts loss upon our merchants from the interior. As however, the Mexican cannot be allowed to circulate generally throughout the country, the only remedy is to give to our own coin the same power in the markets. But even though the coin be our own, if its circulation be as limited as that of the Mexican Dollar, no complete success can be expected. But if a coin which is in general circulation in the interior be put into competition with the Mexican Dollars in the markets at the open ports; then, in consequence of its extensive and general circulation, the danger would be avoided of fluctuations arising from slight excess or deficiency, and merchants from the interior would not be exposed to sudden and unlooked-for loss by a fall in the exchange. At this we should extremely rejoice.

Although the Mexican Dollar has been for a long time in circulation in Oriental Markets,—on account of its bearing no reliable certificate of any of the Governments of the East,—its having been sometimes carelessly coined,—there being not a little counterfeit coin in circulation lately, and its having been disfigured by private stamps having been impressed upon it;—for these reasons, many people in Oriental markets are wishful to have a reliable coin to replace it. But the Chinese Government has not yet commenced to make new coin convenient for the purpose, nor has the British Government any intention to establish a new Mint especially for its territories in the East or for countries adjacent to them on the continent of Asia. If therefore, seizing the present good opportunity, a reliable character were given to our coin, so that it might acquire supreme power in Oriental markets, this indeed would redound greatly to the credit of the Japanese Empire. And further, should this scheme of replacing the coin really succeed; the 3rd advantage, i.e. the income from the charges for coinage would be great. We, however, know that the objects of our authorities in making this change in the currency are chiefly the 1st and 2nd we have named, and not for the 3rd. Should the great loss and injury to trade which arises from the fluctuations of the Mexican Dollar be put a stop to, and the coin of the Japanese Empire made to circulate in Oriental markets, our Mint authorities would be satisfied if the income paid for the labour, and would not look for profit.

What we have said above is a statement of the advantages derivable from what we presume to be the objects of our Government in changing the current coin at the open ports. That we all wish to see these three advantages gained, we have already briefly stated, but if we consider the means by which this scheme is to be carried out, then we come to the question:—Where is the supply of bullion for coining the Silver Trade Dollar to come from? As the markets in the East are extensive, the quantity of the Mexican Dollars circulating therein are also great. Therefore, in order to push it out of circulation, the amount of our own coin provided must be equally large; but,—from the actual state of things in the country,—we know that the supply from the

- (1) The last Emperor of the Hsia dynasty.
- (2) The notorious concubine of Chieh.
- (3) The last Emperor of the Hsia dynasty.
- (4) The notorious Concubine of Ch'ou.

silver mines is very limited, and evidently insufficient for the requirements it would have to meet.

The only means to get a sufficient supply for Oriental markets, will be to let foreign merchants bring the Mexican Dollar to the Mint for re-coining, and to let the people in the interior bring the old silver coins which they have been accumulating, or silver plate, ornaments, &c. But unless the coin of our country is really relied on, it will be difficult to get hold thus of the Mexican Dollar now actually in circulation, to use as bullion for our new coin and unless the silver stored by the people in the interior continues to come in regularly into the Mint, this source of supply also cannot be guaranteed against becoming deficient. As we cannot at the present moment foresee that these two things will be, we cannot be sure whether or not this scheme will bring forth a favourable result in the end. We shall therefore defer final decision on the success or failure of this scheme of the Government until we shall have seen a precise account of how these two things are going on. But as regards the scheme being a praiseworthy one,—on this head, we have nothing more to say.

(From the 'Nichi Nichi Shimbun'.)

WE have, in successive issues of our journal, argued that, although, by the laws of our country, Gold is the standard coin,—yet, in reality, gold and silver coins both occupy the position of standards; and we have also explained the changes which, in course of time, the standard has undergone. And we were about to proceed to argue on the advantages and disadvantages of double and single standards for coins, and also as to which of these had better be adopted in the existing state of the country. But the *Hochi Shimbun*, in the editorial columns of that paper of the 8th inst., having argued that, as the Silver Trade Dollar has no fixed name or rank, the Notification of the 27th ulto., alone, is not sufficient to prove that silver coin is made standard,—and attacked our arguments in favour of the theory—we, too, must defer proceeding with the expression of our views, and must for the sake of the *Hochi Shimbun* clear up his doubts.

The *Hochi Shimbun* says:—

"The Silver Trade Dollar is only a piece of silver, with the simple certificate that it has been coined by the Mint of the Japanese Government, and it has indeed the character of a 'Trade Dollar,'—inasmuch as the Government has not fixed it as exchangeable with the one *yen* gold coin, or any fixed amount of *sen*, but allows it to fluctuate freely from time to time."

He goes on to say that:—

"So long as the Government has not given this piece of silver a fixed name or rank, it is evident that the Silver Trade Dollar can, in accordance with its character as bullion, fluctuate freely in value from time to time, and that business may be transacted in it, according to the current price of the day."

And again:—

"As the current value at which it arrives in its fluctuations is calculated according to that of standard gold coin, and as gold coin remains unchangeable, this silver piece cannot be a standard coin, but must always depend on the value of Gold coin" and—"the Notification of the 27th ulto. simply shows that the current price of the Trade Dollar will differ from time to time according to the state of demand and supply: and if the people pay to the Government one Silver Trade Dollar at the current value of less than one *yen*, by what law has the Government the right to stop the people from doing so? On the other hand,—should the Government pay it out to the people at the rate of one Trade Dollar for one *yen*,—if the people refuse to receive it, except at the current price of the day when it may be of less value than a *yen*,—by virtue of what Notification can the Government force the people to accept it as one *yen*? According to the Notification of the 27th ulto. the people have the right to take from the Government the Silver Trade Dollar as one *yen*, or less, according to the current rate of the day. This, because the coin has no fixed name or rank, and still retains the character of a piece of bullion only."

The above quotations sufficiently display the arguments of the *Hochi Shimbun*.

In dealing with arguments like these, we must first recall to the memory of the Editor of the *Hochi Shimbun* the Laws of the Japanese Empire. We will give an extract from the

Law relating to the Silver Trade Dollar for his information:—

The 6th clause, on the Limit of Circulation of Coins, in the Regulations relating to the New Coinage, issued in the 5th month of the 4th year of Meiji (1871) says that:—

"The relative value of the silver *yen* and the standard gold coin, in payment of duties and taxes at the open ports, will be for the present at the rate of 100 *yen* of the Silver coin to 101 *yen* of the standard gold coin" (i. e. at the rate of 23.38 grains of gold to 37.44 grains of silver).

The Notification No. 35 of the 28th day of the 2nd month of the 8th year of Meiji (1875) says:—

"It is hereby notified that the Silver one *yen* which has hitherto been coined in the Mint at Osaka shall hereafter be increased in weight and named 'Silver Trade Dollar,' in consequence of which, the device on its face and reverse, its weight and the amount of charge for coining &c. shall be revised as mentioned in the accompanying note" (i. e. at the rate of 23.38 grains of gold to 388 grains of silver). The 6th clause, on the Limit of circulation of coins in the Coinage Regulations of 1871 (quoted above) revised by the Notification No. 27 of the 4th of the 3rd month of 8th year of Meiji (1876) says:—

"The relative value of the Silver Trade Dollar—old and new—and the Standard gold coin, at which rate, duties and taxes may be paid at the open ports by foreigners, will be at the rate of 100 of the silver coins to 100 *yen* of the standard gold coins," (i. e. at the rate of 23.15 grains of gold to 388 grains of silver). And Notification No. 56 of the Tōkiō fu on the 23rd day of the 3rd month of the same year says:—

"It is hereby notified, in accordance with orders from the Okurashō (Finance Department) and for the information of the public, that the revision of the relative value of Silver Trade Dollars and the standard gold coin having been recently notified by Notification No. 27 of the Daijō Kuwan (Council of State) Mexican dollars shall also be calculated at the rate of 100 Mexican Dollars to 100 *yen* of the gold coin."

Thus, by the laws now in existence, one Silver Trade Dollar is made to circulate at the same value as one Gold coin and this will be sufficient to prove that it is not—as the *Hochi Shimbun* says—allowed to fluctuate freely in value. So that, in transactions between the Government and the people, the latter have no right to take the Silver Trade Dollar as one *yen* or under according to the current rate of the day.

Further, the 5th clause on the Limit of Circulation in the Coinage Regulations, which was revised in the 6th month of the 8th year of Meiji runs thus:—

"The Silver Trade Dollars may only be used for paying duties on exports and imports, and other taxes paid by foreigners, and also in business transactions between Japanese and foreigners; it cannot be used in payment of taxes in the interior, nor in general business;" and has now been revised by the Notification of the 27th ulto. to this:—

"These Silver Trade Dollars may be used in paying the Custom's duties and all other taxes paid by foreigners, and in all business transactions between Japanese and foreigners, and also in payment of all taxes in the interior, and in all other payments, public or private, the same shall be legal tender to any amount." And so the Silver Trade Dollar has to perform the duty of a standard coin and may be calculated to any amount, and it is not necessary to put any limits on it.

Such being the law, both Government and people, since the 27th of last month, may make payments in public or private, with the Silver Trade Dollar, and the receiver has no reason to refuse to accept it. And further, as it cannot be looked on as equally limited with the subsidiary coin of a fixed rank (not the 'fixed rank' of the *Hochi Shimbun*, but that of the Coinage Regulations) it may be paid out to the extent of mill ones of *yen*. And, as regards its value, the law being, as plainly shown above, that one gold *yen* is to be of the same value as one Silver Trade Dollar,—so long as the law of Japan will not allow standard coin to be sold publicly at the current price of coins of the day (though in the market the difference between gold coin and the Silver Trade Dollar may be more than five per cent, the people must pay both coins to Government as of equal value, and Government, too, must accept them in the same way. This is clear, too, from the fact that, though gold coin is about 10 per cent

higher than paper money in the market at present, yet in public transactions they are treated as of the same value.

We believe that the above explanation will be sufficient to make clear the doubts of the *Hochi Shimbun*, and that the Editor will come to a thorough understanding on the subject. Should there, however, be any point which is not so understood, we shall not decline again to explain it.

EXTRACT.

THE DISASTER TO THE "CHINA."

(From the *Bombay Gazette*.)

THOSE passengers who left Bombay harbour on Monday evening (May 13) in the *Kashgar*, and who were to have sailed in the *China*, have reason to congratulate themselves that the fire which has nearly destroyed the latter steamer did not break out at sea, for if it had, there would have been a terrible disaster. If the fire could not be mastered in the harbour, where every appliance for extinction was at hand, much less could it have been subdued in the open sea. It may be thought that it would have been impossible for the fire to have taken place outside of the harbour, but this is a mistake. No one is able to say definitely how the fire occurred, but as it was discovered in the fore-hatch, where cotton was stowed, there is every reason to suspect that the catastrophe was caused by some bale that had caught fire before it was placed on board the ship—probably in a native cargo boat, in which the crews are addicted to smoking native cigarettes and throwing them about anywhere when done with them. Now, it is astonishing how long a close-pressed bale will smoulder when once it has caught fire. It will smoulder away slowly and almost imperceptibly for days, and it is only accidents that will determine when it shall burst into flames. The *China* was to have left for Suez on Monday, and it was extremely fortunate that the smouldering bale burst into active flame when it did, for had it smouldered for but a few days more the steamer would have been at sea; and we have seen that when the fire did break out, it was found impossible to subdue it without sinking the ship. Looking at the danger which has been run, would it not be well henceforth for rigorous measures to be taken to prevent native boatmen from smoking in the vicinity of inflammable cargoes they may be taking off to steamers? We think the matter is worth the serious consideration of every person concerned.

The *China*, formerly a fine frigate-looking steamer, now presents a singular appearance, and it is strange that so few of the public have gone off to see the unusual spectacle that, comparatively speaking, is now lying at their very doors. The sight of a fine steamer lying at one time up to her rails in water and at another all but hidden beneath the waves, nothing of her being visible but two masts, the upper part of a black funnel, the bridge, and the roof of the captain's cabin, is not one to be seen every day. On Monday we visited the steamer, and had an opportunity of realising the extent of the disaster which has occurred to her. The scene is the beautiful one that all who have looked across the harbour from Mazagon Bunder are acquainted with;—in front the group of P. and O. steamers, and in the background the verdant isles of Salsette, Elephanta, and Butcher's Island, with many a white sail flitting between them over the dark blue water. The *China* lies nearly a mile off the Bunder, on what is called the Mazagon mud-bank. She is surrounded by boats, which, coupled with her position, makes her almost invisible until the visitor is close upon her. Then, if the tide happens to be low, he can see a long strip of black surmounted with white railings, and this is the principal part of the *China* visible. The figurehead is a Mandarin with a long pigtail, and his toes are in the water; at high tides he and his pigtail disappear altogether. The boats and barges near the steamer are filled with pumping apparatus and shrieking natives. Here on one barge are two of the Municipality fire engines, under the charge of Mr. Whittaker; on another, there is the Port Trust fire engine; and a little further on, there are the Government water boat, two P. and O. water boats, and one anchor hoy, all provided with suction pipes. The engines and the suction apparatus are all hard at work, making a hissing, deafening clamour. On board the *China*, we see what all this energy is being directed against. Half a dozen hose pipes are down in the ship's hold, but although they are continually swollen with water, and look like bloated balloons, somehow the great black ditch in the inside of the steamer never seems to get any nearer the fever. One is reminded by their efforts of Mrs. Partington's mode of extermination to sweep back the Atlantic from her door with a mop. Nevertheless, everybody who can possibly get an excuse for touching a hose or

touching a fire engine, or a suction pipe seems to think he is doing excellent service. No doubt plenty of hard work is being done, and has been done during the last four days; but, *cui bono*? Look at the water in the inside of the steamer, and there find the answer. The water is just on a level with the tide outside. Perhaps the 150 odd men who are struggling about night and day with the hose-pipes might succeed in emptying the steamer, but alas! they cannot make the necessary arrangements with the tides. These flow twice a day, leaving the workers only about six hours to work; and as sure as they come they fill the ship again and leave her just as bad as she was before—that is, hopelessly under water. On Monday, great hopes were entertained that the tides would be outwitted. A large Port Trust centrifugal pump, capable of throwing out water at the rate of 130 tons an hour, was fixed on planks above the main hatch. Steam was got up; but unfortunately the pump would not work. Nobody seemed to understand it; there was a valve shut up, or something of that kind; and at last, when the shades of eve were falling, and the steamer was fast getting into her totally submerged condition, it was acknowledged that the working of the great pump must be abandoned for a day and that meantime its doctor must be called in. But there are some who shake their heads at the big pump, and say that it will never do; and they argue thus. There are only three hours for work before one tide comes and sweeps right over the vessel; therefore, the steamer must have as much water taken out of her in that time as will float her—say, at least 1,500 tons. The centrifugal pump can only throw 390 tons of water in three hours; all engines and suction pipes together might perhaps manage to throw the same quantity—or, 800 tons, in round numbers. Well, there must be at least 3,000 tons of water in the *China*; besides, she is stuck in the mud about 12 feet deep; so that on the whole there may be good reason for the doubters shaking their heads even at a big centrifugal pump. How deeply she has sunk into the mud-bank may be imagined from this circumstance. At half-past five yesterday morning hawsers were attached to her from the powerful tug *Colaba*. The tug got up steam, but not an inch would the *China* budge. The idea of those who tried to move her was that if she did move, a vacuum would be created beneath her which might help to send her up. To-day the centrifugal pump and every other available pump will be set to work, and another attempt will at the same time be made by sheer haulage to dislocate her from her abode in the mud. Should these combined efforts fail, it is difficult to imagine what will be done with the luckless vessel. The neap tides will have to be waited for, more pumping power will have to be applied, and then perhaps we shall see the *China* once more floating in the harbour in her pride of place among the rest of the shipping. In the meantime, her interior is a scene of melancholy desolation. We popped our head through the skylight to have a look at the saloon, once splendid with gilding and polished maple; but we had quickly to withdraw it as the stench of bilge water was disgusting. But we saw enough in that brief glimpse to make even a Cornish wrecker sad. The saloon was simply a dark pond of dirty water, and black unhealthy-looking crabs were crawling over what once were gilded cornices. Crabs and dirty water in the saloon which was wont to echo with the silvery laughter of hopeful spinsters on their way to India! and the table which used to look gorgeous with flowers, epergnes, and silver things galore, invisible for the alms of Bombay harbour! Speak of the desolation of the Halls of Balclutha after that. By the way, the rats had every reason to regret the *China's* catastrophe. Driven out by the rising water, they rushed in hundreds—some say thousands—over the deck, up the rigging, up the funnel (down which a good many of them fell again)—anywhere, in short, where a desperate quadruped could find a footing. A dog-maniac would have been in Paradise if he had been there with his bull-dogs and terriers. Besides the rats, we should think a good many shippers have been rendered disconsolate by the scuttling of the ship. The whole of the cargo in the fore-part of the *China* was destroyed by fire, and what remained elsewhere has since been spoiled by water. We were sorry to hear also that all the stewards lost everything they possessed except the clothes they stood in when the ship went down. In short, the *China*, as the representative of a very deplorable accident to the P. and O. Company and others connected with them, is worth seeing at the present moment.

The *China* had not left her soft bed in the Mazagon mud-bank on Tuesday night, though strong hopes were entertained that she would be once more afloat with Wednesday morning's tide. On Monday night, or rather early on Tuesday morning, when the tide reached a point sufficiently low to admit of operations being commenced, the Port Trust big centrifugal pump and the host of smaller pumps gathered together on the spot were set going, and work set away with a will, and with such good effect that the water

within the vessel sank lower and lower till its surface did not reach within two feet of the main deck; but at this juncture, something went wrong with the big pump, and before it could be set right, the tide rose again with its steady, overpowering advance, and soon filled the ship as full as she was before. On Tuesday, another powerful pump was procured, from Messrs. Glover and Co., and was fixed on the deck, and during the afternoon both it and the Port Trust pump were set working to test them, and were found to answer admirably. It was intended to set them to work in earnest about two o'clock this morning (nearly low water), and it was hoped that before the tide began to make again, the ship would be relieved of so much of her heavy burden of water as to enable her to rise and float. Should this effort prove unsuccessful, we presume they will endeavour to raise her by other means, and perhaps more efficient, though more tedious and more costly means.

We are glad to say that on Wednesday morning (15th) the first favourable symptoms in the case of the China were observed. At a very early hour two powerful centrifugal pumps were placed in position, and when the tide commenced to ebb, they were set agoing, and everybody worked away with a will at the minor suction pipes that were stationed on flats round the steamer. At ten minutes past seven the ship was felt to "shudder"—everybody listened or felt, and she was distinctly observed moving again. It was true that she moved but slightly, but even that little motion betrayed the important fact that she had dislocated herself from the mud-dock she had made for herself far down. Work was renewed with increased vigour. The tide was rising rapidly again, and the question was, would it rise soon enough to engulf her again? Hundreds of men pumped as if for dear life. It was a race between human skill and labour against the inexorable powers of nature. The tide still rose and rose, despite the utmost efforts of the crew. They thought that the tide must beat them. But it did not. It kept rising and rising; the men wrought with redoubled energy; and at last the tide stopped about ten o'clock just four inches below the gunwale. It was a "near thing," and the sense of relief felt by Captain Alderton and his men was indescribable. They rested a little, and set to work again full of hope. As they did so, the steamer moved more and more, and observations made on shore showed that she had drifted by noon fully twenty yards through the yielding mud. Last evening considerable progress had been made in draining her. The saloon was quite dry, though wofully besmirched, and we are told that the rats that had perched themselves on the masts came down again with as much cheerfulness betrayed in their stealthy steps as they could possibly show. The ship was altogether about ten feet high and clear out of the water. She looked sadly bedraggled and dirty, and the stench issuing from her bilge water and rotting cargo was something awful; but in the course of a day or two, we hope she will be all right again and none the worse of her unfortunate bath. When she is quite pumped out, she will be docked;

then she will be scraped and painted, and on the outside, at all events, will look as smart as ever, though we are afraid she will have to go to England to get her saloon and cabins made as fresh-looking as of yore.

On Thursday morning (May 16th) the Steamer China was floated completely off the mud-bank and was towed to one of the P. and O. Co.'s regular moorings. We regret to learn, however, that she is drawing such a depth of water (something like 27 feet) that she cannot be towed into dock, and there is a possibility that in order to save her she may have to be run on the mud-bank again. Captain Alderton and his men are hard at work endeavouring to avert this result, but their labours wear just now a somewhat doubtful complexion.

YOKOHAMA MARKET REPORTS.

FRIDAY EVENING, June 28th 1877.

IMPORTS:—The week has been passed in this market in a state of quiescence so nearly like total stagnation that we might with perfect propriety have altogether withdrawn this report. Quotations remain unchanged, as do the relative attitudes of buyer and seller. A few sales of yarn have taken place, but hardly anything has been done in any other goods. We leave our table of quotations in the same condition as last week and pass to the more interesting markets of our Export staples.

EXPORTS:—**SILK.** The Silk season 1878-79 may be said to have opened on the 20th instant with the arrival of four Bales of new Hachioji Hanks No. 3-3½ which after much deliberation were settled at \$490 per picul. On the 22nd inst. several more small parcels arrived, consisting of Takasaki and Mayebashi Hanks No. 2½-3 and they were sold at \$500 per picul, thus making in all 41 packed bales of new silk for the French mail of the 26th inst. In view of the unfavourable news from Europe, the prices paid for the first arrivals appear decidedly high, and probably it is only the wish to ship a few bales by the first steamer, which has prompted some of our buyers to open the Market at such high rates.

After the departure of the mail of the 26 inst., 27 Bales of Hachioji and 22 Bales of Mayebashi arrived: the former found buyers at prices ranging from \$470 to \$480 per picul, which already showed a drop of \$10 to \$15 per picul on the first purchases and the latter still remain unsold.

To-morrow, about 80 Japanese Bales more are expected, and it is highly probable that holders will have to submit to a further reduction. The quality of the new silk is fair, but as is usual with the first parcels, they are rather mixed. It now appears certain that the Japan crop is a very good one, and fully as much silk may be expected as last year.

We are still without sufficient business to justify tabulated quotations. Total shipments to date, season 1877-78 21,983 bales, against 21,178 Bales, season 1876-77. Shipments of new silk 41 bales. Stock, old silk about 300 Japanese bales; unsold new silk 22 bales.

TEA:—The market has been somewhat quieter during closing week, business done amounting to Pels 4,000 and prices ruling somewhat easier. First Arrivals of Second Crop are expected here in course of the coming week and the quality of these is reported as satisfactory.

EXCHANGE:—The weakness manifested in the closing rates for sterling in our last issue has continued throughout the past week and the market again closes with a declining tendency on quotations. A considerable business has been done in private paper at rates varying from 3s. 11½d to 3s. 11¼d. Demand for Bank drafts has not been on the usual scale.

On Hongkong and Shanghai a very moderate business is reported, and the same remark applies to Exchange on America.

MAILS DUE FROM:—Hongkong P. & O. str., July 9th; Hongkong M. M. str., July 3rd; San Francisco, P. M. str., June 26th
 Shanghai, Kobe and Nagasaki M. B. M. str., June 29th.

CARGO:—Per American steamer, *City of Tokio*, from Hongkong:—2,005 packages.

REPORTS:—The German barque *Hammonia* reports:—Left Takao on the 28th May: Experienced light head-winds during the entire passage. On June 14th exchanged signals with the American ship *S. F. P. K.* which wished to be reported 20 days out from Hongkong to San Francisco; 4 days in company.

The Japanese steamer *Hideyoshi* reports:—Left Singapore June 7th. Fine weather with monsoon to Formosa. Thence very variable with much rain.

The British barque *Flying Spur* reports:—Left London February 9th, and Downs on the 11th, landed pilot next day at Isle of Wight. Crossing Bay of Biscay, encountered S. W. gales. Had very light N. E. trades. Passed East of C. de Verde Island. Lost N. E. trades in lat. 5° N. on 11th March. The Equator was crossed on the 19th March (36 days out). Passed the Meridian of Cape of Good Hope 14th April, and passed Anjer 16th May. Had very light S. W. winds up the China sea to the Pratas Shoal (June 1st), followed by 21 days N. E. winds. When about 50 miles N. E. of Osima, the wind hauled to South with thick rainy weather; made Cape Idzu at 8 a.m. 22nd inst. and took a pilot off Cape Sagami at 2 p.m., arriving in Yokohama 11th 5m. p.m. 22nd inst.

The British barque *Earl of Devon* reports:—Left Plymouth on the 4th February last. Passed Anjer on the 16th May; and arrived in Yokohama on the 22nd June, having experienced both heavy gales and some fine weather during the passage.

The American steamer *City of Tokio* reports:—Left Hongkong on the 22nd June, 1878, with 28 cabin, 15 Europeans and 273 Chinese steerage passengers, 2,531 tons cargo, and 6 packages mails.

(All subscriptions are payable in advance.)

No charge is made to subscribers to the paper for announcements of Births, Deaths, or Marriages.

All subscribers to the paper are entitled to have their names and addresses recorded, on application—without charge—in the 'Professional and Trade Directory.' Merchants, subscribers to the paper, are invited to send to us Shipping Notices, such as:—to consignees to take delivery; disclaimers of responsibility for the debts of the crew; closing of ship's mail bags; announcements, or postponements, of departure, &c., &c. They will be inserted, free of charge, in our Shipping Intelligence.

The paper will be forwarded to our subscribers through the Japanese post. Subscribers who wish to forward copies of the paper to friends abroad, may forward to us the addresses to which they wish them sent; when they will be regularly dispatched, without charge for postage.

Subscriptions, Advertisements, and all business communications, should be forwarded under cover to

'The Manager of the JAPAN TIMES'

to No. 70, Main Street, Yokohama, the office of the JAPAN GAZETTE.

Correspondents' letters and other matter, intended for insertion in the body of the paper, must be addressed to the 'Editor of the JAPAN TIMES' at the same address.
